VOL. LX. No. 2658. NEW YORK, JANUARY 5, 1901. $1 PER YEAR

THE ESSENTIALS OF PEACH CULTURE.

A LIFE'S EXPERIENCE BOILED DOWN.

The Soil, the Tree and Its Care.

FIRST OF ALL.—Several years ago, in an article on peach culture, I wrote what then seemed to me to be "the ten commandments of peach culture"; they were widely copied, and I am told have been very helpful in leading many to the heaven of a good and profitable peach orchard. Now I have forgotten just what those "ten commandments" were, but am going to take it for granted that some of them are now out of date, and in reply to THE R. N.-Y.'s demand for some of the leading requirements to the successful culture of the peach, may break the whole ten, for the fellow who gets his living by peach growing is learning and unlearning some things all the time, yet I hope continually growing in grace. The first and greatest essential to success, is a love of Nature; trees, plants and living things; a pleasure in their care and development; a love of peaches because they are so beautiful, as well as good, and a genuine enjoyment in producing the finest peaches that can be grown, regardless of whether there would be any money profit in such production. "Horse sense" and good business judgment, with the "under-dog" habit of never knowing when you are whipped, are further requirements; and abrupt elevations of lands that are reasonably free from water, and that furnish quick frost and air drainage.

THE SOIL.—A warm, light, loamy soil is best, yet about any except a stiff clay will answer, if other things are right. I used just to dote on commercial fertilizers, but am now convinced that with culture enough (and yet who will ever give culture enough?) there is not the necessity for the great amounts of fertilizers we have been applying. Rocky hill lands that have been just a little too tough a proposition for good tillage in the past, make an ideal foundation for a peach orchard; there is color and flavor for peaches in these rocky old hills, and it is cheaper to remove rocks at odd seasons of the year than to buy fertilizers. I have already reclaimed two so-called abandoned farms, and have 125 acres of promising orchard among the rocks, or where they once were. Have now tackled another 50-acre tract of rocks, trees and brush, properties that I would not have taken as a gift eight years ago, and so bad now that agricultural college trustees, members of State boards of agriculture, high officials in the Grange, professors of horticulture and other "visiting statesmen," all shake their heads and say, "I don't know"; one or two more outspoken than the rest even went so far as to say I was "peach crazy" and "stark mad" to waste money on such rough lands, when good cleared land could be bought at less than the cost of clearing this; well, perhaps so, but if I don't get more fun and profit out of the rough-land peach orchards than some fellows do on their so-called "better land" it will be a surprise party to me. Digging out rocks beats subsoiling, yet where the rocks are out of the way, it will pay to use a subsoil plow before planting the orchard, except, of course, where lands have sandy or gravel subsoil; and if the land is too rough to lick into shape, don't plant the trees the first year; just plow the best you can, and sow cow peas broadcast thickly; they are great helps in breaking up land, besides enriching it.

GET BIG TREES.—When ready to plant trees, get big ones. I have planted nearly 400,000 peach trees in orchards the past 20 years, nearly all June-budded or else light to medium-sized one-year trees, with occasional lots of heavy No. 1 or extra-sized trees. I have fooled myself with "good medium three to four-foot trees" long enough; from now on give me the big ones; five to six feet high and three-quarters-inch caliper will lay the foundation of a better orchard than any smaller size. I really care nothing about the top, so long as you can get a heavy root and strong cane 15 or 18 inches up; you will cut away the rest anyway, and so be in shape to build any sort of top you may. Distance apart; well, here is where the man comes in again, and then the locality; I have made the most money North and South planting 13 feet apart or closer each way. Of course, it means a lot of pruning, while wide-apart planting tempts neglect of this most necessary operation with the peach tree. Still, taking human nature as it is, I cannot advise the other fellow to plant very close, 18 to 22 feet apart each way will doubtless give the best results; planting closer in the South than in the North, where trees are inclined to more wood and foliage growth. Don't plant any so-called "catch crops" in a young orchard; you'll catch it if you do; plant horse and mule legs in plenty, up and down and across, between the peach trees, their hoof prints will do no harm if harrows and cultivators follow close behind. At least once a week for the three best growing months of May, June and July in this latitude allows 12 to 15 good cultures, and if you throw in a few more for good luck, the trees will smile on you for it.

GREEN CROPS.—The first two years, after a month or six weeks of thorough culture, seed to cow peas over two-thirds the space between the rows of trees, leaving space enough for good single-horse culture up and down each side of the trees for two months more. Leaving the pea vines on the ground as a Winter mulch will be less loss than to plow them under, and so have bare ground all Winter. After two years of peas in an orchard the tree roots should reach out through the whole orchard, and should have the whole run of it to feed and drink upon during the rapid growing months, when the liveliest culture is being given. If culture has been what it ought from opening of Spring down to last of July or early August, trees will be growing so fast that they can't well stop before Fall, and the whole ground should be seeded to clover at the last cultivation. I consider 15 to 20 pounds of seed per acre is little enough for a thick clover carpet over the ground through the Fall and Winter, and is a great protection to peach roots. Plow this clover under early the next Spring; don't fool yourself into letting it grow a few weeks in Spring, so as "to have a lot of stuff to plow under"; six weeks of the best peach season's growth can easily be checked by allowing the clover to grow two or three weeks after it's time to Spring-plow the orchard. The time to begin Spring culture in a peach orchard is just as soon as the soil can easily be worked after frost is out.

PRUNING.—As to pruning, a light open head is what is wanted; don't shorten in too much of first year's growth. The second year shorten pretty liberally all the strongest branches, and let the side branches spread so as to make a broad low head. After the second year, cut away most of the strong leaders entirely every season; if in any instance it seems best not to cut one entirely away, never cut it back to a dormant bud, but always to some side branches; these will slowly take on growth and great fruiting strength, and check the upward tendency of growth that is sure to follow the cutting back of a strong peach limb to a dormant bud. Don't bother much with the little side branches, high or low, that will never make leaders. Most pruners like to slick up the trunk and main branches of a peach tree by cutting these all away. It is a fruiting mistake to do this; pruning a peach tree as here suggested should give three-fourths of the fruit near enough to the ground so that it can be gathered without the use of stepladders. Learn to know yellows in a tree at sight a year or two before it hangs out its sign with "pennyroyal sprouts" or prematurely high-colored fruit. Promptly pull and burn all yellows-infested trees, no matter what other job you may have

THE OTAHEITE ORANGE. FIG. 1. SEE RURALISMS, PAGE 6.

on hand; attend to the yellows first. Feeding, as growth or lack of it seems to demand; fruit thinning, picking, packing and marketing and perhaps at times spraying when the trees are dormant, all require close attention, yet the points I have touched are the foundation to build a successful peach orchard upon.

Connecticut. J. H. HALE.

FEEDING MUSCLE-MAKERS INTO PLANTS.

FERTILIZER NITROGEN VS. CROP NITROGEN.

An Increased Value of Hay.

PART II.

INCREASING FEEDING VALUE.—In the experiments with mixed grasses, the nitrogen in the fertilizer increased very considerably the yields of hay, and, also, to a marked degree, the proportion of protein in the crop. The feeding value of the crop, where the largest quantities of nitrogen were used, was, therefore, much greater than on plots where little or no nitrogen has been used. On the whole, the most economical returns in yields were obtained from plots where nitrate of soda was used at the rate of 320 pounds per acre (equal to 50 pounds of nitrogen). The increase in yields due to the nitrogen is shown by the following table. The mineral fertilizers were uniform on all the plots except the one where no fertilizer was used, and the results on the separate plots are the average of three years' experiments. On the plots to which nitrogen was added the results are the averages from the use of nitrate of soda and sulphate of ammonia, on plots supplied with uniform quantities of nitrogen. Similar experiments to these were made with distinct kinds of grasses, and the effects of the nitrogen in increasing the protein of the crop was even more striking than in the case of the mixed grasses:

Nitrogen per acre.	Relative yield of hay per acre.
No fertilizer	1,881 pounds
No nitrogen	2,664 pounds
Nitrogen, 25 pounds	3,645 pounds
Nitrogen, 50 pounds	4,727 pounds
Nitrogen, 75 pounds	5,015 pounds

DIFFERING RESULTS WITH CORN.—In the experiments with corn the effects of the nitrogen in increasing the yield of the crop, especially where the larger quantities of nitrogen were used, were not so marked as in the experiments with mixed grasses. As was pointed out in the first part of this article, soluble nitrogen compounds like nitrate of soda and sulphate of ammonia are readily leached out of the soil in seasons of heavy rainfall. When these materials are used in large quantities for corn, much of the nitrogen may be lost before the crop can make use of it. At any rate, a large series of experiments made by the Storrs Station indicates that there is little economy in using nitrate of soda or sulphate of ammonia in amounts sufficient to supply over 40 to 50 pounds of nitrogen per acre when the yields alone are considered. When the proportion of protein, in both the seed and the stover are taken into account, however, even larger amounts of nitrogen than these may prove profitable. On the whole, it seems more desirable to use about 200 pounds of nitrate of soda or its equivalent of sulphate of ammonia (160 pounds) in connection with stable manure or green manuring. The following table makes clear the fact that the larger quantities of nitrogen have caused relatively little increase in the yields :

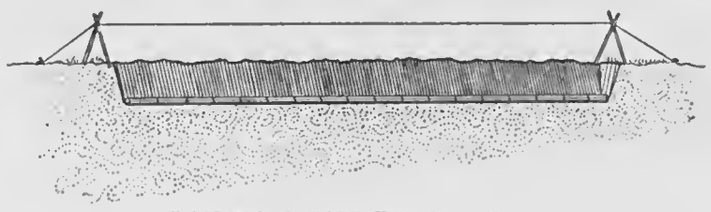
Nitrogen per acre.	Relative yield of corn (grain) per acre.
No fertilizer	1,197 pounds
No nitrogen	1,778 pounds
Nitrogen, 25 pounds	2,399 pounds
Nitrogen, 50 pounds	2,937 pounds
Nitrogen, 75 pounds	3,004 pounds

As will be seen farther on in this article the larger quantities of nitrogen did increase the yields per acre of protein to quite a marked degree. While the total yield of grain was increased only 67 pounds where 75 pounds of nitrogen were used over that obtained where 50 pounds were used, the actual protein in the crop was 60 pounds greater where the larger quantities of nitrogen were applied.

NITROGEN ON LEGUMES.—When we come to the consideration of the effects of nitrogen on the legumes, such as cow peas and Soy beans, the experiments tell a very different story. On these two crops there was a decided contrast in the effects of the nitrogen in the fertilizer upon both the yield and the percentages of protein as compared with those obtained with corn and with grasses. In experiments covering a period of five years with cow-pea fodder the yields obtained on plots where only mineral fertilizers (phosphoric acid, potash and lime) have been used, have been very nearly as great as on any of the plots to which nitrogen was added with the mineral fertilizers. The following table shows the poor result obtained from nitrogen:

Nitrogen	Relative yield of cow peas (green fodder) per acre.
No fertilizer	9,660 pounds
No nitrogen	18,485 pounds
Nitrogen, 25 pounds	19,265 pounds
Nitrogen, 50 pounds	18,465 pounds
Nitrogen, 75 pounds	18,100 pounds

What is still more interesting, the effect of the nitrogen on the percentages of protein in the crop is much less on the cow-pea fodder than upon the grasses or corn. The value of the nitrogen to improve the feeding value of the crop is shown in the table which follows, which gives the percentages and the yields per acre of the protein. It may be seen that the yields of protein for the cow-pea fodder are essentially the same on all the plots irrespective of the amount of nitrogen used in the fertilizer. In the case of the Soy-bean seed there was a slight increase



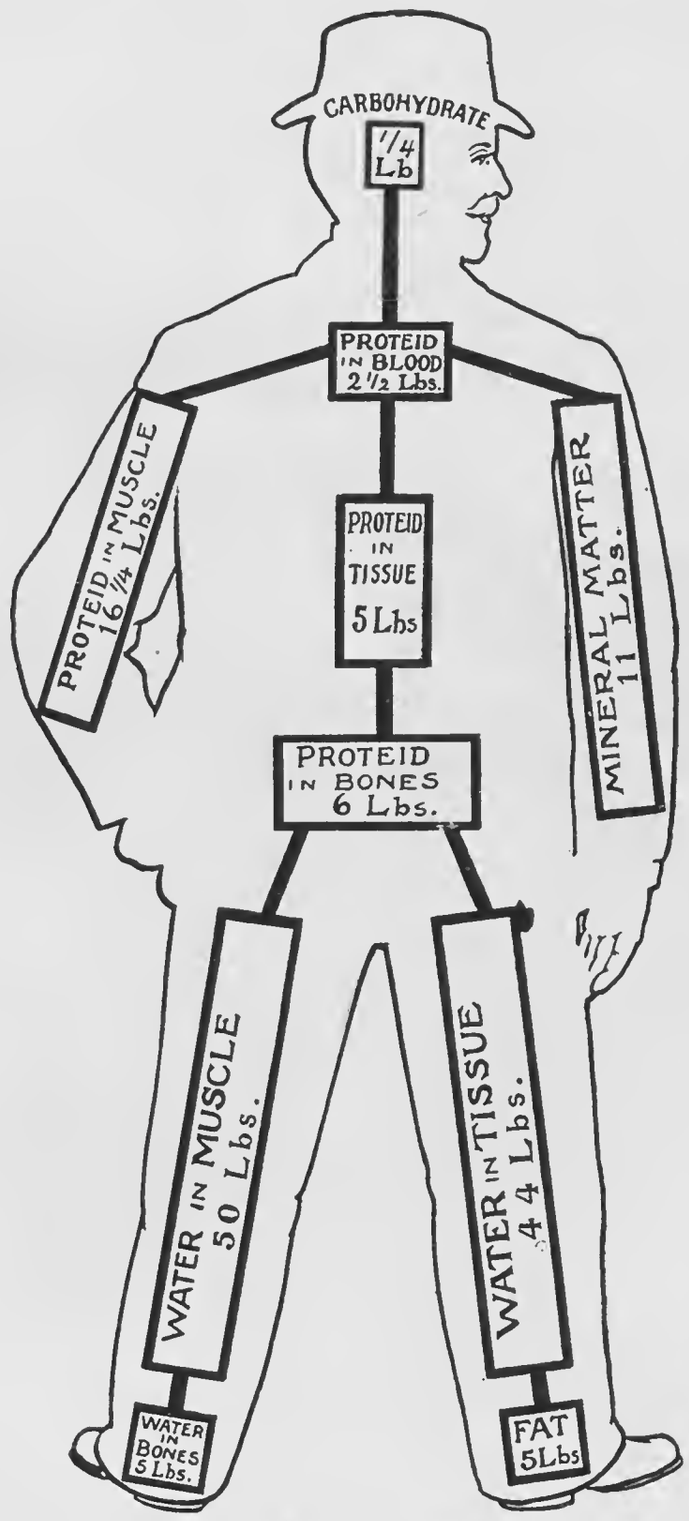
LAYING A TILE DRAIN. FIG. 2.

in protein corresponding somewhat with the amount of nitrogen used. However, the increase in protein for this crop as effected by the nitrogen was much less than with the grasses and corn.

Per cent in the dry substance of protein.

Fertilizers per acre.	Mixed grasses. per ct.	Corn. per ct. (in grain).	Cow-pea fodder. per ct.	Soy bean secds. per ct.
Mineral fertilizer	7.83	10.13	18.37	39.30
Minerals & nitrogen, 25 lbs.	7.73	10.54	18.04	39.93
Minerals & nitrogen, 50 lbs.	8.46	11.05	17.69	40.71
Minerals & nitrogen, 75 lbs.	9.39	11.88	19.14	41.47

VALUE OF COW-PEA FODDER.—One point of interest to which I would like to call attention here is the large yields of protein per acre obtained with cow-pea fodder as compared with the total yields from mixed grasses and from corn including the stover. The average yield of the mixed grasses, on the most heavily fertilized plots, was 2½ tons per acre of thoroughly dried hay, which gave 4,458 pounds of dry matter and 432 pounds of protein. The average yield of cow-pea fodder from the plots with mineral fertilizers only was a little over nine tons of green crop,



A DOMESTIC SCIENCE MAN. FIG. 3.

equal to 3,850 pounds of dry matter and 666 pounds of protein. The total yield of protein per acre from the corn and stover was 486 pounds on the most heavily-fertilized plot. These experiments lead to the conclusion that the farmer who considers only the total yields of fodder obtained from his crops is leaving out of account one of the most important phases in the management of the farm, especially if it be a dairy farm. The farmer needs to study the feeding value of the crops he raises as well as of those which he buys. Only in this way can he realize the full benefits derived from the fertilizer or manure which he uses. As yet the markets do not recognize any difference in the feeding value of the hay due to differences in composition, but the farmer who feeds the hay from his most heavily-fertilized meadows and sells that from the poorly-fertilized fields would certainly be practicing a shrewd bit of economy.

[Prof.] C. S. PHELPS.

TALKS ABOUT DRAINAGE.

How to Lay the Tile.

We have a piece of land with a wet strip from two to four rods wide running through it. I would like to know how to tile it. Would one row through the center be sufficient, or would it require more? How many and how deep should the tiles be laid? J. K.

Cresco, Iowa.

First see that you have a good outlet for the water. Second, dig a narrow ditch along the center of the wet strip deep enough to drain the land, say three to four feet, according to the nature of the soil. If it is liable to settle down much after the water is drawn off it should be deeper than it would otherwise. Trim the bottom of the ditch carefully to a true grade. A string stretched over the center of the ditch is a very efficient help in getting both line and grade. See Fig. 2. The line of the tile should be as straight as the circumstances will permit, and the tile laid to a true grade, which may be ascertained exactly by measuring down from the string. A sag in the tile is sure to be filled with silt sooner or later, destroying its usefulness. A single line of tile through this tract ought to drain it of surface water, the size of the tile depending on the extent of the tract and the amount of water coming into it. In any case I would not use smaller than four-inch tile. If there are springs they must be provided for. When the bottom of the ditch is very truly and carefully brought to grade the tile may be laid end to end along the bottom, the joints covered with an inverted sod or its equivalent to keep loose dirt out, and the ditch filled up. If the grading string is used to measure down the tiling may be laid and covered as fast as the ditch is dug, commencing at the outlet. F. HODGMAN.

The Effect of Tile Drainage.

I have been told that in parts of Illinois the tile drains have been taken up, because they took off more water than was necessary, and were the ruination of Illinois bottom lands. I am interested because I have 40 acres of land which, in a fairly dry season, has raised as high as 85 bushels of corn per acre, but ordinarily it is too wet, and my only resource has been to ditch it. I have just been putting another ditch through it this week (couldn't do this in December every year), but find that the ditches take up too much land. As we list all of our corn in this section of Nebraska it necessitates running the rows the same way every year. Not only this, if the land was tiled it seems to me that all of the rich soil which washes down from the upland would remain upon the bottom land, while if ditched, would pass on down, depriving the land of this cream of soils. What is the truth? C. V. D.

Nebraska.

We have been quite fully informed for 20 years with the progress of land drainage in Illinois, having attended the drainage conventions for 20 years past; have corresponded with hundreds of persons interested in land drainage; have viewed several of the large drainage districts; have visited many of the large farms where systems of under-drainage were being constructed; have observed carefully the effects and have never heard it claimed by anyone before, that tile drains "took more water than necessary". Neither have we heard it asserted at any time, by anyone, or through the press, or otherwise, that "tile drainage was the ruination of Illinois bottom lands". To the contrary, we know of thousands of acres of low-lying bottom lands that have been reclaimed by under-drainage and have been yielding magnificent crops for many years. Besides, there are great enterprises being carried forward, and others being planned, looking forward to the reclamation of large areas of bottom lands in Illinois and other States. If tile drainage has the injurious effect claimed by C. V. D., the wideawake, energetic capitalist would soon find it out and discontinue the work.

In the pioneer work of under-drainage in Illinois and other States, many of the tile drains were poorly constructed, were too shallow, and the tile was not laid true to the grade, which after a few years did not work well for the reason that the silt settled in the depressions, almost filling the tile until the drains were practically worthless. In many such cases the drains have been taken up and replaced with larger tile, laid, in many instances, two or three times the depth of the first tile. In other cases the first lines of tile drains were ignored altogether, and a new system of drains put in at a greater depth, using larger tile and all requisite care as to grade, joints and connections. The necessary information as to the why and how to under-drain has been so widely diffused in the past 20 years that there are now few mistakes made, comparatively speaking, in the work of tile drainage. To illustrate more fully the progress which has been made, it was common in the pioneer work to use two or three-inch tile in the construction of lateral drains, but it was soon found that larger tile did better work, so that at this time very few if any two-inch tile are used, only a few threes, and most of the leading men in the work of land drainage will not use a tile less than four inches. If there was any trouble arising from the tendency to carry away too much water, as claimed by C. V. D., the change in sizes of tile used would be to smaller sizes, so as to lessen rather than to increase the capacity of the drains. Referring again to bottom lands, there are some that are naturally under-drained by underlying strata of sand and gravel, that do not need to be tile-drained. Again, there are bottom lands, thousands of acres, where the water level in the soil is so near the surface in the early part of the season, that under or tile drainage is the only means by which these large areas of rich land can be made available for agricultural purposes.

In the early settlement of the State the prevailing opinion as to the future of the low-lying acres of bottom land was that they would never be available for agricultural uses, but the beneficial effects of under-drainage have worked a change in the crops grown, and the betterment of the sanitary conditions of the country has been so marked that land values have gone up to very high marks. In many instances $100 per acre and even higher figures are paid for them; lands which before being tile-drained were held at $5 per acre and even less. Such are the facts as we find them to-day, notwithstanding the sayings of others to the contrary. J. J. W. B.

Indianapolis, Ind.

THE FARM INSTITUTES OF WISCONSIN.

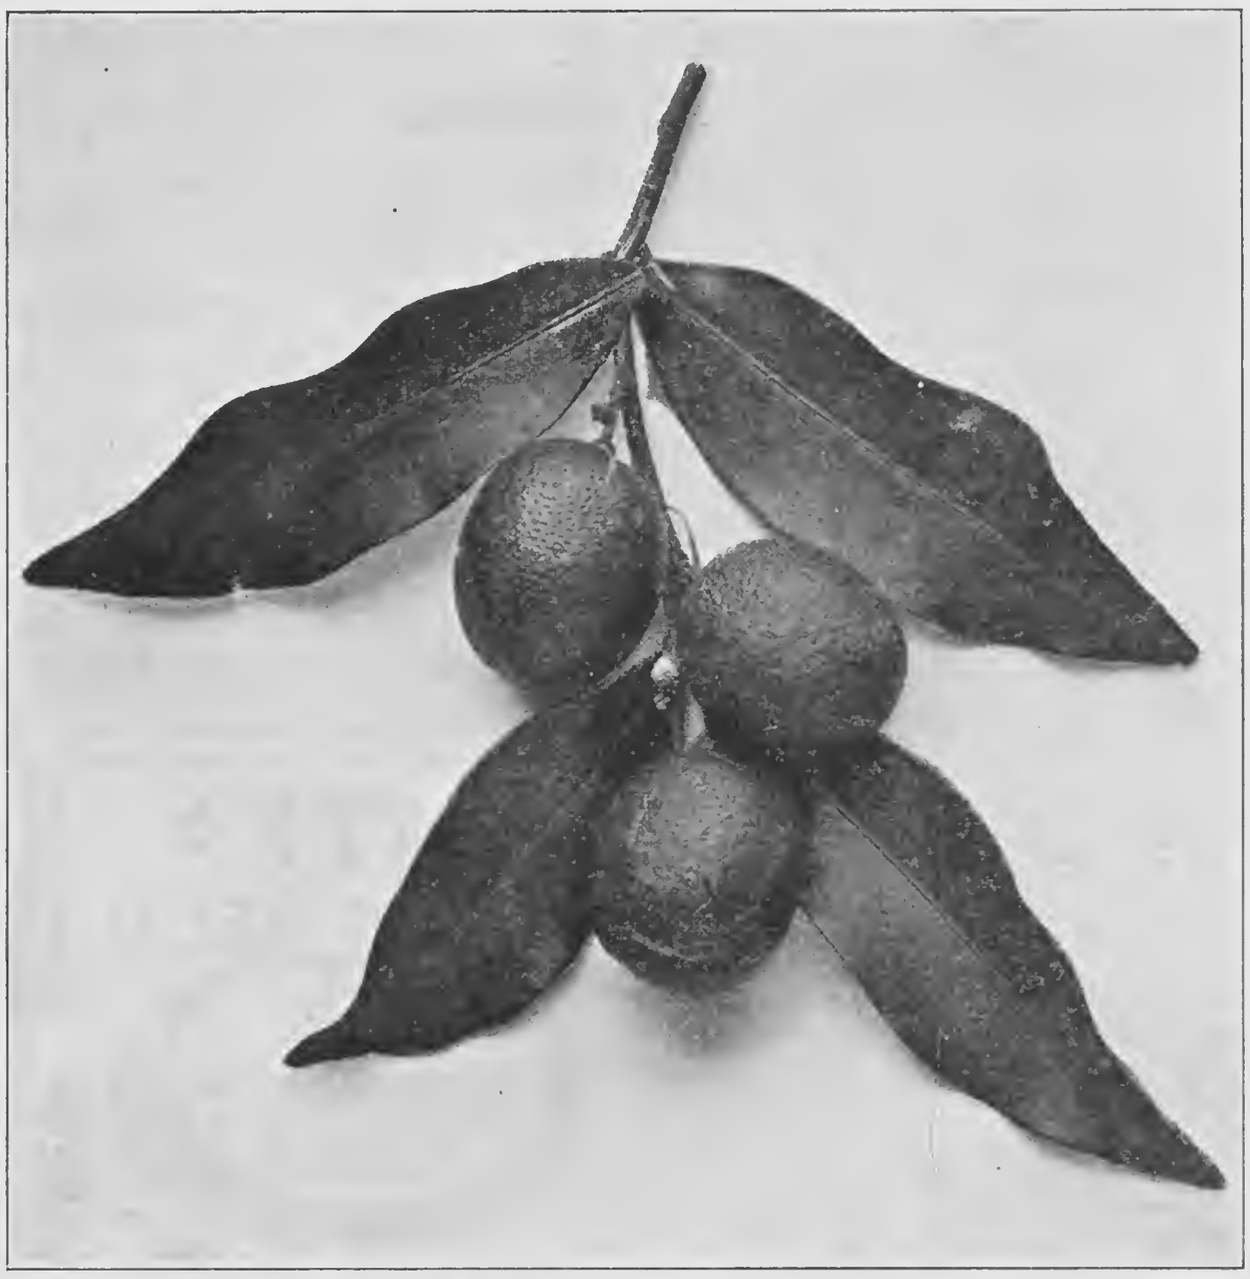
Of the Farmer and for the Farmer.

During the first three months of the coming year there occur in Wisconsin 101 meetings, composed of the most intelligent and wideawake farmers in the State. For two days, through five sessions of two hours each, these men and women will discuss in an intelligent manner, the topics of greatest interest to them, relating experiences of past efforts and suggesting methods for the future. All of these discussions are led in the right direction and controlled by a "conductor," who suggests the topics and opens the way by a 20-minute talk. These conductors are all practical farmers, owning and successfully operating farms in Wisconsin. In many instances a cooking school is held in connection with the other meetings, conducted by an expert cook. In these, the line of work is of quite as great interest as the other meetings. This, in brief, is an outline of the farm-institute work in this State. This is the fifteenth year of the existence of this branch of agricultural education, during which time over 1,500 meetings have been held. The institute work is one of the three main divisions of the Agricultural College of the State University, the experiment station and the college courses comprising the other two. Of these three, the experiment station is designed to solve some of the problems of greatest import to the farmer. Well-trained experts are constantly at work aiming to discover Nature's secrets. How may we most easily unlock the plant food in the soil? What is the history of these millions of organisms in a drop of milk, and how can we control or destroy them? All these things accrue to the good of the farmer, but they are of necessity slowly evolved, and the end sought is too often obscured by terms and methods not familiar to him.

The college courses are more popular, especially the short course, which is patronized almost wholly by farmers' sons, but not every one can come to Madison even for 14 weeks in the Winter. Therefore further to extend the work, the institute system of agricultural education has been devised, to bring to the very doors, as it were, the information needed, and an opportunity for the interchange of ideas. The largely-increased attendance at the meetings, the enthusiasm manifested, as well as the growing demand for meetings, is evidence of the popularity and value of the work. The institutes are located only on petition, the petitioners agreeing to furnish a meeting place with heat and light, the central management attending to the rest. One hundred and fifty-one petitions were received last year, but the means at command allowed of only 101 meetings. One hundred of these were located in the remoter parts of the State, and mainly in new territory, while the last or "round-up" meeting is usually held in one of the larger towns. This is an event of very considerable importance and very largely attended. For this occasion, "imported talent" is largely employed, and a Winter fair or exhibition of farm products is held, with a prize list offered by the merchants of the town. The proceedings of the "round-up" are printed in full in book form, to be distributed free to all interested. This is an extremely popular publication and the annual edition of 60,000 copies is always exhausted before a new one is issued. By an enactment of the Legislature, one copy is sent to each school district in the State, to be put in the school library. The distribution is effected in part through the agricultural press of the State, as the publishers forward the book to subscribers, on request.

While the general supervision and control of the work is in the hands of the regents of the University, the real direction is delegated by them to a superintendent. It is plain that the success or failure of the work must depend largely upon this superintendent. For the past six years this position has been filled by Mr. George McKerrow. The splendid success of the work and the increased confidence and interest are the best evidence of his fitness for the position. Another evidence is his large stock farm operated very successfully by him for many years, previous to taking up the institute work. As a breeder of purebred horses, cattle and sheep, he has been well-known to the stockmen of the State for over a quarter of a century. The students of the short course, when engaged in competitive stock-judging, never fail to visit the McKerrow farm, for here may be found one of the finest flocks of purebred sheep in the Northwest. Mr. McKerrow is a man of excellent attainments and knows farming and the farmers of Wisconsin, and gets very close to them in his work. The same is true of the conductors. Their talks are not those of the man who gleans from the written work of others, and adds to this his own dreams of the way things ought to be, while his own barn door is off the hinges and his cattle are subsisting on such protein and carbohydrates as may be found in the straw stack. It cannot be justly charged against any man connected with the institute work that he is not a successful, practical farmer, and herein lies the secret of the grand success of the work; it is of the farmers, for the farmers and by the farmers. It costs the people of the State $12,000 a year to maintain the institutes, one-half of which is absorbed by the expense of printing of 60,000 copies of the bulletin. A portion of the returns may be found in the census statistics of Wisconsin's farm products, but the larger benefits are not thus expressed. The knowledge derived, the power accruing from this knowledge and the contentment following, are not reducible to any form available to the census taker. The institutes in Wisconsin are free from any political taint whatever. Only once did the politician ever attempt to gain admission, and then the door was slammed in his face so forcibly that no further attempt has ever been made.

FREDERIC CRANEFIELD.



NAGAMI OR OVAL KUMQUAT. Fig. 3. See Ruralisms, Page 6.

A DOMESTIC SCIENCE MAN.

A woman who is studying domestic science work sent us, through a friend, a chart from which the drawing shown at Fig. 3 was made. The following lines were written under the chart:

See this new and beautiful man
Made on a domestic-science plan!
Water makes up most his weight,
Proteid as I indicate;
Mineral matter is also great,
Just a little of carbohydrate.
Fats are needed, may I state?
What he *is* I leave to fate.

We trust that fate will be kind to this poor combination of water, minerals, fat and proteids, and if fate take the form of a domestic-science woman such kindness is probably assured. The man weighs 145 pounds. Of this 99 pounds, or 68 per cent is water. As he puts on fat this proportion of water will grow larger. It may shock some of our solid citizens to be informed that they are composed so largely of fluid, but it should be an incentive to them to make up the proportion of solid matter by putting more sand or mineral matter in character and will.

PEACH TREES ON BLACK WALNUT ROOTS.

A Big Story from Kentucky.

Not long since I was attending the State horticultural meeting in Elizabethtown, Ky., the county seat of Hardin County, which is in the Blue-grass region, and noted for its fine horses and rye whisky. Before the hour for the meeting to convene I was introduced to the various officials in the court house, and among others to the county judge. Being a very genial and communicative old gentleman, and knowing that I was there in the interests of fruit culture, he very kindly proceeded to tell me of the fruit industry in Hardin County. He began by announcing that I might not know that the largest and best peaches in the whole country grew there. He said they had been sold as high as $12.50 per bushel, and that I might know just how they grew such fine peaches he said the trees were "grown on Black-walnut roots." At this rare information I smiled audibly and said: "See here, Judge, don't try to guy me in that way; no kind of peach tree will grow on any such root." This evidently nettled him, for was he not the judge of the county court, and his honor and veracity unimpeachable? The latter I did not doubt and I respected his white head, but I at once thought of the close proximity of the Ohio nurserymen who have such marvelous peach trees and other things to sell, and that possibly they had been doing missionary work in Kentucky. So I asked the Judge whether they had not been favored with those wonderful trees from north of the Ohio River. "Oh! no," he said, "they are budded right here. We have men who know all about fruit culture. You know the peach borers do not work in Black walnut roots, and the trees grow wonderfully in our rich soil." To this I could only reply, that I did not doubt his belief in this new mode of growing peaches, but that I did not; and I bade him good morning after some conversation on other topics, leaving him of the firm conviction that I was a hardened disbeliever in the greatest secret of modern peach culture.

A few days later I was at a meeting of the Maryland Horticultural Society in Baltimore and there confided the secret method to Roland Morrill, of Michigan; J. H. Hall, of Connecticut, and other noted peach growers who were present; but somehow they did not say they would adopt it. With all the eloquence I could command I tried to show Mr. Morrill the advantage of $12.50 per bushel over the $7.50 he was able to get for the best of his peaches in 1899, but it was all in vain. Perhaps our friend, Prof. Massey, of North Carolina, will catch on to the idea, and try it for growing new-fangled pears or quinces. Doubtless all the pears or quinces grown on Black-walnut stocks in North Carolina or elsewhere, will have seeds nearly as large as walnuts and with kernels as rich as butter and as sweet as honey. For, why will not "the new horticulture" work as well in North Carolina as it does in Kentucky?

H. E. VAN DEMAN.

A STEAM HORSE IN CALIFORNIA.

We have been using one of the Daniel Best's 50-horse-power traction steam engines for seven years, and it has proved a grand success for plowing, harrowing and pulling a combined harvester. In plowing, we pull with it 16 10-inch plows, and plow about 40 acres per day. In harrowing, we pull enough harrows to cut the width of 60 feet, and harrow about 150 acres per day. In harvesting, we pull a combined harvester, with a cut of 25 feet, and have cut, thrashed, cleaned and put into bags ready for market 80 acres of wheat, 1,155 bags, 164,010 pounds, in one day. We cut and thrash about 3,000 acres of grain every season. In regard to the pushing or pulling of headers or binders we will say that they are entirely out of use in this part of California. We have never used our engine for hauling loads to market, as we are on the banks of the Sacramento River, and ship all our produce to San Francisco by river. However, these engines are used in lumber camps for hauling logs to the sawmills, and also in the southern part of the State for hauling salt and ore. There are six of these engines in use here in a radius of 12 miles and there would be more of them but that the price is $7,000, including the combined harvester, the engine alone costing $5,000.

Windmills for Electric Power.

C. T. H., Maine.—Is it practicable to use a windmill to develop electric power through a dynamo to run, say, a five-horse-power motor, or would the first cost be prohibitive?

ANS.—While a considerable number of attempts have been made to utilize wind power in developing electricity for lighting purposes nothing really satisfactory has yet been secured. The windmill as a motor is so unsteady, and it is idle so frequently that it is always necessary to use storage batteries in connection with the windmill. The storage batteries are themselves expensive, and it is very difficult to govern the windmill so as to get a sufficiently uniform rate of motion economically to charge a storage battery. It is necessary that the motion be quite uniform while this work is being done, and governors must be used to slow down the speed of the windmill when it is running too high, and in this way a large amount of the effective wind is lost and cannot be utilized in charging the battery.

[Prof.] F. H. KING.

Picking Potatoes by Machinery.

D., Mass.—Is there any machine known to you for picking potatoes? I mean after they have laid on the ground long enough to dry. I know that sometimes they are sacked from diggers of the Hoover pattern, but it is desirable that they be allowed to dry somewhat before being piled together. It seems strange to me that we should have machinery for doing all the work about this crop except picking them up, even to cutting the seed, and that's an easy job, a sitting-down job, a regular lazy man's job, compared with that back-breaking, man-killing, drive-the-boy-off-the-farm job of picking up the crop. It doesn't seem creditable that we should continue to gather the millions of bushels of potatoes that we grow every year in this fashion. Here is a demand. Who will supply a machine to do the work?

ANS.—We expect that the human hand will have a monopoly of picking potatoes and milking cows for a good many years to come. We have heard of only one case where potatoes were picked up by machinery and that was reported last year. The Hoover digger was hauled by a traction engine. Behind the digger was a wide float or stone boat, and the potatoes were delivered upon it from the digger. This would not work at all on our own farm. After all, it is the finger and thumb and wrist movement that gives the small farmer every chance in potato growing and dairying. If it could all be done by steam or horse-power, where would the hand-worker be?

Late Cabbage in Iowa.

J. K., Cresco, Iowa.—We have two large towns nearby where we could sell cabbage at 10 cents per head if kept until February or March. I intend to follow plans for storage given in THE R. N.-Y. a few weeks ago. I would like to know what time to set out plants to have good solid heads, which will not burst. That is the greatest difficulty with us, especially in a wet Fall.

ANS.—We annually grow about four acres of cabbage for market, but always sell in October and November and let the buyer do the keeping. We could keep it if necessary though, but as we can always get four cents per head from the field we don't need to. We plant the seed in the rows where it is to stand, drilling it in rows three feet apart; and, of course, much thicker than we will need the plants to stand. For Surehead and Flat Dutch we plant the seed May 25 to 30, and thin out to a stand three weeks later. Very little trouble about bursting. That is caused by planting too early, or using too early varieties. We use horse manure the year previous; never have used fertilizers. They are unknown here. Varieties, Surehead or good strain of Flat Dutch.

Iowa. HENRY FIELD.

The Value of Wool Waste.

U. S. B., So. Hingham, Mass.—What is the value, or what are the fertilizing properties, of the waste from wool-scouring establishments? There is such a place 1½ mile from me, where they sell the waste at $1 per load; that is, all two horses can draw. I have used some in haphazard way, planted field corn with it on light sandy soil; stable manure on part of field gave equal results at greater cost. There seems to be a good deal of wool fiber, much of what is probably alkali soil from far western regions. There is a strong smell of sheep; it is heavy, and heats quickly. As it comes from their dusting machine it is fine and dry, but the pile is exposed to the weather, and becomes lumpy and greasy. I do not send sample, as I suppose the stuff is well known by those who answer such questions as this.

ANS.—Such waste varies greatly in value. There may be all the way from one to 10 per cent of nitrogen in it. At $1 per load it will pay. It is valuable chiefly for its nitrogen, which is very slow or unavailable until the waste is rotted. It has not been found good practice, we think, to plow the waste directly into the soil. It would be better to mix it with the manure, use it to absorb the liquids in the stable, or as a mulch for trees or bush fruits. It does not make good bedding, as it sticks to the cattle and is not clean. For use behind the cows as an absorbent it does well. When mixed with horse manure it is slowly rotted and becomes more available. We would certainly haul all we could get at the price named, but would not expect it to take the place of fertilizers or manure the first year. It must be rotted before the nitrogen will be ready for use.

Great Need of Phosphoric Acid.

G. H. M., Bradenville, Pa.—Why do you advise using more phosphoric acid than potash in a fertilizer when there is more potash in the ashes of crops?

ANS.—This question is an important one, and has received a great deal of consideration at the hands of experimenters. The chief arguments used to show that phosphoric acid should be applied in greater quantities than potash in a commercial fertilizer are that on the average, soils contain more potash than phosphoric acid. In fact, most soils contain sufficient potash to supply the needed requirements of maximum crops for very long periods, and when cultivation, proper tillage and management are used, this element may be readily extracted. In general farm practice, where grain and stock are sold, a larger proportion of phosphoric acid is taken from the farm than of potash, because the phosphoric acid is located chiefly in the grain, while the potash is chiefly located in the straw, which is usually retained and returned to the farm. In the growing of animals, too, more phosphoric acid is retained from the food than of potash. Phosphoric acid being the chief constituent of the bone, and potash being required in the animal body in very small amounts, hence in the selling of stock, phosphoric acid is the only mineral element largely removed. It has also been shown that phosphoric acid is much more essential in the early life of the plant than the potash. In the early growth of the various crops, phosphoric acid needs to be absorbed in much greater quantities, if maximum growth and uniform development are attained. For root crops, an abundance of "available" phosphoric acid will cause a greater development of root fibers, which will enable the plant to gather more readily the other food required. Or, in other words, phosphoric acid is particularly essential in hastening the growth of young plants. Experiments have shown that with the exception of light sandy soils and peculiar formations, deficient in feldspathic compounds, phosphatic manures are much more effective than potassic, probably for the reason just given. It is my judgment that, for general farming, the phosphoric acid should exceed the potash, but for certain other lines, particularly market gardening, fruit growing, etc., the potash should be used in larger quantities than is supplied by the average fertilizer, or that there should be a closer relation between the phosphoric acid and potash. That there is a tendency in this direction is shown by the composition of the average commercial fertilizer, which is much richer in potash than formerly.

Our Standard Kieffer Pear is enormously productive; handsome large fruit, good seller, ripens late. Gibson Strawberry, large, fine flavor, very prolific. Good shipper. Catalogue describes this and 50 other varieties. Send for it now.

HARRISON'S NURSERIES, Box 29, BERLIN, Md.

Catch Crops in Corn.

G. H. M., Bradenville, Pa.—Will the sowing of Crimson clover, oats and rye or cow peas in the corn at the last cultivation in June have any ill effect on the yield of the corn? Will they not act as weeds, use up the moisture and reduce the crop of corn?

ANS.—In some very dry seasons they will. We have known a crop of late sweet corn to be injured by the Crimson clover that was seeded in early August. Generally when there is moisture enough at seeding time to start the clover well both crops will get through. This year we waited until later and sowed oats and rye together. The corn made a good crop, and the smaller grains produced good pasture and Winter covering.

SUBSOILING ON NEW ENGLAND'S HILLS.

One of our readers wishes to know whether it will pay to subsoil-plow the gravelly soils of the average New England hills. Our own judgment would be that this would not pay except possibly for some such crop as Alfalfa, but we would like to know what good farmers have to say about it.

No; I do not think that it would pay to subsoil-plow the gravelly soils of average New England hills, unless there is a large quantity of stable manure to be applied. Of course, if the soil is made rich, it can be worked deeply with best results. G. M. GOWELL.

Maine Agl. College.

I have carried out an experiment in subsoiling on a level field of alluvial formation where the subsoil consists of a rather compact clay, so tenacious that in opening ditches for tile drains the workmen when digging by the rod preferred to use a pick. I had thought that subsoiling on land of this character must prove beneficial. The experiment was carried out upon a large scale. Two broad strips running through a field of fairly even quality, which was about 1,200 feet in length, were subsoiled, while similar strips adjoining on either hand were left without subsoiling. Manuring and all other treatment were the same for both subsoiled and unsub soiled strips. There was no appreciable gain as a result of the subsoiling. Of course our so-called gravelly New England hills vary widely in tenacity and texture of soil, but I think that most of them would stand less in supposed need of subsoiling than the field which was the scene of my experiment. I accordingly conclude that the probabilities are that it would not pay to subsoil such soils unless perhaps it should be for fruit trees. WM. P. BROOKS.

Mass. Agl. College.

I once made some practical investigations of subsoiling while connected with the Missouri State College, and with deep plowing both there and in Utah. The results were not favorable to subsoiling. An investigation of the results of other trials at other stations showed a balance against subsoiling. I found an increase of moisture in the subsoiled area, especially so in a wet year, it appearing that the compact subsoil of the Missouri land held it. It also appeared that in such seasons less water ran off subsoiled land, and that too much was retained. In any event, in a wet year the crops were decreased, and slightly more decreased than increased in a dry year. On the New England hills subsoiling among the rocks would be costly, and I judge from observation uneconomical. What is to be gained? When such soil is dug up (that is subsoil) and thrown back into hole made it will not fill it; in other words, it occupies less space than before. The action of frosts, earthworms and decaying roots loosens soils, and when the frost-expanded soils, perforated by roots and worms, are broken up and allowed to settle together less space is occupied. It is an error to suppose that roots cannot penetrate such subsoils. It is an error also to suppose that the roots of most of our crops care to go deeply. I have found that the bulk of roots are within the first four inches, where fermentation and decomposition are by far the most active. As agriculture in New England rests on the food from these processes and from artificial supply I hold that subsoiling will not be likely to be an economical and perhaps not even a helpful process in New England.

New Hampshire J. W. SANBORN.

PLAIN TALKS ON PLAIN TOPICS.

New "Cure-All" for Trees.

I want your advice about a new tree protector.

All right—it won't cost you a cent, and you may not like it after you get it.

I have discovered a new way of protecting trees from diseases—like blights or rots.

Is it a spray?

No, it is much cheaper and easier than spraying.

Do you bore a hole in the tree or put your "medicine" at the roots?

That's my business! It has cost me time and money to perfect my plan. It belongs to me just as much as a mechanical invention belongs to an inventor. I have tried it until I know it will work.

What do you want advice about?

I want to know how to sell my secret, so I can get some needed money out of it. If you will advertise it and talk about it I will pay you a commission on sales.

That is an old story—older than the hills; of course we will not do anything of the sort.

Do you mean to say that people offer such secrets for sale?

Plenty of them. During the past year at least five men have told your tale with variations. One proposed to uncover a root of the tree and stick the end in a bottle containing his "medicine". The other bored holes in the tree and put in sulphur and other substances. Another had a secret plan for making strawberries fruit at any month of the Summer. Still another wanted us to join a company for propagating a microbe, which is to be bottled and sold to farmers. When put into any old trash like weeds or straw this microbe will manufacture the finest of manure. You are not alone by any means.

Don't you believe this remedy cured my trees?

You say so—what else do we know about it?

Are you open to conviction?

Certainly—as wide as a church door.

What will convince you?

Send your remedy to half a dozen leading experiment stations and ask the workers there to test it. If they O. K. it we ask nothing more.

But they are jealous of practical men. They will either condemn it because it is not scientific, or else steal it, and I shall get nothing out of it.

Nonsense! You will be dealing with honest, honorable men. If your remedy won't stand scientific investigation it won't stand common sense. After years of patient study the scientists have given us the Bordeaux Mixture as the most reliable "cure-all" for plant diseases. It is a good remedy, but not perfect.

That's just it. They don't want a common farmer to come in with a new thing and show that he is smarter than they are.

Why do you talk in this childish way? People are tired of pumping and spraying, and would gladly welcome an easier method of treating disease. You cannot keep your process a secret anyway. You cannot have perfected a system of treatment, for you do not pretend to understand the laws of plant life. Even if you have by accident discovered some general principle of treating plant diseases, it will have to be overhauled, tested and proved before it can come into general use.

Do you pretend that the scientists at the experiment stations know everything?

Not by a good deal. They have much to learn. They haven't been able to tell us half they know so that we can understand it. It is only now and then that they can lay down fixed and definite rules for us, but they can apply the fixed and unchangeable rules of natural law to such claims as yours, and tell us whether it is worth talking about or not. Don't be so foolish as to think Nature has reached over the heads of her hardest students to give you a prize!

But do not men who never received a doctor's diploma discover remedies for human diseases?

They make pills or decoctions which overcome constipation. That is about all! Most of their patients would be "cured" if they would exercise with a buck-saw, quit eating so much fat meat and eat half a dozen apples every day. A man who values his orchard or his own organs will go for medicine to those who know why they give medicine—not those who simply know that they give it.

Ruralisms

NOTES FROM THE RURAL GROUNDS.

ORANGES FOR POT CULTURE.—The growing of orange or lemon trees from seeds is an interesting operation for the window gardener, but as time passes and they grow strong and bulky, without showing signs of fruiting, one begins to question their value from even a decorative standpoint and to consider the advisability of grafting or budding to some known fruitful variety, or discarding the subjects altogether. It is rare indeed that a seedling Citrus tree will bloom and bear fruit until it is nearly 10 years old and has reached an unwieldy size, and the fruits, when finally produced, are rarely of any value. The seedlings of cultivated oranges and lemons are even less likely to reproduce the good qualities of the parent than are our northern orchard fruits, and we all know how frequently the latter revert to useless primitive types. In the Otaheite orange, a dwarf form of the common sweet orange, Citrus Sinensis, and the kumquat, Citrus Japonica, both of comparatively recent introduction to American culture, we have two handsome and practicable plants for the window or small greenhouse. The Otaheite orange is now well known, and is extensively grown. In pot culture it makes a sturdy little bush with glossy green leaves and little bright yellow oranges, which hang on with great persistency for several months after they have colored up. They are edible but of low quality, the flavor being sweetish and insipid, though occasionally a sour or bitter fruit is met with. The culture is very simple, a fruiting plant growing well for several seasons in a five or six-inch pot. It is not unusual for little plants in two or three-inch pots to flower and mature fruits, but under ordinary window conditions such small receptacles cannot be kept sufficiently moist. A good compact soil, containing some crushed or ground bones, suits these oranges very well. For the rest they like plenty of sunlight and a moderatcly warm situation. The leaves should be kept free from dust and black fungus by frequent showerings of warm water, and scales, Mealy bugs and other insects may be readily removed by scrubbing with soapsuds in which a little kerosene oil can be incorporated. The blooms of the Otaheite orange have the true orange-flower odor, but are smaller than those of the edible varieties and generally of a pinkish color.

The kumquat is to be preferred to the Otaheite orange, in that it freely bears fruits delicious to the taste as well as pleasing in appearance. It is a native of southern China, and forms a large bush or small tree when grown on its own roots in a locality free from frost. It is extensively cultivated in Japan, and has lately been planted in considerable quantity in Florida and California. The little fruits are much prized for preserving, and are eaten fresh to a large extent. A sweet gelatinous layer is found between the sour central pulp and the thin, pleasantly-flavored rind, and forms an agreeable combination when the fruit is eaten whole. Two varieties are grown, one having round fruits and somewhat thorny branches, and the other plum-shaped fruits an inch in diameter and 1½ to two inches long. The trees bearing the oval or plum-shaped fruits are almost thornless. For pot culture kumquats are grafted on hardy orange, Citrus trifoliata, stocks which dwarf them very much and is said to render them hardier when grown in the open. Little trees less than two feet high bear as many as 100 fruits, which come to full maturity and flavor in a window or under glass, if given plenty of sunlight and a temperature sufficient to keep geraniums in a growing condition. They require about the same treatment as the dwarf orange, but those grafted or budded on hardy stocks often become quite dormant after fruiting, and can be stored in a light, frost-proof cellar until Spring if the soil about the roots is kept moderately moist. During the flowering period, in June or July, the trees should be placed outside so that bees and other insects can have acccss to the blooms and insure pollenization. If plunged in ashes or other sharp material and faithfully watered these dwarfed Citrus plants may well spend the Summer out in the sunshine, but should be taken inside before the nights turn very chilly, especially if well set with fruits. The portraits of the two Citrus fruits, shown at Figs. 1 and 4, on first and third page, are taken from specimens grown on the Rural Grounds under the most ordinary conditions. The Otaheite orange tree is 16 inches high and is established in a six-inch pot. It bore 14 perfect oranges this season. The kumquat is 22 inches high and growing in an eight-inch pot; 73 fruits were ripened. Each plant is about five years old, and has bore repeated crops. The pictures show the fruits somewhat reduced in size.

RHUBARB AND CELERY.—On December 12 we bedded five large roots of Victoria rhubarb in each of the two cellars on the Rural Grounds, placing one lot sufficiently near hot water pipes to secure a soil temperature of 55 degrees. The other lot is in an unheated cellar in which the Winter temperature rarely exceeds 40 degrees, and in which slight frost may penetrate. The clumps were loosened just before a sharp freeze, and transferred to the cellar while the ball of earth was solidly frozen, loose soil worked between them, and well-watered after thawing out. All this is in the usual method adopted by rhubarb forcers, but we wish to note the effect in earliness and amount of product of the different temperatures; all other conditions being about the same.

As noted on page 34 of the last volume, celery is grown on the Rural Grounds without banking or earthing up, except a slight handling when a severe frost seems imminent in order to protect the young growth in the center to some extent. The plants are cultivated in the usual manner, except that the soil is kept entirely level, the celery growing in as free and unrestrained a manner as cabbage or lettuce. These clumps are lifted and placed close together on the earthen floor in the coolest part of a cellar, and the soil watered whenever it shows signs of drying out, taking care not to wet the foliage. The result has always been a strong, erect and delicately-bleached growth from the center, at the expense of the reserve materials stored in the thick rootstock, that to our taste excels in quality any celery bleached by earth banking or other means available in trenches. In this last week of December we have 700 fine bunches developing in storage just as the market surplus is diminishing. Under these conditions celery will keep until March if not attacked by aphides or plant lice, and is instantly available when wanted. If aphides appear it is best used rapidly, as nothing but the use of tobacco in the form of smoke, infusion or powder will check them unless facilities for using carbon bisulphide or hydrocyanic acid gas are created. We have never been troubled with the insects until late in February, by which time the celery is chiefly a memory. No novelty is claimed for this practical method of storing celery, but we feel like calling repeated attention to its value. W. V. F.

The Rise of Ruby Queen

A. J. P. of this place informed me that his Ruby Queen rose has made the astonishing growth of over 140 feet since May. I have just called to look at the plant in his greenhouse, and after measuring one of the numerous runners myself, I am satisfied his claim is correct. This exceeds greatly any growth claimed thus far for the Ruby Queen in THE R. N.-Y. The plant is in fine growth. The grower also has several new layers of it growing. W. P.

Port Chester, N. Y.

THE R. N.-Y. is glad to publish the above remarkable growth of a Ruby Queen rose from the little plant sent out last May. We will venture the opinion, however, that few, if any, blooms will be produced on this plant as long as it is kept under glass. Rosa Wichuraiana and its immediate hybrids produce their flowers from wood of the previous year's growth after it has been checked and ripened by a lengthened period of cold weather. Dormant plants taken inside, bloom finely if of sufficient size, but glass-grown shoots have never bloomed on the Rural Grounds. The great inherent vigor of the variety is well shown by a growth of 140 feet of branches in less than eight months.

FRUIT NOTES FROM MONTANA.

There are a number of the Idaho pear trees in this State, and quite a good many came through the hard Winter two years ago, which killed off a large percentage of our pear orchards, and set back the remainder. I was plowing one day and the next morning the thermometer had dropped to 22 degrees below zero without snow. That was the starter of the damage. The pear is a good one, undoubtedly, but our standards are Bartlett, Clapp and Flemish Beauty. Perhaps Idaho will outdo them, but such is not the verdict at present, chiefly perhaps as there are not many of the trees in the State. In apples, we think we can beat the world, as we have no insect pests or fungous diseases. The orchard inspection last year, a very thorough one, only revealed three cases of Codling-moth in Montana orchards. Why the moth is not more plentiful seems curious, as the fruit inspectors found that it has been shipped into the State by the carload. We are now getting in shape to supply our home market, and have many large orchards of several hundred acres. My own, of about 1,500 trees, is considered quite small. As far as shipping east is concerned it would be quite possible to put on the market in perfect condition. In a conversation I had with the representative of the Northern Pacific Railroad a year or so ago, he told me we could never ship east of Chicago or to Europe at a profit, as we then came into competition with your big orchards, with the disadvantage of freight added. However, he said that we had an unlimited market in the country immediately east of us, in which we would have the advantage of freight distance over our great competitors, Oregon and Washington, quality also giving us an advantage over these two States, where wormy apples are strongly in evidence. It may interest you to know that Wealthy is a late Fall and Winter apple with us. H. C. B. COLVILL.

For Farm and Garden **IRON AGE** Tools Save Time and Money

Iron Age tools more than double the work you can do in a day. They do better than hand work. They save you many dollars for labor in a season. They have been tried and found honest by two generations of farmers and gardeners so that the name **Iron Age** stands for all that is best in Seed Drills, Wheel Hoes, Riding Cultivators, Potato Planters, Horse Hoes and Cultivators. Don't do another season's hard work without **Iron Age** help. One of our novelties this year for garden and truck farm work is the **No. 15 Iron Age Single Wheel Hoe, Hill and Drill Seeder,** by far the best seed drill and single wheel hoe ever made anywhere. Not a single advantage of the separate tool is lost. Places seed in hills or drills, plows, rakes, opens furrows, covers, hills, hoes and cultivates. Write to-day for free copy of the new **Iron Age Book.**

No. 15 Iron Age Combined Single Wheel Hoe, Hill and Drill Seeder.

HOPE FARM NOTES.

A HEALTHY MIND.—I seem to have made what is called "a bad break" when I sat on my old stone wall and let memory run away with me, and then told about it! People are coming from near and far to point out the evil results from such poor farming. Some of our good friends seem to think that it's like leaving weeds in your cornfield to try to give vitality to the wild oats and other misplaced plants in your past history. Others object to the use of Sunday for such stone-wall meditations. I wish I had space for some of these letters, but I will give one at least, which is a good send-off for the new year:

I have been much interested in many of your articles in the most highly appreciated paper, THE R. N.-Y., and one thought has stuck to me until I find myself attempting to answer in a perhaps broken way. Now, our friend spoke of spending a Sunday afternoon sitting on the fence contemplating. Well, I presume most farmers have had more or less experience in this line. Now, the important thing is where were our thoughts in our measure of man's ability to do great things, or did we see God mapped out in everything the eye could look upon? I believe most of us are prone to see our own works and forget the great Creator. I don't intend to accuse our friend of doing so thoughtless a thing, but wonder if he ever tried spending God's holy day in this way or something similar. For instance: Get up nearly as early on the Lord's Day, do absolutely necessary chores, having shaven and washed night before, which is only a cleanly and wholesome way for all to do. When the Madame announces breakfast and all are comfortably seated smelling of fried Chester and hot coffee, read from God's word how we should live on the Sabbath Day, instilling into the young mind holy seed and comfort to those older in years. After breakfast don the Sunday garments, all hands, old, middle-aged and young; go to church, listen to the sermon for the purpose of finding out God's will concerning farmers. What a rest to the brain that has been perplexed with drought and bugs. Of course, the children must attend Sunday school and get the benefits of it. How necessary for the children's teaching, and just let me tell you it is just the place for all, young and old, learning how the rich young ruler could not be saved for his riches, and again how Zaccheus was converted with his riches. B. BRIGGS.

It's hard to beat that plan as far as it goes, but our friend doesn't go on and tell what he would do after he got back from church. Pray don't think I sat on that stone wall thinking to crack up the great things our folks have done or expect to do. As I sat looking off over the hills that day the vast contrast between the mighty power of God and the puny force of man came home to me as never before. The men who built the stone wall and cleared the fields thought their work would endure, and perhaps they boasted of it. Just a few idle years, and their work is undone—their results wiped out by the ceaseless, fateful march of Nature. I thought that day of the idle, careless hours and days I had passed—standing still, marking time, while God and Nature marched on.

TO-MORROW.—These are good thoughts to bring up at New Year's time, but another friend gives me a gentle dig as follows:

We are heartily glad to think the practical Hope Farm man found no evil spirits among his shadowy Thanksgiving visitors. We are of the opinion that the good, hardy son of toil has little time to deal with visitors of the past, the future tense being of more importance than the past. Where he failed in the past he must amend and strive for better things.

Amen, says the Hope Farm man! I won't agree not to sit on stone walls and think about yesterday, but I won't talk much about it. I can't go back and remake yesterday, but to-day is only to-morrow's yesterday after all. Sometimes however, yesterday jumps out of the past and slaps you on the back so that you can't ignore it. Twenty years ago at this time of the year a certain young man went wandering, homeless and alone, through a farming neighborhood in a western State. He was trying to work his way through college, and had turned book agent for the time. Dogs had barked and bitten his pride into the dust; women with brooms and men with stern voices had classed him with a rogue who went through the neighborhood two weeks before. Without home, money, credit or hope this young man by chance met a school teacher, who took him home to his father's farm for the night. The old folks took that young man in, gave him a job, got back his courage and nerve, and built up hope in his heart. That young man was your humble servant, and now, 20 years after, it seems like a hand reaching out of the forgotten past when I get a letter from that school teacher. He has met with some reverses and has a boy of his own 17 years old, who wants to work *his* way through an eastern college! So you see we can't always get away from our yesterdays after all—and thank the good Lord we can't—say I.

BEST FOOT FIRST.—Hope Farm was a sort of Madameless Eden for nearly a week. A telegram came stating that Jack was sick in Massachusetts. The Madame went to see about it and it was nearly a week before Jack could be brought back. The little Bud had never been separated from her mother for more than 24 hours at a time before, but she kept looking for "to-morrow" and finally her mother's to-morrow came. That hopeful day always comes to those who work and wait for it—not to those who shirk and complain. Was the Madame glad to get back? Well, now, it was as good as a whole series of Christmas presents to see her, with her work dress on, walking about the house with the children tagging after her and the grown folks listening with every ear to the story of her trip. She had an attentive audience, I can tell you. To my mind the best thing she had to tell was the story of a dear old invalid lady. This invalid lost the use of her limbs; but instead of grieving she was thankful that her hands were free. Then disease claimed one hand entirely and crippled the other, but instead of grieving over this loss she was thankful that eyes and ears were left! Now suppose we grown-up folks started this new century with the solemn vow that we would take life that way—not grieving over losses but thankful for what is left us! But some one will stand up and say, "Why doesn't this man tell us about *farming*?" In answer to that question I will stop right now with the remark that *right living* beats any other crop you can raise on the farm.

FARM NOTES.—I am going to try some of that waste molasses from a beet-sugar factory for feeding. My idea has been to make a sort of "switchell" or molasses and water and pour it over the cut fodder. Those who have fed it say pour the thick molasses right over the grain. It will take the place of corn, and may put fat on the ribs of old Major and Franko. That's more than corn will do. . . . We finally decided to rake up leaves for bedding, and now have a fine lot on hand. They were bagged about as a reader advised last week. Why should not the forest be made to feed the farm? As between gathering leaves in the woods or getting planer shavings at $1 a load I will take the leaves. Since the ground froze up the Winter oats have failed. I doubt whether we shall see them in the Spring. I did not much expect it for the oats gave Fall pasture enough to more than pay their cost. Still it's human nature to ask for "more." . . . The more I feed pigs the surer I am that it pays to have good stock. Scrubs will do well at working over manure, but that is not the highest ambition of the hog owner. Good pork will buy more Christmas presents for the children than manure pile work will. I am satisfied that we can make pork at a good profit in New Jersey, and now I mean to go at it right. After studying the breed question as carefully as I knew how I have picked out the Berkshires as best suited to our conditions, and I have bought a registered sow which Hope Farm is prepared to brag about. This black lady has a pedigree several yards long, and hams and shoulders capable of carrying it. Say what you will about it, a pedigreed animal brings a good influence to a farm, and all the underfoot friends profit by her coming. . . The weather turned warm and wet at Christmas and the frost is rapidly coming out of the ground. Perhaps before this is printed old Jack will have put it back again, but as I write it looks as though we could plow by New Year's! This open Winter saves the coal bill at least. H. W. C.

OHIO STATE HORT. SOCIETY.

PART III.

Prof. Green brought with him from the experiment station a fine collection of over 40 varieties of apples. Among these were several samples of the true Gano, a Ben Davis upon which the stripes are dissolved and blended into a smooth, clear bright red. The quality and texture of the apple is identical with that of Ben Davis, certainly no better. The York Imperial was conspicuous in nearly every collection. It is a good apple and is growing in popularity. Fine specimens of Rome Beauty were shown by several growers. There is no question but that this variety is hard to beat in southern Ohio, and in many other places among the hills of the State. Mr. E. M. Buechly, of Greenville, O., brought with him samples of the Greenville, formerly called Downing's Winter Maiden's Blush. This is an apple I had long desired to see and taste, and was not disappointed. A Maiden's Blush in Winter is all that need be said in its praise, as that old variety has long been a standard of excellence in its season. As I write this I have before me a specimen of the Opalescent, which represents the most beautiful, brilliantly colored, plate of apples of the entire list exhibited at our meeting. It is large, deep golden yellow ground almost entirely covered with a rich, dark red, prominently dotted. The flesh is tinged with yellow and is of good quality. It is a beautiful apple with a beautiful name, and if the tree prove healthy, vigorous and productive, and the fruit of good keeping qualities, it will prove a winner for the marketmen. There was a fine display of Grimes Golden which is claiming more attention than ever on account of its great popularity among those who appreciate an apple of the highest dessert qualities. This variety, upon most markets, sells at sight, and will command a price higher by one fourth than any other Winter variety. It is claimed by some that the tree is short-lived, while others report healthy 30-year-olds that are on full duty. Well-developed samples of Lankford closely resembled York Imperial, but proved to be very different in quality and texture. The Lankford is of good flavor and is a splendid cooker. The exhibits of grapes were not extensive, and the condition rather bad. There was quite a display of pears, also an interesting one of the evaporated fruits of California. Mr. Montgomery, of Licking County, and Mr. Farnsworth, of Lucas County, made fine competitive displays of potatoes, the first premium being awarded Mr. Montgomery. Officers elected for the ensuing year are as follows: Wm. Miller, Gypsum, president; W. N. Scarff, New Carlisle, vice-president; W. W. Farnsworth, Waterville, secretary; N. Ohmer, Dayton, treasurer. F. H. BALLOU.

BABY LAUGH

It belongs to health, for a baby, to eat and sleep, to laugh and grow fat.

But fat comes first; don't ask a scrawny baby to laugh; why, even his smile is pitiful! Fat comes first.

The way to be fat is the way to be healthy. Scott's emulsion of cod-liver oil is the proper food, if he needs it; but only a little at first.

We'll send you a little to try if you like.
SCOTT & BOWNE, 409 Pearl street, New York.

"A SQUARE DEAL."

We believe that every advertisement in this paper is backed by a responsible person. But to make doubly sure we will make good any loss to paid subscribers sustained by trusting any deliberate swindler advertising in our columns, and any such swindler will be publicly exposed. We protect subscribers against rogues, but we do not guarantee to adjust trifling differences between subscribers and honest, responsible advertisers. Neither will we be responsible for the debts of honest bankrupts sanctioned by the courts. Notice of the complaint must be sent us within one month of the time of the transaction, and you must have mentioned THE RURAL NEW-YORKER when writing the advertiser.

Name and address of sender, and what the remittance is for, should appear in every letter.

Remittances may be made in money order, express order, personal check or bank draft.

THE RURAL NEW-YORKER,
409 Pearl Street, New York.

SATURDAY, JANUARY 5, 1901.

THIS COPY

of THE RURAL NEW-YORKER is sent you because we think from inquiry that you will be interested in a reliable farm paper. Please look it over. You will find it clean, well printed on good paper, illustrated and reliable. After 50 years continuous weekly publication, it is at the present time acknowledged to be the best-edited farm paper in America. Last year we distributed the new rose, Ruby Queen, to subscribers. We frequently distribute novelties originated at the Rural Grounds, but never anything that delighted subscribers as this rose did. Hence, we prepared a supply for new yearly subscribers this year. Send us $1 now, and we will send you the paper every week for a year, and this beautiful new rose free and post-paid. In two years you would not let the rose be taken out of your yard for a $5 bill. If you would, or if you are not in every way pleased with the paper, we will return your dollar. Send at once, and we will see that you get a nice rose in right time for planting. If you do not send the yearly subscription, send 10 cents in the coin slot of blank order inclosed, and we will send you the paper every week for 10 weeks. Fold and seal the three gummed edges of the blank, and mail at our risk.

*

WHAT is the use of going to Europe to study the ruins of ancient Greece, while there are millions of pounds of oleo right here in this country? A study of the quickest way of killing the fraud in oleo is of more importance in preserving a live republic than any study of the reasons for the death of an old one!

No one can tell yet what the Senate committee will do with the Grout bill. The committee voted to end the hearings on January 10. This seems favorable to the bill, for the oleo people desire to let the hearings dawdle along until this session of Congress has ended. Now is the time to give your Senators a New Year's present of your written opinion on this oleo matter. Churn out the words and send them right along.

*

THE Superior Court at Hartford, Conn., recently had occasion to decide whether frogs are fish, within the meaning of a statute forbidding the catching of fish in a public reservoir, and reaches the opinion that they are. This recalls the astounding information received by an English traveler, who wished to know whether the rule against admitting dogs would prevent him from taking a turtle into a passenger car. The railway porter appealed to passed the turtle with this decision: "Cats is dogs, and rabbits is dogs, but a tortoise is an insect!"

*

ONE of our readers says that he attended the meeting of the Ohio State Horticultural Society. He says he ought to have joined this Society years ago. While his own operations are comparatively small he can see where he would have been several hundred dollars better off if he had attended more of the meetings. That is what we hear people say of other meetings, and there is no doubt that a live man will get rid of a good many dead ideas at any of our State meetings. Of course, as we say, the man must be alive, and both willing and ready to absorb information. We might take a trunk or a fertilizer sack to such a meeting and leave it open. When we took it home we might find some waste papers and refuse in it, but that would be about all. Some men complain that they cannot learn anything at such meetings, but the trouble usually is that they do not go there in a teachable spirit, but rather with the idea of proving that no one can teach them. We do not call such people live men, for they have ceased to grow! We regret that our farmers' gatherings do not attract hundreds where they now bring together dozens.

*

DENMARK, the great butter-making country of the world, bought last year 35,000,000 pounds of oleo oil from the United States. Last year England bought nearly $40,000,000 worth of butter from Denmark, but the frugal Dane spreads oleo on his own bread. Oleo costs him 15 cents a pound, while England pays 40 cents a pound for his best butter. It will be seen that the Dane does not pay butter prices for his oleo.

*

MOST people find it necessary to eat crow now and then, and there is a knack in knowing how to do it gracefully. Few of us have acquired the art of facing the defeat of a pet plan, without showing bitterness or putting on a flippant don't-care air, which every one knows is not real. A man who, when defeated does not try to conceal the fact that he is sorry, and yet shows that he does not intend to look cross-eyed at the world for the rest of his life, or turn himself into a hedgehog or barrel of vinegar on this account ought to be respected, and usually is—but he is a rare bird.

*

THE R. N.-Y. is a "boxer". We make no secret of our plan to put on the gloves and make a hard fight for the box as an apple package. The barrel is satisfactory for a good share of the trade, but the neat box well packed with high-grade apples will find favor with thousands of city people. The apple trade will be increased by its use. You say the commission men do not want to handle the boxes? Well now, we have had an old-fashioned idea that the fruit grower was working for the interests of his own family, and not for commission men. We thought these gentlemen were working for those who pay them. THE R. N.-Y. is a "boxer". We shall make a fight for the apple box!

*

PROF. Phelps, in his articles on feeding nitrogen to fodder crops, has given farmers a valuable new idea. We may not be able to feed fat into milk, but it is evident that we can increase the amount of protein in our hay by applying soluble nitrogen at the right time. Naturally it follows that the hay to sell is that grown on the poorer fields, and the hay to feed at home is that grown where an abundance of nitrogen is used. This shows the great value of nitrate of soda as a source of nitrogen. It is available at once, and can be applied quickly and easily at almost any stage of the plant's growth. Good farmers have always claimed that it pays to feed the grass crop well. Here we have new evidence of it.

*

WE hope to make the coming year a notable one in certain editorial features of THE R. N.-Y. Mr. J. H. Hale gives us this week the first of a series of articles on "essential principles" of crop production. Our plan is to secure the solid, boiled-down experience of men who have made a life study of some particular crop, and who have mastered it so far as such mastery is given to human thought and energy. These articles will not be filled with dry details, but will deal with essential principles—that is, the points which these strong and successful men have found most important. They will cover all departments of farm operations, and will, we believe, form the strongest collection of horticultural and agricultural articles ever printed by a farm paper.

*

IT is claimed that French chemists have succeeded in separating the gases of which the air is composed, so that the oxygen may be ignited for use as light or fuel. For years efforts have been made to separate and capture the nitrogen in the air, so that it might be used as a fertilizer, but the leguminous plants seem to possess a trade secret regarding the process, which they will not give up. If, by means of some simple apparatus, the oxygen of the air could be separated to be used as fuel we should have an industrial revolution far greater in its results than the introduction of steam or electricity. Coal and oil are now the chief sources of fuel. Steam power is dependent on them, and therefore power or force is concentrated, for it must be tied to the places where fuel is cheaply handled. These places are usually at the seaboard, or on some inland watercourse where competitive freight rates are possible. The effect of using oxygen from the air as fuel would be to scatter the Nation's industries and draw many of them away from the great cities. This we believe would be a desirable thing for farmers. On the other hand, such use of oxygen would be a severe blow to our manufacturers. We are coming to have more and more of a monopoly of coal and oil, and to this extent have an advantage over other nations. With the air providing abundant fuel our manufacturers would lose this advantage.

*

"YOU color your butter; why then is it a fraud to color oleo?" That is the question which the oleo men ask. They have been driven from every other position, and they consider this unanswerable. Let us see about that. Butter is not colored in imitation of some other more expensive product. For centuries butter has been recognized as a yellow substance, and no one is deceived when pure butter fats are uniformly colored. It is not so of oleo. This is a collection of cheap fats costing less than 10 cents a pound. The color is put in so that the manufacturers may sell it at 20 cents or more. In one case the color is used to give a uniform tint to a recognized article of commerce. In the other case it is used to prepare a counterfeit so that cheap fats may be sold for twice their true value. The whole fight of the oleo people is waged for the privilege of counterfeiting an article which has carried a definite color brand for centuries.

*

FROM all over the country come reports to the effect that plain farmers are taking more interest than ever in the various farmers' organizations. In some States there have been vigorous efforts to elect new sets of officers in place of the men who for years have "run things". As a rule, such efforts to procure "a new broom" fail through a lack of organization. In some cases the movement is doomed to failure because ill-advised and based largely on jealousy or personal spite. We are glad, however, to note that farmers begin to realize what they might accomplish if they would use their power wisely and well. There are advantages in having a few able men conduct the affairs of these societies. Often such men do the work at a loss of time and money. Farmers may well come forward and help such men rather than attempt to throw them out. In other cases the management falls into the hands of a "ring" of strong, selfish men who run things for their own benefit. Such men may well be dismissed without ceremony. The point we wish to emphasize is that a few strong, courageous men in an association of this sort can, if they try, secure a solid backing that will enforce reforms. A great majority of the people in this land want something bet ter. They often stand still, marking time—waiting for a strong leader to suggest and lead.

*

BREVITIES.

We hit you hard, Ben Davis,
But you stood up to the craek,
And every time we hit you
You would fire some figures back.
You came and shook the money
That the people pay for you
Beneath our very noses,
And there's nothing left to do.
For money talks, Ben Davis,
As it has since Adam's day;
When your forbears broke Eden
And we'll let you break away.
For your downfall is coming;
We will give you rope enough,
When all your trees are bearing
You will find the sledding rough.
We like your bluff, Ben Davis,
There is money in your cheek,
But when we're asked to plant you—
No I thank you—not this week.

DON'T put young blood into old ruts.

THE greatest *verb* al contract is I'll *try*!

Too many henhouses are cold-storage plants.

STINGETH like an adder—the fellow who foots up your tax bill.

FROST makes some folks hug the stove, while others go and make a move.

THE Crimson clover and oats gave good pasture on Christmas Day.

HORSE sense in the care of the horse will mean horse dollars to the owner.

REMEMBER that the nervous cow gives up her food, while the beefer stores it up.

THE greatest present you will ever have is the opportunity of improving the present.

NO, SIR, you can't overcome the bad blood in a scrub by crossing it with the corn crib.

YES, drought is a blessing if it prove the last straw in forcing the dairymen to build a silo.

A RARE man—he who admits that it is easier to do a thing well than it is to tell about it.

COVER crops are popular now—Grandmother is showing the little girls how to raise a bed quilt.

IN bad designs falter—in good ones make haste, and may the New Year be trimmed up to your taste.

GREATER is he that biteth his tongue over the first word than he that smacketh his chops over the last one.

IT pays to thin overloaded fruit on peach, apple or pear trees. How about strawberries on big plants in hill culture?

HOW about a duty on hides? Well, it is certainly your duty to hide your sorrows, and not make free with them to everybody.

THOSE Pennsylvania milk farmers know how. They held together for the benefit of those who had only a verbal contract—and won.

Events of the Week.

DOMESTIC.—A fire in a cocoanut-shredding factory at Philadelphia, Pa., December 19, caused a loss amounting to $200,000. . . . Attorney-General Griggs argues before the Supreme Court that the Constitution does not follow the flag into Porto Rico and the Philippines. . . . The 15-year-old son of Edward Cudahy, the Omaha millionaire, was kidnapped December 19, and released later on the payment of $25,000 ransom. . . . An explosion of natural gas at Beaver Falls, Pa., December 20, seriously injured seven persons, two fatally. . . . In a four-cornered shooting affair at Sopchoppy, Fla., December 21, State Senator Rouse and Edgar Nims were killed and W. F. Edwards and Frank Walker were badly wounded. . . . . Each of the 3,000 employees of the Crane Company, of Chicago, Ill., received as a Christmas present an amount equal to five per cent of his year's earnings, the aggregate reaching $100,000. . . . At Vancouver, B. C., the breaking of the Lula Island dykes has caused further damage to the sea walls protecting the farmers of the Fraser River Valley. Owing to high tides, strong winds and heavy rains, the lands have been badly flooded, and the village of Steveston is under three feet of water. Wooden sidewalks are floating away and the only means of locomotion is by boats. Wesham Island is badly flooded and ranch owners have been removing their live stock from the submerged fields in freight boats. . . . The Western Union Telegraph Company has been defeated in its suit against the National Bell Telephone Company for $12,000,000 royalties. . . . Greenup Co., Ky., is quarantined in consequence of an outbreak of smallpox. The disease appears unusually prevalent in many parts of the United States. In New York City, new cases continue to develop. . . . Counsel for the Saloon Keepers' Union, of Buffalo, N. Y., have drawn up a bill for introduction during the next session of the State Legislature, providing that saloons in that city may be kept open all night during the Pan-American Exposition. . . . An Indian outbreak is feared at Sitka, Alaska. The situation is serious, as there are far more Indians than whites. . . . The steamer Alpha was wrecked near Union Bay, B. C., December 18, during a terrific gale; nine lives lost. . . . A private bank at Hope, Ind., was entered by burglars December 18, and $15,000 stolen. . . . A race war was in progress December 25 at Cementville, Ind., armed negroes being practically in possession of the town.

CONGRESS.—December 20 the Hay-Pauncefote treaty was ratified by the Senate, with a vote of 55 to 18. The Davis amendment and the Foraker amendment superseding the Clayton-Bulwer treaty were retained, but all other amendments were voted down. Both branches of Congress adjourned until January 3. An effort will be made in the House when the River and Harbor bill is under consideration to tack on to it provisions for extensive storage reservoirs in the West. The River and Harbor Committee has been pursued all the session by western Congressmen who want to get appropriations for this purpose. The committee has steadfastly refused. The storage reservoirs are ostensibly sought for the purpose of improving waterways, but the indirect object is to get vast supplies of water for irrigation schemes. The committee is unwilling to mix river and harbor improvements with the irrigation question.

GENERAL FOREIGN NEWS.—Officials of the American asphalt trust have appealed for warships to protect their interests in Venezuela. President Castro has annulled the asphalt concession, and revolutionists are threatening property. . . . London cablegrams state that disloyal Dutch in Cape Colony are joining the Boer invaders. Fifteen hundred of the native Afrikanders have united with the burghers at one point. Lord Kitchener is on the ground, and his forces have repulsed some of the Boer attacks. The British forces have reoccupied Britstown, recently captured by the Boers. . . . At a meeting of the foreign ministers in Pekin, December 20, everything in regard to the terms of the joint note was agreed to including the British modifications. Through a blunder in the transmission of Secretary Hay's cabled message of instructions to Minister Conger, and to an error in translation of the cipher, Mr. Conger has been voting on the negotiations in direct reverse of the American policy. The latest advices from Pekin state that the joint note embodying the demands of the Envoys on China has been forwarded for acceptance to the Imperial Court, and the indications are that the ultimatum will be agreed to by the Emperor.

FARM AND GARDEN.—The Peninsula Horticultural Society will meet at Middletown, Del., January 9-11.

Breeders of Blue Andalusian fowls are about to organize a club. The annual dues will be small. A meeting for organization the following will serve as officers: E. L. C. Morse, Chicago, Ill., president pro tem.; Newton Cosh, London, Canada, vice-president pro tem.; R. W. Lovett, Boston, Mass., secretary pro tem.

Frank Rockefeller is said to be about to purchase 140,000 acres of land in Kiowa and Clark counties, Kan., upon which to raise purebred stock.

At the eleventh annual meeting of the Missouri Dairymen's Association, at Kansas City, the following officers were reëlected: Norman J. Colman, St. Louis, president; H. C. Goodrich, Calhoun, Mo., first vice-president; John Patterson, Kirksville, Mo., second vice-president; J. J. Smith, Sweet Springs, Mo., third vice-president; G. A. Umstott, Mirabile, Mo., fourth vice-president; J. L. Erwin, Steedman, Mo., treasurer; Levi Chubbuck, St. Louis, secretary. The Association is working to get a bill through the Legislature creating the office of dairy commissioner and establishing a dairy department at the State agricultural college. An expert dairyman must be selected for commissioner and he will in all probability be a man recommended by the Missouri Dairymen's Association. Practical dairymen showed a strong interest in the meeting, and displayed a decided disposition to control its management. They urge Missouri Senators to support the Grout bill.

The Minnesota State Agricultural Society will meet at St. Paul, Minn., January 8-10; E. W. Randall, Hamline, secretary. The Minnesota State Fair Association and the Minnesota Live Stock Breeders' Association will also meet at the same time and place.

A. H. Pierce, known as Shanghai Pierce, the wealthiest cattle man in Texas, died at his home, Pierce Junction, recently. He owned enormous ranches, and was also chief owner of the Gulf and Interstate Railway, which was swept out of existence by the great tornado last September.

The Vermont State Merino Breeders' Association will meet at Middlebury, Vt., January 23, 1901; secretary, L. A. Kiff, Middlebury, Vt.

The Western Ontario Dairymen's Association will meet at London, Ont., January 15-18, 1901; secretary, George Hately, Brantford, Ont.

The Provincial Farmers' Association will meet at Kentville, Nova Scotia, January 30-February 1, 1901; secretary, Chas. R. B. Bryan, Durham, Nova Scotia.

The New Jersey State Fruit and Vegetable Packers' Association will meet at Camden, N. J., January 16, 1901.

The Illinois State Dairymen's Association will meet at Aurora, Ill., January 8-10, 1901; secretary, Geo. Cover, 188 South Water street, Chicago, Ill.

Francis X. Govers, representing the Standard Butter Co., of Owego, N. Y., spoke briefly at the New York Dairymen's Association on the manufacture and utility of liquid air for refrigerator purposes. He expected to give an exhibition of the properties of liquid air and the uses to which it is adapted, but because of an accident to his apparatus, he was unable to do so.

The Rosendale Creamery at Adams, N. Y., managed by R. H. Bent, had an attractive exhibit at the Watertown exhibition hall. This creamery, it was said, receives 25,000 pounds of milk each day, and supplies two-thirds of the butter consumed by the guests at the various hotels at the Thousand Islands. Its exhibit of butter was put up in neat packages weighing all the way from one pound packages to tubs of 60 pounds. This creamery is open every day in the year.

New York City Milk Supply.

Agricultural Commissioner Wieting gives the following figures to show the vast quantity of milk bought annually by New York City. The figures given represent the number of 40-quart cans:

1888	6,062,216
1889	6,630,278
1890	8,141,983
1891	8,269,953
1892	9,084,781
1893	9,303,315
1894	9,485,018
1895	9,336,827
1896	10,079,417
1897	10,338,356
1898	12,382,106
1899	13,121,655
1900	13,504,610

Thus in 1900 there were sent 540,184,400 quarts of milk. It will be seen that the supply has doubled since 1888. Mr. Welting says that whatever the cause may be for this great increase of milk for consumption, the fact remains that the enforcement of the law, the decrease in adulteration of milk and the increase in consumption have gone on hand in hand since the beginning of the enforcement of the milk statutes.

In spite of this immense flood of milk annually carried to this great city it is possible to increase the trade. As we have often stated, most people regard milk as a luxury or drink. Let them be taught to understand that it is a food to be eaten, and there will be a vast increase in its use. The future development of the milk trade is based on the proper education of the people in food values.

A Milk War in Pennsylvania.

One of our readers at Hopbottom, Pa., sends us an account of a strange milk war at that place. It seems that the Scranton Dairy Company sent agents to Hopbottom to contract for the milk, with 83 farmers. They paid a better price than these farmers were then receiving, and they purposed to ship the milk over the D., L. & W. R. R. to La Plume, Pa. Early in December the farmers were notified that the railroad company would not carry milk for the Scranton Dairy Company. The farmers having contracts with the dairy company took the ground that this was not their business, as it was a matter between the railroad and the dairy company. They continued to take their milk to the railroad station, but the railroad would not carry it. Finally the dairy company sent an agent to talk with the farmers about it. He said that as the railroad company would not carry the milk, the dairy company could not buy it. The farmers said that it was not their business to attend to the shipping, as they had lived up to their agreement in delivering the milk. Finally, the farmers hired a lawyer to attend to their interests. The dairy company then found that they could not get away from their contracts, so they agreed to take the milk from 17 farmers who had written contracts, but not from those who had a verbal promise. To the credit of those farmers be it said, that they agreed to stand together and compel the dairy company to fill both written and verbal contracts. Suits were brought resulting in judgments against the dairy company for parties who did not have written contracts. It is claimed that the milk combine of New York City is responsible for this trouble. They are said to have told the D., L. & W. R. R. Company that they must not carry milk to the Scranton Dairy Company, and that if they did, the milk-shipping business would be taken away from them. The idea is that the milk trust desires to keep control of all milk, and so manipulate matters as to have it shipped to New York, thus creating a surplus and reducing the price of milk. If it were sent to Scranton or other places, it would relieve the New York market, and that is just what the trust does not want done. We shall have more facts about this business before long, but farmers may well give thought to the results that will follow by being at the mercy of one trust which can bring such a pull to bear upon another trust.

EXPORT APPLES.—The export trade in apples is reported good by most exporters. There will be a demand through the Winter for hard firm fruit, much of which has been already bought up. A large supply of good fruit was held back during the Fall, and if this is now handled carefully and not crowded upon the market too fast, there will be fair prices and good profit in the trade. The reports given by THE R. N.-Y. last Fall came apparently just in time to be of service to the better class of apple growers. Many of them were on the point of selling at a low figure, as the buyers had almost convinced them that the crop throughout the country was larger than usual. THE R. N.-Y.'s report stiffened their courage, and they either held, or demanded a better price.

Fine Apples in Boxes.

We hope that the days of the barrel as a package for fine apples will soon be numbered. The box, such as is used for California apples, is superior in many ways. There are many city people who cannot keep a barrel of apples. They live in flats where there is no storage room. The result is that they do not buy half the fruit that they would like to use. Could they buy boxes of fine fruit the chances are that they would never be without apples. It is a matter of size of package entirely. We give below some notes from commission men. THE R. N.-Y. will keep at this matter until the box is recognized.

Our experience has been that barrels are small enough packages to handle apples in. On this market it is as easy for us to handle barrels as it would be boxes, therefore we do not feel that boxes would be any advantage to us. When apples are very high we might use boxes, but we can usually sell barrels as well as boxes.

Milwaukee, Wis. E. R. GODFREY & SONS CO.

It is our opinion after a good many years' experience that our customers do not care particularly about the kind or style of package apples are put up in, nearly as much as they do about the quality of the apples contained in the package. We think the barrel is all right as a package. The people are used to it, and there is no complaint in regard to its being too large, but there is an endless number of complaints regarding the quality of the fruit, the majority of which is packed in such a manner that the face of the barrel does not represent the bulk of the fruit below the face. Our farmers are altogether too anxious to pack up everything that grows in the orchard and sell it as No. 1 fruit. We need a new style of farmer a great deal more than a new style of apple package. POTTER & WILLIAMS.

Buffalo, N. Y.

While we favor the packing of apples in boxes, especially those of the fancy brand, it would take some time to educate the people here to use them in that style of package. We think the country trade will take them quicker than the home trade, and in time all would get educated to use them. F. ANKENBAUER & SONS.

Cincinnati, O.

Cheap Dairy Cows in New York State.

A few weeks ago a correspondent in Chemung County, N. Y., spoke of the low price at which dairy cows were being sold. He stated that fodder was scarce and feed high, so that farmers felt obliged to dispose of their surplus stock. Since this article appeared we have been overrun with communications from people who want to buy these cows. There seems to be some misunderstanding about the quality of the animals and the price. The following reports from cow districts in this section are fair, and will give a good idea of the class of stock that is offered. It must not be thought that farmers are selling their best cows at a low figure. That would be nonsense at this time, when butter is bringing a good price. The cows that are sold are mostly culls, probably the poorest in the herd—what we would call the robber cows. Some years ago certain writers made the statement that the best way to engage in the poultry business was to come to the live poultry market in New York City, and buy hens and pullets at live-weight prices, picking them out by color and shape. In order to satisfy ourselves, we bought over 200 of such birds, selecting them as well as we knew how with an eye to the so-called "egg type." The result was that we stocked up with a flock of scrubs, well-covered with vermin, alive with roup, and of little value as layers. We found that no man in his right mind ever sends his best birds to the New York market for sale. In buying this kind of stock one obtains only the culls or robber stock, which some one else wants to get rid of. Those who expect to go to the dairy districts of New York State and buy cows at $20 apiece will probably find in the end that they have purchased the culls or thieves out of some other man's herd.

The cows are all picked up in this locality. The severe drought last season made the price low, but the price of milk here is better than a year ago. O. T. C.

Wellsburg, N. Y.

I do not know of many cows being sold; think they would bring from $20 to $25 apiece. We are so near the railroad that we have a good market for milk; in Buffalo especially, the Pan-American Exposition will make a big demand. Hay is quite scarce, and early in Fall cows have sold in some places as low as $15. A. T. G.

Dayton, N. Y.

There are no good cows here for sale, only at high prices. Old cows are being picked up and driven to Buffalo. I think there is fodder enough here to winter all the stock; a great deal of corn fodder is raised here, and good many silos built in the last two years.

Delevan, N. Y. C. S. P.

SAN JOSE SCALE.—Commissioner Wieting, of New York State, reports that he has issued 893 certificates of inspection to nurserymen, covering 6,026 acres of nursery stock and 901 acres of vineyard, from which wood for propagation is taken; that he granted 425 duplicate certificates to be filed in other States and counties as required by their laws to holders of original certificates; that in addition to the foregoing his agents have inspected 3,065½ acres of orchards and 1,663 acres of vineyards where no certificate was required. This inspection covered 872,720 orchard fruit trees, of which about two-thirds are of bearing age, and all the 1,662 acres of vineyard are of bearing age.

THE CABBAGE CROP.—Readers are beginning to inquire about cabbage. How much of last year's crop was stored for Winter and Spring use? In some sections the late Fall with continued warm weather, caused much of the cabbage to rot or burst, and more than usual was sold at that time. In the large cabbage-growing districts of New York State about half the crop is reported in storage. This is true of the cabbage district to the south of Syracuse, from which large quantities of cabbage are annually shipped. Around Elmira and through Chemung County generally it is reported that no cabbage is left. December just about cleared out the stock. Trade in cabbage has been better than usual. One grower writes that he is buying cabbage from Ontario County, N. Y., at from $9 to $12 per ton, f. o. b. From what we can learn therefore the total amount of stored cabbage is smaller than usual at this time. The open Winter may force some farmers to throw their crop on the market earlier in the Winter than usual.

Woman and Home

From Day to Day.

If no kindly thought or word
We can give, some soul to bless;
If our hands, from hour to hour,
Do no deeds of gentleness:
If to lone and weary ones
We no comfort will impart—
Tho' 'tis Summer in the sky,
Yet 'tis Winter in the heart!

If we strive to lift the gloom
From a dark and burdened life;
If we seek to lull the storm
Of our fallen brother's strife:
If we bid all hate and scorn
From the spirit to depart—
Tho 'tis Winter in the sky,
Yet 'tis Summer in the heart!

—The Golden Penny.

*

ONE of our friends blames a sudden and severe attack of gout in one toe to the persistent use of orange phosphate and other acid drinks during the Summer. She got rid of the trouble by careful dieting, but says that she still feels the need of avoiding acid foods. She quoted the case of one friend who cannot eat oranges persistently without experiencing rheumatic twinges.

*

CANADA certainly sets a good example for this side of the line in the sanctity of the marriage relation. According to recent statistics, during the past 32 years only 271 divorces have been granted throughout the entire Dominion. In Prince Edward Island, with a population of 100,000, there has not been one divorce in 30 years. Evidently the Canadian enters upon marriage as a permanent relation, not a mere civil contract to be dissolved at the caprice of those entering upon it.

*

WE recently ate of a very prettily-served Winter salad, which gave an idea to be used in several forms. Turnip cups were formed by peeling small white turnips and scooping them out into cup form, then boiling in salted water. These were placed upon a bed of water cress, and filled with potato salad, to which boiled beets, cut into small strips, may be added for a garnish. Plain French dressing was served with it. Macedoine salad, which consists of various cold boiled vegetables, such as beets, carrots, peas, string beans and asparagus, cut up and served with mayonnaise, may be put in the turnip cups very suitably.

*

THE Youth's Companion tells of a man who, on his return from a two-days' visit to his brother, thus harrowed his wife's feelings by describing a family misadventure:

"It was at the dinner-table last night," said Mr. Marvin, solemnly, "that this occurred. We were all quietly eating, when suddenly little Mary gave a cry of distress, and closed her eyes. Almost at the same instant my sister-in-law pressed her hand to her forehead, and tears streamed down her face. As I gazed at her in alarm my brother Edward threw up his arms with an exclamation of intense and sudden pain, and then buried his face, over which a spasm was passing, in his napkin."

"Poisoned!" gasped Mrs. Marvin, with hysterical symptoms.

"No, my dear," said Mr. Marvin, with maddening calmness, "it was horseradish."

*

THERE is an old woman in one of the New York market districts who is known as "the quince woman." She sells quince in all sorts of forms, and is said to know more about this fruit than anyone else about the markets. She sells raw quinces, quince preserves, quince butter, quince jelly, quince jam, and quince pasta, the latter being a specialty. It is made by boiling down quince pulp with sugar until, upon cooling, it becomes a solid like damson cheese, and the old "quince woman" has standing orders for this, from a number of customers. She has the knack of altering the color of her wares by differences in cooking, and makes jelly varying from a pale delicate pink to deep red. Many city dwellers are glad to buy these homemade quince preparations, as it is quite troublesome to prepare the fruit.

*

WE have given up New Year's resolutions—we keep on making—and breaking

3666 Blouse Waist.
32 to 40 in bust.

—good resolutions 12 months in the year—but if we began 1901 with the idea of some special and extra determination, it would be against needless worry. We read recently of a woman who, on being reproached for this habit, asserted that no one need tell her that worry didn't do any good, because the things she worried about never happened. That view of the utility of worriment never struck us before. The strongest argument against worry is its deteriorating effect upon mind, character and disposition. A great and crushing sorrow, nobly borne, often elevates and purifies a commonplace character, but endless worry—"fretchedness," as old-country people say—because it rains, or because it doesn't, or because the cake is "sad," or the boys track mud into the house, makes the worrier a misery to herself and to others, and, if bodily ills be added to such a disposition, there is every requisite for lingering illness of a nervous type. Resolute cheerfulness and a determination to see the bright side are the foundation of all personal happiness; it is always possible to get some joy out of life if one puts joy into it.

The Rural Patterns.

An easy and comfortable blouse, more dressy in effect than an ordinary shirt waist, is shown in No. 3666. The model is made of Venetian flannel in hunter's green, with vest and stock of white satin-faced broadcloth, machine stitched and revers of velvet matching the flannel. Down each front, below the revers, are small buttonholes through which the gold chain links are slipped that hold the fronts in place. Countless combinations and a variety of materials can be substituted, however, and tiny silk cord and gold buttons can take the place of the links if desired, or these can be entirely omitted and the fronts hooked invisibly into place. Henrietta, plain and embroidered cashmere, drap d'été, French flannel and taffeta are all suitable and the color of both waist and vest can be changed to anything the wearer may prefer. The foundation for the blouse is a fitted lining with single darts and which closes at the center front. On it are arranged the fronts, vest and back. The fronts are smooth and without fullness at the shoulders, and are drawn in at the waist line. The vest is attached permanently to the right side of the lining and hooks over on to the left beneath the left front. The stock collar is joined to the vest and closes invisibly at the center back. The bishop sleeves are not over full, and are finished at the wrists with straight cuffs. To make this blouse for a woman of medium size 2¾ yards of material 21 inches wide, three yards 27 inches wide, or 1¾ yard 44 inches wide, will be required, with ⅝ yard 50 inches wide, or ¾ yard 21 inches wide, for vest and stock collar. The pattern No. 3666 is cut in sizes for a 32, 34, 36, 38 and 40-inch bust measure, price 10 cents from this office.

The Russian blouse also illustrated is now a very fashionable shape. The model is made from the new vicuna waist cloth in Russian blue with piping of black taffeta, stitching in black silk, and cut steel buttons, but flannel, cashmere, taffeta and all the familiar waist materials are equally appropriate. As shown the waist is cut pointed edge, that renders it peculiarly smart, but the points can be omitted and the edge left plain, as shown in the small cut, if desired. The foundation for the waist is a fitted lining with single darts in fronts and center seam in back only. The back proper is seamless, fits smoothly across the shoulders, the slight fullness being drawn down at the waist line. The fronts are simply gathered in slight fullness at the neck and gathered in at the waist, where they blouse slightly over the stylishly curved belt. The sleeves are in bishop style with pointed cuff bands that hook over invisibly. The neck is finished with high stock collar

3680 Russian Waist.
32 to 40 in. bust.

having a pointed end. To cut this waist for a woman of medium size 3¼ yards of material 21 inches wide, three yards 27 inches wide, or two yards 44 inches wide, will be required. The pattern No. 3680 is cut in sizes for a 32, 34, 36, 38 and 40-inch bust measure; price 10 cents from this office.

Pioneer Experiences; Retrospection.

The pioneers of 50 and 60 years ago, those who are now living, seem to find great pleasure in recalling the past. The work of these enduring spirits opened the way for churches, schools and other desirable and important helps to society. In these changes many things have been gained, and something lost, both in the social and material world. As accessible markets have been opened near their homes, some of the open-handed generosity of the old time has been changed to a more careful attention to the yearly revenue; the great army of tramps, the recent annoyance of farm life, has taught the people to discriminate in their gifts, a useful lesson to learn, too. Some have indulged in a morbid desire to own all the lands adjoining them. The foot peddler who carried his stock tied up in a couple of bandanna handkerchiefs, is no longer entertained free of cost over night, that the family might look over his supply of needles, pins and thread and other necessaries, buying carefully of him what they needed. His successor, who now carries a pack on his back nearly as large as himself, has been almost displaced by local merchants in the nearest town. The free, off-hand speech of casual acquaintances who saw in each other warm friends has changed to more conventional greetings.

Cultivation has done much to improve the face of the country, as well as to increase the fortunes of the tillers of the soil. The rolling prairie and adjacent woodland is as beautiful as ever to the practical eye, perhaps more so, but the lovely wild flowers have disappeared. The cattle who have grazed over the pastures, together with the plow and drag, have left hardly a vestige of the flowers which once seemed to carpet the fields. The Painted-cup, or Squaw pink, the dainty blue Fringed gentian, the Cardinal flower, the harebell, more correctly named by the children Indian's hair; of these scarce anything remains but a sweet memory, and the lady's slipper and ironweed have given place to the weeds of scientific farming, such as burdocks, purslane, pigweeds and other unwelcome comers, against which the present owners have declared war; and fields of corn, oats, Timothy and clover now challenge the admiration of all lovers of the useful and beautiful.

AUNT RACHEL.

A SUBSTITUTE FOR GRAPE JUICE.—To those readers who cannot easily procure grapes I would suggest that they try crab apples or any other sour fruit to make a palatable Summer drink. Prepare the same as unfermented grape juice, after first removing blow, seeds and stem. Lemon may be added if desired. One lemon will season four gallons of juice. I cook the lemon with fruit before squeezing out the juice. The plain apple is very nice, and much unlike the common cider in flavor.

Dressmaking as a Business.

There is no other vocation turned to so readily as sewing by young women who are anxious to become self-supporting, and it is the speediest pathway open to women bereft of husband, father or brother. But before one is qualified an imperative term of study, observation and practice is necessary. Artistic dressmaking is taught in the Drexel Institute, Philadelphia; the Armour Institute, Chicago; Pratt Institute, Brooklyn, and in similar institutes of the same class in cities. Artistic dressmaking is not taught in any of the public schools, but is deserving of a place alongside of other accomplishments. Plain sewing is taught in many industrial schools and the advance step will be taken in the near future. In the regular dressmaking schools many dress systems, as well as ordinary dressmaking, are taught. For $4 or $5 a week, lessons are given in dressmaking and designing, and the pupil is taught how to make up the material in vogue. The pupil furnishes the material, etc., and, of course, keeps the garment when it is finished. Many dressmakers from the country and villages avail themselves of such lessons during the dull season.

A woman needs a firm stock of health if she is to be a successful dressmaker. She may have late hours and long ones during the busy season, and must encounter all sorts of weather, stand in crowded street cars or tarry upon the damp street. To be a city dressmaker or under hand for shop work she will do well to have a specialty if she wishes to avoid unexpected tasks. There are advantages in being identified with a certain line of the work. The young woman does well to have an all-round training in a country or private dressmaker's shop before she comes to the city. She should not come without a little money, or people in the background ready to help her. Wages are small; board, lodging and transportation are the essentials. To be a successful city dressmaker one must be unusually clever and thoroughly endowed with the principles of her trade. The next step, and a very important one, is employment. The parlor shop, the down-town shop and the large stores are the establishments open to her. The factory and the sewing in families are also in reach. As a beginner in an establishment the novice is given only overcasting seams, putting on bindings, etc., and paid an average of $3 per week, and this rate will at least hold on for a month or two. In well-regulated shops and large establishments the same garment goes through several hands. The cutter of skirts, who usually works 10 hours a day, receives from $10 to $18 a week for her services; the skirt hands, who completely make the skirt, get $6 a week; the waist finisher from $9 to $12 a week, but she must do fine work, and is expected to finish three waists a week with the aid of a helper who puts on hooks and eyes, belts, etc. The fitter has to be very skillful, a real artist in her line, to command the place and the highest wages, $20 to $35 per week, but she is expected to be infallible, to do the impossible; that is, please the captious, make a sorry figure look at least presentable, and a good one nothing short of perfection. The forewoman oversees all things, and if not the proprietress, gets from $12 to $20 a week. This is a distinct picture of a fashionable dressmaker's shop. In large stores much the same discipline is observed in the dressmaking department, except a large force of women are kept at work refitting, altering or making over garments purchased. The wages, however, are much the same, but the work is harder; more precarious because of the rush and hurry-up admonition. Factory work is open from six to nine months in the year. This work is chiefly on shirt waists and underclothing. The hours are regulated and the rapid worker earns from $5 to $10 a week.

The best and easiest place is the private dressmaker's parlor shop. She is bound to understand thoroughly all branches of the business, and be able to expound the latest styles and fashions, and to construct everything, from a shirt waist to a ball dress or wedding gown. If she is possessed of taste and quickness she is sure of abundant patronage. There are no dull seasons for her. A good dressmaker is almost as truly trusted and as near the family as the doctor or minister. No business is more exacting, and every woman who intends to sew for a living will find the opportunities not very alluring at first, but the only safe and sure method of ascertaining whether or not one may succeed at dressmaking is comprised in a single word—try! If what I have written, gathered from an experience of 20 years as a dressmaker, will enable the readers of THE R. N.-Y. to gain a foresight of the requirements, doubtless many who contemplate leaving the farm and village for service in the city shop or factory will meet with greater success by reason of being forewarned and sufficiently prepared. ALICE M. LONG.

Rural Recipes.

'Twas not framed in gold or silver,
Yet it rather took my eye—
A very small boy on a big doorstep
With half a pumpkin pie.
—Chicago Record.

Mincemeat Balls.—Chop any left-over meat in an Enterprise food chopper, and to two cupfuls of the chopped meat add one tart apple; chop again, and then add one saltspoonful of salt, half as much pepper, one cupful fine bread crumbs, and two eggs well beaten. The whole is well mixed, formed into balls and fried in hot lard. After using the chopper, run a piece of bread through it to cleanse the cutter. The Enterprise includes, among its cutters, a fine one designed for chopping nuts, which will be found very useful in making sandwich fillings. Chopped peanuts, walnuts or pecans make very appetizing and nutritious sandwiches for the school luncheon.

French Stew.—Wash three lambs' hearts and cut in slices. Dry slightly and rub well with flour. Add to them one tablespoonful of butter melted in a stewing kettle. Stir the meat until brown, about 10 minutes, then add hot water to nearly cover, a peeled lemon sliced and two bay leaves; cover and cook gently 40 minutes. Stir often and add water if needed. Remove the bay leaves and lemon and add half a teaspoonful of salt and one-eighth of pepper. This dish is cheap and very nice.

Apple Sponge.—Beat the yolks of three eggs with half a cupful of powdered sugar; flavor with lemon; beat for about 10 minutes; add to it the beaten whites of the eggs. Peel three big tender apples; cut them in thin little slices; sift half a cupful of flour with half a teaspoonful baking powder and mix well with the former; put it in a buttered dairy pan and bake in moderate oven for half an hour; spread powdered sugar over and serve.

Pumpkin Pie.—This recipe differs decidedly from those ordinarily used and is very good. Cut the pumpkin without paring, bake it, skin side down, until tender, and then scoop out the pulp and sift it. For one pie allow 1½ cupful of pumpkin, one cupful of boiling milk, one teaspoonful of butter, half a cupful of sugar, half a teaspoonful of salt, one quarter teaspoonful of cinnamon, same amount of ginger; add one egg, beaten separately. Half bake the crust, fill with the pumpkin and bake until it puffs up.

Jellied Beef.—To make this, which is not only good and nourishing, but also inexpensive, two pounds of stewing beef and a piece of shin-bone are required. Have the bone cracked and the marrow taken out; this will serve for another purpose. Put the meat and the bone in a kettle and cover with boiling water; bring to the boiling point, then simmer gently for three hours. An hour before the meat is done add a sliced onion, a bay leaf and half a teaspoonful of celery seed; also a teaspoonful of salt and one-half saltspoonful of pepper. When the meat is done cool; then chop it fine. Soak a box of gelatin in one-half cupful of cold water for one-half hour; then add to it one quart of the liquor in which the meat was boiled; add the beaten whites of two eggs, bring to the boiling point and boil for five minutes, then strain through a flannel or two thicknesses of cheesecloth. Add the juice of a lemon if liked. Cover the bottom of a round mold with two hard-boiled eggs cut in slices, sprinkle with a teaspoonful of chopped parsley, put in the chopped meat and pour the jelly over; stand aside over night. When served, turn out of the mold and cut in thin slices.

Snowballs with Vanilla Sauce.—In a wide stewpan put nearly one pint of fresh milk; season with one tablespoonful of sugar, a pinch of salt and teaspoonful of vanilla. Whip the whites of three eggs to a stiff froth, add four tablespoonfuls of fine powdered sugar and whip again until as smooth and stiff as whipped cream; moisten a teaspoon in the boiling milk, then use it to put in as many spoonfuls of white of egg as there is room on the surface; let boil up; turn over and boil up again; put them when cooked in a deep dish; when all are done add to the milk a tablespoonful of dissolved cornstarch and the yolks of two eggs, stirring continually; cook two minutes and pour over the balls.

Tropical Corn Bread.—This bread has a decided difference in texture and flavor from the ordinary make. Half a cupful of bread crumbs soaked in a pint of milk, two eggs, two cupfuls of cornmeal, a tablespoonful of butter, a teaspoonful of salt; beat the eggs light, and the soaked bread crumbs to a batter; melt the shortening; stir all together until smooth, and bake in tins in a quick oven.

Yarmouth Biscuit.—Mix three-quarters of a pound of sifted flour, one-half pound of sugar and one-half pound of currants to a paste with half a pound of butter and three eggs. Roll out to one-eighth of an inch in thickness and bake a light brown in quick oven.

MOTHERS.—Be sure to use "Mrs. Winslow's Soothing Syrup" for your children while Teething. It is the Best.—*Adv.*

MARKETS.

REVIEW AND OUTLOOK.

THE EGG MARKET is easier, and the price for western average best dropped to 24 cents. Buyers seem to have but little difficulty in getting all they need at that figure. The dullness in fresh goods materially affected the offerings of cold-storage stock, which showed a wide range of prices.

HOTHOUSE PRODUCTS.—At present there is an excessive supply of mushrooms on hand, and there are many reports of cut prices. The receipts of cucumbers are light and quality inferior. Prime lettuce would sell well, but it is scarce, and the lower grades are hard to dispose of.

LIVE STOCK.—Receipts for the week ending December 27 were 11,398 cattle, 307 cows, 2,448 calves, 31,408 sheep, and 33,860 hogs. Native steers brought $4 to $5.30; bulls, $2.75 to $3.50, and cows, $1.75 to $3.70. Prices for milch cows with calves ranged from $30 to $50. Veal calves sold at $4 to $8.50, and grassers, $3 to $3.50. Receipts of sheep and lambs included several carloads for export alive. The market was dull, common to prime sheep selling at $2.25 to $3.80 per 100 pounds, and lambs, $4.50 to $5.90. A lot of choice State pigs sold at $5.40.

BUTTER.—On account of light receipts and cool weather the market is firm, though prices show no advance from last report, 25 cents being the top for extras. Now and then a lot grading exceptionally high sells at one-fourth to one-half cent advance, but there are not enough deals of this sort to warrant a quotation. The conditions on the lower grades were not so favorable, some showing a decided weakness. An occasional lot of storage creamery reaches 23 cents, but for offerings that show age the demand is light, prices in some instances dropping to 17 cents.

MILK.

New York Exchange price within 26-cent freigh zone, 3¼ cents per quart.

BUSINESS BITS.

THAT seems to be a convenient and useful tool advertised by N. B. Foote Co., Frederickstown, O. It almost oils a wagon itself, and there is certainly no need of the operator soiling his hands.

RIGHT now would be a good time to make plans for sugar-making in the Spring. If you need a new evaporator we invite your attention to the I X L, made by Warren Evaporator Works, Warren, O.

FARMERS contemplating building new fences will do well to write for the catalogue published by the Frost Wire Fence Co., of Cleveland, O., makers of fence consisting of all large size hard steel coiled spring wires for laterals, and heavy spring wire stays for uprights, thus insuring many years of satisfactory service.

HAPGOOD MFG. CO., Box 177, Alton, Ill., are offering "Anti-Trust" steel ranges direct to farmers, thereby saving to the buyer the expense and profit of an army of middlemen or agents. If you are not in need of a range at this time, it would be well to ask for the free catalogue of this house and compare their prices on other goods with those of your local dealer.

IF you are interested in bone cutters, we would say that you can probably secure considerable information regarding the poultry business, and at the same time learn something about bone cutters, by sending to W. J. Adam, Joliet, Ill., for his new catalogue, which is due every subscriber of this paper, and which will be sent upon application.

WE call attention to the advertisement of the Michigan wheelbarrow seeder, which appears in another column of this issue. This machine is one of the handiest things the farmer can own, and costs very little. Write the makers, the Seeder & Hammock Chair Company, at Homer, Mich., for free catalogue and special introductory prices. They ship it on trial and guarantee satisfaction.

THE potato crop, as a rule, was very light in this section, and I think that there is not a large quantity stored in this part of the county. The corn crop this year was one of the best ever known, and I think, aside from the potato crop, there has been a fairly good average of production, with a little better price than usual. The turnip is more in evidence here locally than the potato, and brings from 15 to 20 cents per bushel. P. E. T.

Long Island.

A CABBAGE REPORT.—I judge there is fully one-third more cabbage packed away this year than last, in this State. However, I think fully one-third of the stock was badly damaged before being cut from the field by the hard freeze the early part of November, and a good portion of this will never be shipped. The frozen stock is mostly in the hands of the growers, and dealers will be very shy of it. Prices at present at loading points in this station are just half what they were last year at this time. Speculators and growers are not offering this holding very freely at present prices. It seems to be the general opinion here that prices will take a sharp advance soon after January 1. A. M. M.

Apulia, N. Y.

Wants, For Sale or Exchange

FOR SALE—Traction Engines and Thrashers, 2nd hand, cheap. F. A. Booth Co., Stanley, N. Y.

Farm Managers, Gardeners, Buttermakers, etc., always on hand. No charges to employers. Write us. Rural Science Agency, Durham, N. H.

WANTED—I want to hire a foreman for a general nursery business. State age, experience and references. Address E. I. MARTIN, Redlands Nursery, Redlands, Cal.

FOR SALE—Farm of 247 acres, five miles from Battle Creek, Calhoun County, Mich. Good buildings, barn and improvements. H. B. McGRAW, 917 Williamson Bldg., Cleveland, O.

COUNTRY SEAT FOR SALE.—250 acres, suitable for game preserve and stock farm; northern New Jersey; railway station on property; connections with New York and Philadelphia. Game and trout stream; large orchard; abundance of nuts: woods; springs; large house, heated with hot water. Coal yard and creamery on property. A rare chance. Address Box 84, Allamuchy, N. J.

GLENN RANCH,

Glenn County, California,

FOR SALE IN SUBDIVISIONS.

This famous and well-known farm, the home of the late Dr. Glenn, "the wheat king," has been surveyed and subdivided. It is offered for sale in any sized government subdivision at remarkably low prices, and in no case, it is believed, exceeding what it is assessed for County and State taxation purposes.

This great ranch of 40,000 acres runs up and down the western bank of the Sacramento River for 15 miles. It is located in a region that has never lacked an ample rainfall, and no irrigation is required.

The river is navigable at all seasons of the year, and freight and trading boats make regular trips.

The closest personal inspection of the land by proposed purchasers is invited. Parties desiring to look at the land should go to Chico, California.

For further particulars and for maps, showing the subdivisions and prices per acre, address personally or by letter,

F. C. LUSK,

Agent of N. D. Rideout, Administrator of the Estate of H. J. Glenn, of Chico, Butte County, California.

WE PAY $18 A WEEK AND EXPENSES to men with rigs to introduce our Poultry Compound. Send stamp. Javelle Mfg. Co., Dept. 26, Parsons, Kan.

Are You Deaf??

All cases of DEAFNESS or HARD-HEARING are now CURABLE by our new invention; only those born deaf are incurable. HEAD NOISES CEASE IMMEDIATELY. Describe your case. Examination and advice free. You can cure yourself at home at a nominal cost.

Premium Contest.

During the last week or two we have had lists from club-raisers who had done nothing before in this contest. If they keep on until January 15, they are likely to distance some of those who have been sending small clubs from the beginning. But there is little time left now for delay. If you want some of this cash January 15, just hustle around now. It would pay you handsomely to put in every hour of spare time from now until the last night of the contest. The $2 went to these people last week :

Dec. 24. F. E. Van Eps, New York.
Dec. 26. B. C. Foster, New York.
Dec. 27. Wm. Pickhardt. New York.
Dec. 28. Mrs. C. B. Curtis, New York.
Dec. 29. Chas. E. Bryer, New York.

Your name ought to be in this list next week. There are 50 cash premiums besides that will soon be in somebody's pocket. You can have one of them if you will.

THE RURAL NEW-YORKER,
NEW YORK.

MARKET BRIEFS.

Picked Up Here and There.

CHRISTMAS POULTRY.—Until the first of this week the weather was favorable for handling dressed poultry, but the two or three warm, muggy days changed conditions so that the situation was nearly as bad as at the close of the Thanksgiving market. Prices dropped, selected hen turkeys selling at 10 cents, and large quantities of lower grades going at nine cents or less. A good many shipments were sticky when opened, and spoiled quickly. Chickens and fowls were plenty, and the demand weak. Of course, whatever stuff was fit to be held was put into storage, and will be worked off this week for the New Year trade, unless fresh receipts are unusually heavy.

THE SMALLPOX SCARE in this city has made a harvest for the doctors. During the past two or three weeks probably 500,000 people in this vicinity have been vaccinated. The Board of Health has several depots where people may be vaccinated free of charge, but nearly everyone who has a family physician prefers to have him do the job. The ordinary charge is $1. It takes less than three minutes to do the work, and the virus required costs less than 10 cents. Some of the latest outfits contain a special needle used for making the wound, and this is broken up and thrown away when used, so that there is no danger of carrying disease from one person to another by using the same instrument repeatedly. Another improvement is a wire or celluloid shield which is put on the arm as a protection against the sore being irritated by the clothing.

MISTLETOE for holiday decorations was a scarce article this year, and sold at prices far above the reach of ordinary pocketbooks. The reason was that part of the cargo intended to supply the Christmas trade heated and spoiled on shipboard, and there was no time to get a further stock here. Little sprigs of the genuine European plant sold from 25 to 50 cents each. This plant is a parasite growing on a variety of trees in Europe, and quite destructive to the apple in some districts. The seeds dropped by birds adhere to the bark of trees, grow, and draw their life from the tree. Varieties of mistletoe are found in the United States, but they differ in several particulars from the European plant. There was plenty of fine holly, and a large armful could be bought for 25 cents. Its dark green shiny leaves, red berries, and lasting qualities, make it about all that could be wished for decorations. Some holly is also imported from Europe. It is slightly different from the American plant, and is preferred by some, but is only sold by florists with a high-class trade.

STRAWBERRIES in limited quantities are being received from Florida and California, bringing from 60 to 75 cents per quart wholesale. A man who has been shipping regularly to one party here for several weeks, recently sent a crate on trial to another dealer, who sold it at 15 cents per basket more than the other man had been getting. The first man heard of this, and on the next crate he got made returns at 10 cents per basket above the latter price. Probably he advanced the extra money from his own pocket in order to prevent the new man from getting any further shipments, as the price at which he claimed to have sold them was considerably higher than the market warranted. This is a common practice carried on by some commission receivers to hold the trade of shippers. It is simply a sort of stage performance, the man who puts up this bonus getting even by making short returns now and then. A fruit firm here had handled the strawberries of a certain section, amounting to several thousand dollars, for a number of years. The berries were of good quality, and they had taken the trouble to work up a special trade for them at unusually high prices. Another fruit dealer went into that section, and by representations that he had better facilities for handling their product, induced them to give him a trial for a season. For the first two or three shipments he returned big prices, and after that they dropped off to something less than they had got in former years, the loss on the whole season being heavy. Next year the growers offered the crop to the parties who had previously handled it, but to their astonishment the offer was declined with thanks, the dealers stating in effect that they had been to considerable trouble to get an outlet for these goods at high prices, only to have the trade taken away from them at the most favorable time, and they did not care to run the risk of further similar treatment. W. W. H.

CONNECTICUT FARMERS MEET.

The annual farmers' convention of Connecticut, held at New Haven December 11-13, was more than usually interesting. President Hadley, of Yale University, had for his subject, Higher Education and the Welfare of the Country. He said in opening that higher education helps the community in three distinct ways; by making people better workers in their several occupations, better members of the body politic, and better men in their character and ideals, and his presentation of his reasons for the statement were scholarly and instructive. To Col. James Wood, of Mt. Kisco, N. Y., was assigned the pleasant duty of telling what the Farm as a Home should be, and it goes without saying that he did it well. Dr. W. C. Sturgis, of New Haven, spoke upon the study of botany, claiming that it was not necessary for the student to acquire a scientific knowledge of botany in order to make the work pleasant and useful. One should be thorough about what is done, as guessing around among plants is of no use. Ex-Gov. W. D. Hoard, of Wisconsin, gave two lectures upon Modern Conclusions in Dairying, and What Constitutes a Dairy Farm. The Governor's opinions are fairly well known. He thinks the general-purpose man, the general-purpose cow and general-purpose methods go together, and that the average man with his average cow and average cost of keeping will produce average results. Most Connecticut farmers who attend farmers' conventions agree with him. Dogs breed often, and would be good animals to experiment with for general purposes. When they can breed a general-purpose dog that will run a fox all day, stop on a bird at scent, drive cattle and sheep, with a chance to win in a dog fight, it will be time for us farmers to try to breed a cow that will do any one of half a dozen different things, as we ask of her. Gov. Hoard has a barn built with the King system of ventilation, and thinks very highly of it. He is enthusiastic also about Alfalfa. When properly cured, which requires from two to four days in heaps covered with hay caps, he thinks it excellent forage. After hearing Gov. Hoard tell how he prepared the land for the seed, some of our farmers might think our friend Geo. M. Clark's five tons of good hay a surer thing than a crop of Alfalfa, and sow grass seed instead. There seems to be no chance for Alfalfa unless the preparation of the seed bed is up to the mark, while if there was a little lacking, Clark's style of seeding would give something.

Prof. Charles D. Woods, of Maine, gave a very interesting lecture upon the secretion of milk, but being almost entirely scientific it cannot readily be briefed. J. H. Hale, of peach fame, talked of the lessons of 1899 and 1900 in pomology. He believed the time for marketing fruit in barrels was about ended, and the fruit of the future, like apples and pears, would be sold in bushel boxes while a still smaller box, that a man might carry home to his family, might profitably be used for these fruits, and for peaches. His point was that when a package was broken the cost to the consumer largely went to the retailer, while an unbroken package would be sold at a fair percentage of profit. He believed the best markets would in the future demand a red apple grown east of the Hudson River, as that section of the United States grows the best apples in the world. Asked to name the best strawberry, Mr. Hale said there was no one best berry, but named several varieties, among them Glen Mary, Gandy and Pride of Cumberland. Dr. J. F. Rothrock, of Pennsylvania, considered the forestry problem largely affecting the retention of water and prevention of freshets and droughts, by forests. Attention was called to a statement by Mr. Hale that the fewer trees there were in an orchard the less danger from drought, as the roots of trees drew water from the ground and the leaves threw it off faster than it evaporated from the soil. Dr. Rothrock thought tillage prevented evaporation. One farmer well along in years said that in his boyhood he ate his dinner in haying time by a spring in a meadow. A maple tree in later years grew over the spring, and while it made a nice shade to eat dinner under, it spoiled the spring, no water running from it; and as the spring was the more valuable of the two it was cut down. The discussion practically closed with the statement by Prof. Brewer, of Yale University, that more than one-third of the area of Connecticut is, and must continue, forests, owing to the rough nature of the land.

At the last evening session Col. N. G. Osborn, editor of the New Haven Register, talked of the farmer in public life, and made an earnest plea for honesty in politics and a regard for the welfare of States as a whole rather than of particular sections. The three days' meeting closed with an entertaining paper by Mrs. C. W. Pickett, wife of the editor of the New Haven Leader, Reminiscences of Farm Life. Heretofore Connecticut farmers' conventions have been enlivened by music secured for the entire convention. The music at this convention was, both vocal and instrumental, by New Haven people, who gave their services, most of them for a single performance. This gave a variety that was extremely well-liked by those who attended the convention, particularly as the music was of a very high order. There was a fair exhibit of fruit, nuts and corn, but nothing particularly new. It was a matter of remark that Northern Spy apples were remarkably fine in Connecticut the past season, but no one seemed to know why. Perhaps dry weather suits the Northern Spy. R. S. HINMAN.

A Spotless Skin

And a clear complexion are desired by every woman and admired by every man.

Eruptions, pimples and similar blemishes are caused by an impure condition of the blood. These skin blemishes are permanently removed by the use of Dr. Pierce's Golden Medical Discovery which thoroughly purifies the blood and cures the cause of the disease.

"For about one year and a half my face was badly broken out," writes Miss Carrie Adams, of 116 West Main St., Battlecreek, Mich. "I spent a great deal of money with doctors and for different kinds of medicine, but received no benefit. At last I read one of your advertisements in a paper, and obtained a bottle of Doctor Pierce's Golden Medical Discovery. Before I had taken one bottle of this medicine I noticed a change, and after taking three bottles I was entirely cured.

Free. The Common Sense Medical Adviser 1008 pages, is sent free on receipt of stamps to cover expense of mailing *only*. Send 21 one-cent stamps for paper covered book, or 31 stamps for cloth binding. Address, Doctor R. V. Pierce, Buffalo, N. Y.

WATCHES

(Full Jeweled).

WALTHAM AND ELGIN ONLY.

High-Grade Watches at Low Prices.

Some of our people will want watches this Fall. Our people are used to good things, and will want good watches. We have selected some of the most suitable made by the great American Waltham and Elgin factories. None other so good are made any place in the world. Every watch is warranted, and may be returned at our expense, if you do not want it when you see it. No jeweler can afford to sell them at these prices. They are all stem wind and set. We sell at these prices to subscribers' families only.

No. 1. Men's Solid Gold Watch.

FULL JEWELED, NICKEL WORKS.

No. 1 is a Men's size, solid 14k. gold watch, with either Waltham or Elgin works as ordered. The works contain 15 jewels, compensation expansion balance, safety pinion, and all improvements. The case is either open face or hunting as ordered. At retail such watches sell from $50 to $75 each. We will deliver one to any of our readers in good running order for only $35.

No. 2. American Special.

MEN'S 14K. GOLD-FILLED WATCH.
Full Jeweled, Nickel Works.

No. 2 is a genuine Waltham or Elgin watch, with full jeweled nickel works. It contains all the improvements mentioned in No. 1. The case is made of solid 14k. gold, in two thick plates, stiffened between with a sheet of fine composition metal. It is guaranteed to wear like solid gold for twenty-five years or more. With proper care it will last a lifetime. Price, delivered in good running order, $17.50.

No. 3 is just like No. 2, but open face, screw back and front. Price, delivered in good running order, $14.40.

No. 4. Sterling Silver Watch.

MEN'S WALTHAM OR ELGIN.
Full Jeweled, Nickel Works.

No. 4 is a genuine Waltham or Elgin watch with works just like those in No. 2 and No. 3. The case is made of solid sterling silver, and it weighs three ounces. We have tried two-ounce and four-ounce cases, but we find that the three-ounce case is just the right weight. It is heavy enough to protect the works perfectly and at the same time it is extremely handsome. It is hunting or open face as ordered. Price, delivered in good running order, $12.

No. 5. Waltham or Elgin Watch.

FOR MEN AND BOYS.
Full Jeweled, Nickel Works.

No. 5 is a very serviceable watch for men and boys. The works are just the same as those in No. 3. The case is made of nickel silver, screw back and front, thereby making it dustproof. Nickel silver is a composition metal that looks and wears like solid silver. Price, delivered in good running order, $7.75.

No 6. Ladies' Solid Gold Watch.

FULL JEWELED, NICKEL WORKS.

No. 6 is a genuine Waltham or Elgin watch for ladies' wear. The works contain all the improvements mentioned in offer No. 1. The case, hunting only, is solid 14k. gold, with plain or fancy engraving as ordered. This is not a cheap watch. It ordinarily sells at from $40 to $60. We will deliver one in good running order to any reader for only $30.

No. 7. Ladies' Waltham or Elgin Watch.

14K. GOLD FILLED CASE.
Full Jeweled, Nickel Works.

No. 7 is a ladies' hunting case watch of high merit. The works are just like those in No. 6. The case is made of solid gold in two thick plates stiffened between with a sheet of fine composition metal. It is guaranteed to wear like solid gold for twenty-five years or more, and with careful use it will last a lifetime. Price, delivered in good running order, only $14.50.

THE RURAL NEW-YORKER, NEW YORK.

Nebraska the land of plenty

Why is it that so many men spend their days on rented farms, with no prospect ahead, when within a few hours' ride is a land of plenty; where all kinds of grain and fruit can be raised with the least amount of labor; where cattle and hogs fed on corn bring a handsome profit; where the climate is healthful and churches and schools abound, and where land is cheap. Send to-day for our illustrated booklet "Nebraska." It is full of pictures and has a valuable map. Free.

WESTERN AND EASTERN BUTTER.

Should the Price Vary?

We notice that western creamery butter runs from one-half cent to one cent per pound higher in this market, than State creamery. In Summer, the difference appears to be less than in Winter. Will you tell us why this difference should be made? Is the western butter more uniform or generally higher in quality? If so, why? Are any discriminations made in favor of western butter? If so, what are they? Is there any fair reason why this difference in price should be made?

I find that the prices of both run about alike, although there are two reasons why State creamery does not occupy the first rank in the daily quotations. The larger part of our State creamery goes directly to the dealers and consumers, instead of the regular channel of distribution; the daily quotations are reported upon the sales of the commission trade. The large buyers of creamery butter give preference to western creamery, for the reason that they are able to obtain large lines at regular intervals, while the choice in State creamery is limited. F. J. H. KRACKE.

I have had little practical experience in the butter market, but have watched the course of the market carefully for the last four or five years, and have of course, observed the feature to which you call attention. So far as I know there are no discriminations made in favor of western butter, but perhaps it would be better to say that sufficient reason may be readily found for this difference in price. I think there is no doubt but that the practice of so-called Winter dairying, that is, having cows fresh in the Fall, is more extensive in western dairy districts than in New York or Pennsylvania. This will result in a larger proportion of fresh milk and less "stripper" milk in the West than the East, and consequently butter of a higher flavor and better texture. Another reason is found in the fact that a considerable proportion of the creameries in this State run only every other day during the Winter season. This means a greater proportion of old and often frozen milk, and a consequent loss in flavor. I am of opinion also that another condition exercises considerable influence. A large number of those creameries in this State that make the most and best butter in the Winter have private customers for their make, and their butter does not get into the regular channels of trade, going direct to the consumer, so that only the poorer creamery butter is represented in the open market, and in much larger proportion in the Winter than in the Summer. H. H. WING.

The flavor in butter, other conditions being the same, is largely influenced by the length of time which the cows from which the milk is drawn have been giving milk; i. e., milk drawn from cows which are nearly fresh produces better-flavored butter. My observation leads me to believe that the western farmers more generally begin their dairy season in the Fall or early Winter. This they have been doing for several years, and are better skilled in the care of milk in cold weather, have better facilities for protecting it from freezing, and at that season of the year the milk reaches the creameries in much better condition than in this State. Another factor which may have some influence is the fact that what are termed "long lines" of desirable quality bring better prices than smaller ones. A factory which can offer 100 packages of extras each week can usually get a slight advance over one having only from 15 to 25, and I think in the West the creameries generally are less in number and have a larger output. I doubt whether there is actually any difference in prices in favor of western butter during the Summer, quality and other conditions being the same. The prices on the Jamestown Board of Trade during the months of May, June, July and sometimes in August are usually in advance of the Elgin quotations, and sometimes have been higher than the New York quotations of the same date. This would tend to show that New York State butter, all conditions being the same, stands as good a show as western butter. Yes, I think the western butter is generally more uniform in quality.

J. P. CLARK.

COW LEAKS HER MILK.

I bought a very fine Jersey cow last Fall; she was nearly dry at the time, and due to give milk again the last of December. Since buying her I learned that she leaks her milk badly when in full flow. I have read somewhere about searing with a hot iron the end of the teat when the cow was dry. Can you tell me if this can be successfully done, and give me instructions concerning it? It seems to me it must be a delicate matter, as the milk passage might be entirely closed. There is no veterinary near at hand, but perhaps I might do it myself. If the defect can be remedied she is valuable; if not she is nothing more than beef. W. MCK.

Gabriels, N. Y.

It is often a difficult matter successfully to operate upon the teats of a cow that leaks her milk, so as entirely to prevent the trouble. Where only one teat is involved the case is not so bad; but to make all four teats sore will be met with vigorous resistance to the treatment, from the cow. In the case of valuable animals that leak their milk only on flush feed, when the udder is unusually disturbed, the temporary leaking can be prevented by the application of collodion after each milking. Dry the ends of the teats and then make two or three applications of the collodion to each teat. At the next milking the layer of collodion is picked off, to be renewed after milking as before. The most practical method, where successful, is to cut or burn the end of the teat sufficiently to form a good scab. In healing, the wound should contract so as partially, if not entirely, to close the opening. To cut the teat use a teat-slitter or bistoury, making an incision in four or five directions. Burning with the hot iron I have found to be more successful than cutting. Either operation ought to be performed by a competent veterinary surgeon; but where this is impracticable, the firing would probably be the safer method. Use a smooth-pointed iron, preferably with a large head to retain the heat. Heat the iron to a red heat, and having cast and secured the cow, burn the orifice of the teats by making three or four momentary applications of the hot iron to each teat. The iron should not be in contact with the flesh longer than two seconds at one time, repeating the applications, passing from one teat to the other, until burned sufficiently to form a good eschar. No after treatment is necessary beyond squeezing a little milk from the teats night and morning after the third or fourth day. Do not pick the scab off, but simply force a little milk from the teat to keep the orifice open; or if the cow is in milk, milk very carefully. Should the orifice close entirely, force an opening with a small milking tube, or with a large knitting needle with a well-rounded end. If the first operation is not successful all around a second may be attempted after the teat has entirely recovered from the first.

F. L. KILBORNE.

ACCORDING to the Breeders' Gazette, to "rustle the chuck," in cowboy vocabulary means to prepare a meal for eating. Chuck is the term for food, or "grub," and rustle means to stir around and get it ready.

A COW REPORT.—I send a report of one herd of cows. This was for last March, and given by G. A. Blish, a prosperous farmer, at one of our Grange meetings.

Mareh, 1900: Cows kept, 31 to 36; milked, 27 to 32; average, 30. Quarts of milk, 9,607, wholesaled at 3¼ eents, $312.22. Amount of grain fed to eows:

24 barrels eorn and 36 bushels oats	$33.12
Grinding the same	2.40
3,950 lbs. gluten	46.65
3,100 lbs. mixed feed (bran)	29.45
9 tons hay	130.00
Cornstalks	5.00
20 bu. small potatoes	4.00
Soft corn	3.00
Nutritone (medieine)	.75
Salt	.25
Total cost of keeping	$254.62
Cost of keeping the herd good by trading eows	30.00
Total	$284.62
Balanee in favor of the cows	27.60
Manure from cows	30.00
Total	57.00

No account was made of labor.

M. D. INGHAM.

Sec. of Granby Grange, Mass.

PULP AND MOLASSES.—As regards beet pulp, I think it is worth not far from $2 per ton when bran and cornmeal are worth $18 per ton, and some might consider it worth more than that. I have 27 cows, am milking 22, and am feeding about 1,200 pounds of pulp per day, giving each animal a large scoop full twice a day; silage once a day and hay once a day. I give no feed at noon. A neighbor and myself take a carload together. I got out of pulp for two days, and my cows shrunk on their milk 15 quarts per day. The pulp costs 50 cents per ton at the factory loaded on the car, and the molasses three cents per gallon, and return the barrel. I have never fed any of the molasses, so cannot say much about it. Some of my neighbors fed it last year and liked it very much. I have not heard of anyone using it this year. C. R. S.

Horses, Cattle, Sheep and Swine

$2 Book for $1

We have yet some copies left of a lot of slightly shelf-soiled books of **Horses, Cattle, Sheep and Swine,** by Curtis, that we will mail postpaid as long as they last for $1. This book is the standard work on live stock. It is used as a text-book in almost all agricultural colleges, and is indorsed by all leading authorities on live stock It is a large book, fully illustrated, and requires 16 cents to pay postage alone. These copies are in condition for any library, and will be reserved for subscribers alone. They will not be sent at this price to dealers. They are a great bargain at the price for anyone who wants to make a study of animal husbandry.

THE RURAL NEW-YORKER, NEW YORK.

PROBLEMS OF DAIRY PRACTICE.

Handling "Devonshire Cream."

Can you tell me what Devonshire cream is, and whether it takes any special machinery to make it? Taking 80 cents per gallon for cream as a basis, does it sell for enough more to leave a profit above the labor? B. P.

Hartwell, O.

Devonshire cream is a heavy clotted cream, so named because first made in the county or shire of Devon in England, which is also the home of the Devon cattle. In an article in THE R. N.-Y. of January 22, 1898, entitled In Transatlantic Dairies, Prof. H. H. Wing speaks as follows of this cream as made in Devonshire; "The milk is set in shallow pans—crocks—and warmed until it just begins to crinkle; then it is set aside until the cream rises. Sometimes it is rewarmed and set aside for the second time. The cream is then taken off for table use, and eaten on bread. It is rather lumpy. I cannot say that I ever found it absorbingly delicious over other cream." So far as known to the writer no special machinery is made for this purpose in America. The inquirer does not state whether he is selling a 20 per cent or a 50 per cent cream for 80 cents per gallon, so it is not possible to estimate the profit. For a special market requiring a heavy cream it might be advantageous to experiment along this line, but for the general market it probably would not pay for the additional labor. J. A. F.

A Trouble With Cheese.

For about eight days in the month of last July, during the hottest weather, the cheese curd would seem to scald all right up to 96 degrees, and above that it would not look as it should, but turn soft and settle in the bottom of the vat, and look milky. The acid would not come on it until two hours longer than the usual time. The cheese now looks all right and is the right consistency, but it has a sweet whey flavor. The trouble was in big blackfly time, and the cows were sprayed at milking time. I have made cheese for three years and have been very successful with it. It brings good prices in the markets.

Hinckley, N. Y. A. N.

As the inquirer indicates, the trouble was probably due to a deficiency of lactic acid in the milk. This might be obviated by warming the milk to a temperature of 85 degrees F., and allowing it to stand until sufficiently ripe, before the rennet is added. The use of an artificial starter would, however, be likely to give the most uniform and hence the best results. Several commercial starters are upon the market, and if the vessels in which they are made are kept clean and sweet, the same starter may be propagated from day to day for from two to three months. The amount of starter needed varies from two to five per cent of the amount of milk, and depends upon the temperature of the air and the condition of the milk when it reaches the factory.

J. A. F.

Butter that Grows Strong.

What is the cause of butter becoming strong a day or two after churning, which mine does? The cow is young; she has had one calf. Will she improve as she gets older? I feed her cornstalks and mangels.

Brighton, N. Y. J. S.

From the information given it is not easy to state the cause of your "butter becoming strong a day or two after churning." In order to make a fine quality butter, the dairy cow should have nothing but the brightest and best of feed. Mangels and cornstalks alone do not make a very liberal ration for a dairy cow, and if mangels are fed in considerable quantity either during or an hour or two before milking, they may be the cause of your trouble. They should be fed directly after milking. Where only one cow is kept, the milk is often set in shallow pans on the same shelves with the food of the family, and readily takes up the characteristic odor of its surroundings. The milk should be carefully and thoroughly strained as soon as it is drawn from the cow, and every care taken to guard it from odors and taints. The cream should be kept at a temperature of 40 degrees or below until the day before churning. The churning should be done at least twice a week, and the same care used to keep the butter in a pure atmosphere as has been suggested for the milk and cream.

J. A. F.

THE BREEDER'S WAYSIDE.

How May the Herd be Improved?

My young friend Bovril has a mixed herd of cows, and he writes me to know what sort of a male he should secure to head his herd. He has grade Shorthorns, Jerseys and Holsteins, and sells milk. The selection of a male to head a herd of cows is a most important matter. There is an old saying that "the bull is half the herd," but sometimes I think him more than half, though strictly speaking he cannot be. To begin with, there really are types of animals which represent the better standard. The best dairy cow should have a large udder when fresh in milk, which extends well up in front on the belly, and high up behind, and which when milked out will shrivel up and not retain a plump outline. This cow also should have a good full chest and strong, level back, and large well-rounded body, that does not incline to fatness. There are other things, but these are the most essential items to consider. The thoughtful breeder should always secure a male from a female that has these highly-desirable qualities, both on the sire and dam's side if possible. He certainly is not wise to buy a bull of whose ancestry he knows nothing. He should see his sire and dam, and grandsire and granddam if he can. Then he will be able to form some idea of what stock he is using. One cannot always tell what a sire is capable of, by mere examination, but if one can see his progeny, then he may form a fair conception of the animal's character. Prepotency in the male is his ability to stamp his qualities on his offspring in a noticeable degree, and so one should seek not only a bull from a prepotent sire, but one that himself shows in his general carriage and build superiority of breeding. It is for this reason that really astute breeders are very careful to buy males coming from sire and dam of known qualities. Not only this, but some families of cattle are distinguished for having numerous representatives that have accomplished certain feats in producing either milk or butter. The advanced registry of the Holstein-Friesian Association, and the butter-test book of the Jersey Cattle Club, show one the names of many prominent individuals of prominent families. Consequently it will be decidedly to advantage to secure a male from a family or strain that has a reputation for accomplishing things.

I would most earnestly recommend that Bovril use a purebred sire on his herd. Bulls from grade stock should not be thought of. Their breeding is an uncertainty, and their offspring will be more uncertain. A grade male is only used by the most indifferent and ignorant of breeders. Now, if I found the right sort of a bull, I should want to use him as nearly as possible on the right sort of cows. So I should have definite views as to the type of cattle I wished to breed, and what they were to be bred for. I should ascertain whether the individuals in my herd were paying their way or not, and those that were not, I should dispose of to the butcher. Then the male should be used on the rest to produce an improved herd of uniform quality. If the bull is prepotent, this will gradually come about. Bovril ought not to cross great extremes. He ought to harmonize the elements. If his herd is mainly Jersey, then it will be desirable to develop the Jersey type if it suits his requirements, but crossing a Jersey on a Holstein is not in itself the most satisfactory thing to do. These breeds are too opposite in character. After improving his grade herd by the use of this male, and weeding out from time to time inferior females, Bovril will see a great improvement in results and appearances. Then the most it will be necessary for him to do will be to secure a new bull in a few years, when fresh blood will be required; always, however, following up the process of selection and weeding out undesirable stock. In connection with this entire subject, one should not overlook the necessity of getting informed as fully as possible about the breeds or breed one is handling, and the principles of breeding. There are many helpful ideas that are coming out from time to time in THE R. N.-Y. and other papers, while books on live stock often suggest much of service to the breeder. You know that the manufacturers of to-day leave no stone unturned to develop their business right up to date. If more of our farmers were inclined that way, their pockets would jingle more than they now do. Study your herd, visit other breeders who are more successful than you, and get ideas from any source you can, so long as they are good ones, and by putting them into practice you will be the gainer thereby. C. S. PLUMB.

HOGHOUSES.—Some time ago I read an article in THE R. N.-Y. in regard to portable hoghouses. I use them altogether. I build my houses upon regular boat runners; all ready to hitch a team to, and move them when and where I wish. With the runners there is no lifting or bother to load the houses on a stone boat; they are ready to hitch the team to at any time. In this way I keep 30 or 40 hogs with a comparatively small amount of labor. I place my houses and hogs on a piece of ground, and let them root and work a while; then I move them to another field. The first field is then in fine condition to plow and raise good crops.

"Planet Jrs Girdle the World"

The "Planet Jr." Year Book for 1901,

like its predecessors, will be the best catalogue of the season. Last year it took 350,000 copies to supply the demand. We have issued a like amount for this year and shall print subsequent editions as required. To those who know us we need only say that the new catalogue surpasses that of 1900. Sixteen full page half tone views made from original photographs will show how they farm at home and in foreign lands. Illustrates fully the complete "Planet Jr." line, comprising Seed Drills, Wheel Hoes, Cultivators Harrows, Two Horse Cultivators, and Sugar Beet Seeders and Cultivators. We mail this catalogue free upon request to everybody having crops of any kind to cultivate. We fit every case from the smallest garden to the largest farm. Prices greatly reduced for 1901.

VOL. LX. No. 2659. NEW YORK, JANUARY 12, 1901. $1 PER YEAR.

THE DESTRUCTIVE GREEN PEA-LOUSE.

IT WILL BE HERE ONCE MORE.

What to Do For It

I have 12 acres of Blue-grass and Timothy sod that I intended plowing last Fall, and wished to plant in peas for canning factory the latter part of April, but I fear the grub and cutworms may destroy it. The seed alone will cost me $108. This is more than I would like to chance if there is danger of the worms taking it.

Indiana. READER.

So far as cutworms and grubs are concerned I see no particular reason why Reader should not plant the Blue-grass and Timothy sod in peas next Spring. I would advise him to be particularly careful about planting peas in that section on account of the universal presence throughout the Northwest, as far as Green Bay, Wis., of that notorious insect known as the destructive Green pea-louse, a complete account of which he will find in THE R. N.-Y. for August 4, 1900. From facts which are now in my possession, and which have been coming to me recently from various sources stretching from Portland, Me., to Green Bay, Wis., I conclude that unless conditions change rapidly, there will be another invasion of the pea louse over wider areas the coming Spring. This insect was breeding in the open field late in October in the northeast part of New York State and other States in the North and Northwest. At present I have large colonies in my laboratory, where it is breeding daily upon cow-peas and other peas. It is not very fond, however, of the former, while it is thriving nicely upon the green field pea. Two seasons have passed, and this little insect has been responsible for the destruction of green peas in the field to the extent of more than $7,000,000; during this time, we have had weather conditions of quite different character prevailing throughout the Fall, Winter and Spring of each year, and, at the same time, the total loss to the growers over the area where the insect has made its appearance in destructive numbers is greater by far this year than it was one year ago. Early in the Spring we predicted the presence of this insect throughout the Northwest and more northern States, and sent out a warning at that time, so that persons planting peas could be on their guard.

As a matter of fact, therefore, I unhesitatingly state that the Indiana correspondent takes far greater risk in planting his peas in the Spring from the attacks of the Green pea-louse than he does from their destruction by grubs or cutworms or other insects. It has been demonstrated beyond all question of doubt that where peas have been drilled like wheat it is practically impossible to fight this insect with any degree of satisfaction. Wherever peas have been drilled, especially the late plantings, and where this insect has secured a hold upon them before the blooming season, they have been invariably killed outright, or reduced in vitality to such an extent during the past season that they were not worth cutting; on the other hand, where the peas have been planted in rows from 26 to 30 inches apart, there has been a better opportunity afforded for combating this pest, and in most cases where persistent and energetic work was followed regularly with the brush and cultivator method, cited in the article referred to in THE R. N.-Y., the peas were saved to a very great extent. In one instance, the owner who had planted 600 acres canned between 25,000 and 30,000 cases of two dozen cans each, while the previous year, where his peas were drilled, he lost a total of 480 acres outright, or on a cash basis something like $20,000 or $25,000.

My general advice, therefore, for persons who intend planting peas in the Spring would be for them to secure the early varieties, and get them in the ground as early as possible. In the central Southern States this can be done in many cases in February or March, while in the Northern States I realize it will not be possible to get them in the ground until much later, but wherever the pea is planted for canning or commercial purposes, it must be borne in mind that every precaution should be taken to have the peas in such a condition that this insect can be combated by means of the instruments and methods now demonstrated, whereby it can be kept in check, provided it makes its appearance. So far as varieties are concerned, some varieties are more susceptible to the attacks of insects than others; as an illustration, the variety known as Alaska will no doubt resist to a very much greater extent the attacks of this insect than the variety known as the French Canner, which has a different method of growth, the stem and terminal bud being much more delicate and the leaves much more succulent than those of such varieties as the Alaska and others of a similar character. The varieties known as First and Best and the Alaska have been, perhaps, more generally planted in this section than any others, but in every case, all varieties have succumbed to the attacks of this insect, where they have been thoroughly established upon them before the blooming season. In making preparation, therefore, for the planting in the Spring, the grower must prepare himself with the implements for making a determined and persistent warfare against this pest, with the brush and cultivator method, as soon as the creature makes its appearance, by getting the peas in the ground early, and with fair weather conditions, the plants getting a start and blooming before the insect really establishes itself to any extent upon the vines, the grower has a very good opportunity of securing at least a fair crop, even with an invasion of insects following latter.

Some workers have generally recommended a spraying method for checking and controlling this pest. We were of the same opinion early last season, but after one season's work we have practically demonstrated that no system of spraying is of any special value on a large scale, and I would, therefore, discourage the use of spraying apparatus and spraying material of any kind upon fields of peas infested with this insect, and would especially recommend the use of the brush and pan, or the brush and cultivator method, both of which have been described in previous communications to THE R. N.-Y.

In the accompanying illustration, FIG. 7, a fair idea can be gained of the brush-and-pan method, which we have used for the control of the pea-louse.

[Prof.] W. G. JOHNSON.

FIGHTING THE PEA LOUSE WITH BRUSH AND PAN. FIG. 7.

R. N.-Y.—Those who buy canned peas have only to ask the price of a good sample to realize how this pea-louse has affected trade. In some districts the pack was scarcely half that of former years. If Prof. Johnson is right in his estimates for this year, there will be more trouble than ever. The very fact that this insect is so hard to fight makes it all the more necessary to follow as closely as possible the few lines of warfare which the entomologists have been able to work out. We give considerable space to the matter, as a good majority of our readers are interested in pea growing, either in garden or in field. Of late years the pea crop has been popular with many farmers, who supply canning factories. Prices are now so high that it will be a great temptation to some farmers to put in a large acreage this year. It is our duty to warn them that they must be prepared to put up a stiff fight against this pea-louse. The cannery shark will take advantage of the high prices paid for canned peas to try to work his fraudulent schemes in many neighborhoods. His tongue will blast your pocketbook worse than the plant lice will wilt your peavines. Between the two there will be nothing left for you. Of course this pea-louse, like many other injurious insects, gives to some growers the chance to turn a curse into a blessing. That is a singular thought, and yet it is true. The louse is sure to reduce the general crop of peas, because the great majority of growers will not fight it successfully. Therefore those who are able to resist it and thus obtain a fair crop will find that the louse has given them a partial monopoly which means a better price.

SEEDING A SWAMP TO GRASS.

I have about 30 acres of land which I wish to seed down for pasture. Four years ago it was a dense spruce and huckleberry swamp. In 1897 the timber was all killed by fire, and soon blew down. In 1898 the fire made a clean job of everything; also about six inches of the ground. It seems hard to get a catch of Timothy. The land is never covered with water only around the edge; the soil is a deep muck. Will some one advise me from experience what seeds to sow on this land to bring a good catch and make good lasting pasture? F. F. H.

Decker, Mich.

If the soil is composed of coarse more or less fibrous peat to a depth of two or three feet, sufficiently pure so that it burns readily when dry, as is suggested by the statement that about six inches of the ground burned, it may be that the land will have to be worked for two or three years without getting very much crop from it until the soil has become more compacted, and in better condition to utilize the ground water. One of the most serious difficulties with soils of this character after they have been drained is their tendency to suffer for lack of water in the surface three or four inches, and plants with small roots which develop slowly, as is the case with grass seed and clover, are liable to die out purely on account of lack of moisture. Such ground has to be treated, and crops grown upon it which root deeply in a comparatively short time until it is more decayed. If this is the condition of his soil, F. F. H. would better try to grow either oats for hay or else corn for a year or two. If he tries to grow oats it would be well to try seeding at the same time, but to cut the oats as soon as they begin to lodge badly, so as to be liable to smother out the grass, in case the grass shows signs of making a fair success. It frequently happens that after such pieces of land have been burned over to the depth stated, that grass seed, like Timothy, Redtop or Blue grass will do well upon it for one or two years, and sometimes permanently, the burning rendering available sufficient potash, and changing the texture sufficiently to put the soil in much better condition. If the soil is a fairly-decomposed type of muck or black soil, the probabilities are that before F. F. H. can succeed in growing remunerative crops of any kind upon it it will need to be given a dressing of farmyard manure, or else a treatment of some potash salt. The farmyard manure is apparently preferable to the potash salts, at least so far as our studies indicate. An application of 15 to 20 loads per acre would probably put the soil in good condition for corn, or for seeding to grass with oats or some similar crop. If he wish permanent pasture I would recommend the seeding with a mixture of Timothy, Blue grass and Red-top. It would be necessary, if seeded with oats to watch the conditions, and if the oats became too heavy and are falling badly they should be cut for hay rather than be allowed to mature, and it will probably be better to cut for hay in any case rather than risk the drying out of the soil which they are likely to produce if they come to maturity. The oats should be sown thin on the ground, so as to avoid too much shading, and the tendency to lodge.

[Prof.] F. H. KING.

ASPARAGUS GROWING IN THE SOUTH.

How to Insure a Good Crop

THE FIRST YEAR.—We select high dry sandy land; asparagus does not do well in this section on moist, or clay lands. We first plow the land, turning it as deep as possible without turning up the sand. We then harrow it thoroughly, lay it up with a bull-tongue plow in rows six feet apart. We then throw the land up into large beds with a turn plow, leaving in the V-shape shown at Fig. 8. We then take a long-handled shovel and clean the alley down to the sand subsoil; after this is done we set out the one-year-old roots, 24 inches apart in the alley, dividing the roots lengthwise, and put a large handful of earth on the roots on each side of the crown to hold the plant in position. When this is finished we sow at the rate of 1,000 pounds per acre of fertilizer composed as follows: Five per cent ammonia, seven per cent potash, five per cent phosphoric acid. When the fertilizer is applied we run an Iron Age cultivator on each side of the ridge, letting the mule walk up on the side of the ridge. This throws about six inches of soil on the roots in the alley. The grass comes through this covering inside of one month When it comes through nicely we sow 1,000 pounds more of the same fertilizer in the alley on the roots, and keep on cultivating throughout the Summer with the cultivator, keeping the land clear of grass and weeds. November 10 the grass put in last February was now about as high as a man's shoulder, say four feet. This winds up the first year's cultivation in our section.

SECOND YEAR'S CULTIVATION.—In December we cut down the asparagus tops, and either haul them into the lot as bedding for the mules, or burn them in the field; we then commence in the center of the asparagus alley with a single-horse plow, and plow the soil away from the roots, taking care not to run too deep, and apply 2,000 pounds of fertilizer of the same grade per acre, 1,000 pounds on each side of the asparagus roots. After the fertilizer is applied we run a diamond-tooth single-horse harrow twice in between the rows of asparagus to level the land and make it fine; then we take the single-horse plow and throw the earth back to the asparagus, bedding the earth up over the crowns of the asparagus about 10 inches, using a solid 18-inch sweep to finish up the alley between the asparagus as shown in the lower picture, Fig. 8. We cut only the finest stalks of asparagus the second Spring, and do not cut very long usually. We get enough asparagus the second Spring to pay for the fertilizer used the second year. The third Spring we get a full crop of grass; thereafter we always use one ton of fertilizer every Spring on the asparagus beds. Sometimes after we are

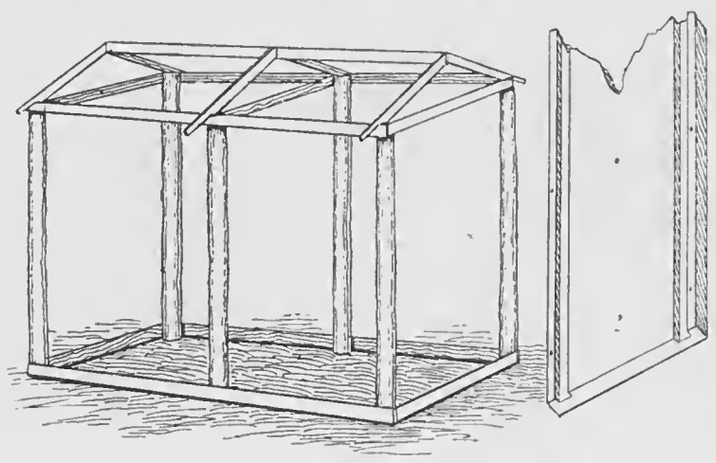
PLANTING ASPARAGUS IN THE SOUTH. FIG. 8.
Upper figure shows how the roots are planted; the lower figure shows them at end of second year.

through cutting in May we apply 1,000 pounds of kainit per acre, but have never seen any result from it. We commence cutting sometimes as early as the latter part of February; the usual time is from March 1 to 10. We cut until May 10. As soon as Norfolk comes in we have to stop. Some years we change the fertilizer and apply 1,000 pounds of the regular mixture, and 1,000 pounds of cotton-seed meal. I imagine a change of fertilizer does good; much depends on the weather. So far the rust has not troubled this section to any extent. I do not notice any rust in the Argenteuil asparagus. One of my neighbors has Palmetto planted, I think I noticed some rust on it. We try to get our grass in as deeply as possible. When we get the bed worked down on the roots the first year the roots are about 15 inches below the soil. Life of the plant in this section is eight to nine years, after that it loses size, and we plow it up and plant young roots again. When I select a piece of land for asparagus, usually one year before planting, I break up the land, apply about 30 one-horse loads of home-made stable manure per acre before breaking, sow two bushels of cow peas broadcast per acre, and let them grow all Summer on the land. Just before they ripen I turn the whole mass into the soil. By doing this I get my land clear of weeds and grass, and put it in fine condition for the asparagus roots. I have been using cow peas for 30 years. I am a great believer in them; they are grand for renovating land.

South Carolina. WM. C. GERATY.

EVERY FARMER CAN HAVE ICE.

At very little expense an ice house can be constructed that will hold and keep well all the ice needed for any farmer's family. We are using a small cheap



FRAME OF ICE HOUSE—ROOF BOARD. FIG. 9.

building that keeps the ice as well as one we built 20 years ago, that cost four times as much. Some farmers have an idea that they must forego this luxury, when almost any kind of a shed will preserve the ice very well, provided it is properly packed. Our present ice house is built as cheaply as possible, and took less than a day's work in construction. Fig. 9 shows the plan of the framework. We used white-oak poles set into the ground about two feet. Some cheap hard-wood bill stuff of 2x4 and 2x6 pieces were used for plates, nail ties, braces and rafters. A fair grade of pine stock boards, 12 inches wide, were used for siding. The siding was nailed on the inside of the poles, horizontally, better to resist lateral pressure from the packed ice and sawdust. A better grade of stock boards, one foot wide, furnished a good roof. Such a board roof should be made quite steep, to shed water, and, with kerfs cut on each edge, makes almost a perfect roof.

Fig. 9 shows how the kerfs are cut, one-half inch wide and three-eighths of an inch deep. The roof boards should be dressed on their upper surface, and the kerfs should be cut at least three-fourths of an inch from each edge. The mill operator sets the buzz saw out of line on the mandrell shaft just right to make a half-inch "wabble." Nail the roof boards on each edge, outside the kerfs, and drive one nail in the center of the board, as shown in Fig. 9. Our ice house cost us less than $15, and will last as long, and keep ice just as well, as one costing $100 or more.

J. H. BROWN.

THE WOOLLY APHIS ON APPLE ROOTS.

A Good Use for Tobacco.

I saw an article on the use of bisulphide of carbon in the treatment of trees and plants in your issue of September 15, 1900. I have an apple orchard of 1,000 trees, quite a pear orchard; also large peach orchard, cherries, plums, etc. A number of my trees are dying and I am unable to determine the cause. Will you describe the different stages of the work of the Woolly aphis, particularly the condition of the bark of the apple tree? What is the expense of treating trees with bisulphide of carbon, what kind of machinery or implements are used, and what is the cost of them? W. A. RUGGLES.

Tecumseh, O. T.

The Woolly aphis is quite a serious orchard pest in south Missouri and adjoining regions. It may be the cause of the trouble with the orchard mentioned. One may easily determine whether or not the aphis is at work by removing the earth from around the roots of some of the injured trees, and looking for the insects. The aphis is a small plant louse, covered with a bluish-white wool. It usually works below ground on the roots of the trees, but sometimes, especially when the soil is wet, or when it can find abundant shade, it comes above ground and sucks the sap from the trunk and limbs of the tree. If it is sufficiently abundant to injure the trees there will be no difficulty in finding many of the insects on the roots. Usually a good many of their skins, cast in moulting, may also be found close to the roots. When badly infested, the trees begin to lose vigor, do not grow with normal rapidity, have fewer leaves than usual and the foliage looks somewhat yellow and sickly, until the tree finally dies, or perhaps blows over in some windstorm. Carbon bisulphide is sometimes used as a remedy, but it is expensive, and unless used with great caution it is liable to kill the trees. If used it should be injected into the soil near the tree, where it will not come in contact with the main roots. The fumes permeate the soil and kill the insects. On account of the danger of killing the trees with bisulphide of carbon and on account of its being quite expensive, it is perhaps safer to recommend the use of finely-powdered tobacco, or tobacco dust from the tobacco factories. The earth should be removed from above the roots of the trees. the tobacco dust sprinkled thinly about them, and the earth replaced. The amount of tobacco used should depend upon the size of the tree, but a small quantity is sufficient to kill the insects. If they reappear after the tobacco has lost its strength, which may be in a year or two, more should be applied The tobacco will also injure the trees if it is applied in large quantities, and should be used sparingly. All things considered it is the best remedy for the insect that we know at this Station. Used in very small quantities, once in two or three years, it will keep the trees free from aphis and will not injure them; in fact it is a good fertilizer.

There are two other diseases of fruit trees that are prevalent in southwest Missouri, either of which may be causing this trouble. One is root rot, a fungous disease, which attacks the roots of the trees, causing them to fall over, revealing the fact that the roots have been entirely destroyed by this white, moldy-looking fungus. There is no known remedy for it, but it does not usually occur over large areas. The other is the root gall, which appears as large, wrinkled knots, at the crown of the tree or on the main branches. This root gall or crown gall is caused by a slime mold, and has been described and worked upon by Prof. Tumey, of the Arizona Experiment Station. He has found that copper sulphate and lime tend to check the disease. An account of his results may be obtained in a bulletin recently published from Tucson, Arizona. Whichever of these troubles, if either, is the cause of loss in the orchards may easily be determined by an examination of the roots of the trees. It should be remembered that the Woolly aphis also causes knots to form on the roots, but they are very small and well distributed over the root system wherever the insects are found, while the crown gall is very large, and usually occurs near the crown of the tree. J. C. WHITTEN.

Missouri Experiment Station.

OUR wheat made an immense growth last Fall, and cattle are being brought in by the thousands to graze it at 50 cents a head a month, or $5 a day for 1,000 animals. We had five good crops in succession here. A. D.

Blackwell, O. T.

HOG MANURE AND CABBAGE.

Does It Mean Club Root?

Regarding club-root in cabbage, my experience has been that the question of soil has more to do with the matter than the manure. If you have a piece of strong loamy soil, inclining to clay, with good natural drainage, you have a soil that with proper care in the details of preparation, fertilizing, etc., can be safely counted on for a good crop of late cabbage, if the right varieties are planted. But in that field there may be, here and there, places or spots that sag below the general level of the rest of the field. Now, if during the growing season of this crop there come a few downpours of rain, a large proportion of the cabbage in those spots will have "big-root," as it is called here, hog manure or no hog manure. Several years ago a prominent butcher of our neighborhood occupied a back corner of the farm we were living on at that time. Of course we had the manure. He had a trade that called for large quantities of pork; he bought cattle and pigs by the carload, the pigs worked up the offal and we drew the manure on the cabbage ground. The blood from the slaughterhouse was led to a large trough in the pigyard adjoining. Owing to this latter fact we discovered that the proportion of nitrogen was too great even for cabbage. We then began to mix it with the coarser product of the barnyard by hauling out alternate loads of each to a pile in the field where it was to be used. A couple of turnings now and then greatly improved the mechanical condition while increasing the availability of the coarse matter. If afraid to use the hog manure alone, why not adopt some modifications of this plan? I never saw any more danger from the use of hog manure than any other kind; the trouble has been that I never could get enough of it. I recall also that when I came into possession of my larger farm there had been quite a number of hogs fattened the Autumn previous, and there was a pile of about two good wagon loads of clear hog manure lying outside the pen. Besides this, we tore down the old pen that had been built on the ground about 50 years before, and it seemed at the time that everything was hog manure for about two feet down. At all events we drew out 12 good loads altogether from that old pen and applied the whole lot, with a half ton of fertilizer, to an acre of ground for late cabbage. The crop was sold in the field for considerably more than I paid for the ground. I wish we had a dozen or two of such things to clean up now; I should be willing to take the chances on "big-root" by using it.

I have heard this talk concerning the danger of using hog manure for cabbage as long as I can remember, but in every instance that has come under my personal observation it has proceeded from a class of men who always sow their cabbage seed when the "signs is in the head," and kill their pork when the moon is nearing the full, "so the meat will swell in the pot." To recapitulate: If I wished to grow a crop of late cabbage, and the ground was bare—no sod—I should draw all the coarse manure I could get, or pay for, not less than 20 loads per acre, plow it under as soon as I could in the Spring, topdress with a few loads of fine stuff and about one-half ton of good cabbage fertilizer analyzing four per cent of nitrogen, eight per cent of phosphoric acid, and 10 per cent of potash applied broadcast, then thoroughly cultivate not too deep, once a week till planting time. This on a soil naturally or artificially well drained; plant 2½ by 2½ feet; one ought to get $125 an acre from that crop. But a good crop of cabbage would not be the sole object of this thorough treatment; it is a well-known fact that there is no crop grown that is better calculated to clean up a weed-infested piece of ground than late cabbage, because to get a crop, even on well-manured ground the cultivator must be kept constantly going, and this at a season of year when showers are less frequent and weed growth less active. August is a better month to subdue weeds than June usually. But again, the next season I should like to plant that field with corn with 200 pounds of muriate of potash, and 600 pounds acid phosphate per acre, applied broadcast. I should plant it to be worked both ways, then work it all Summer perfectly level, and just before cultivating it the last way for the last time sow 10 quarts Mammoth clover of undoubted purity (not less than 97 per cent), then run the cultivator over lightly, and the year following just keep the top cut back. The next year you can grow cabbage, potatoes, or almost anything.

M. GARRAHAN.

GREEN AND DRY CORN IN THE SILO.

I have a small place, 42 acres, on which I keep 25 cows, and each Winter have had to buy hay. So, from what I have read in THE R. N.-Y. and Hoard's Dairyman, I concluded to build a silo, which I did this past Summer at a cost of $123.95, exclusive of my own work and board of carpenters. The silo is 17 feet in diameter inside, and 29 feet 4 inches high to the top of top circle. We put in four acres of corn last Spring, which I knew would not fill it, so after we mowed about the middle of June we manured five acres, plowed it and drilled in corn on July 3. When we filled the silo on September 28 to October 1, the early corn was a little drier than the farmers in this neighborhood like for their silos, but the late corn was in the milk. The teams were loaded first with a load of green and then a load of dry, and by the time it was leveled in the silo it was pretty well mixed. It has kept well with almost no sour smell and a nice green color. Would not this be a better way for farmers to do than to let the corn get too dry, and then pour water on it, as I have seen some do? Right here I would like to ask why you advocate not such heavy eared corn, but more fodder and leaves for the silage, as I saw in the Brevities of a week ago. Yours is the kind I have, as we put in the corn four to six inches in the row and rows three feet eight inches apart.

W. E. G.

Philadelphia, Pa.

R. N.-Y. We think well of that plan, though on our lower soil frost would cut such fodder about one year in five. It will often pay to plow up an old pasture or meadow abont July 1, and drill in corn. About September 1 a heavy seeding of Winter oats and Canada peas can be made. After the corn is cut off the oats and peas will give good Fall pasture. There are several reasons why we prefer a fodder variety of corn for silage. You get more leaf growth—consequently better feed—and it is less liable to sour. You get more bulk to the acre, especially in fodder corn late planted. Where silage contains a large proportion of grain the cows are likely to get too much corn in their ration.

LETTUCE GROWING IN A FORCING HOUSE. FIG. 10.

GROWING LETTUCE IN A FORCING HOUSE

Fig 10 is a good representation of some Winter lettuce taken from a photograph I made recently in one of the forcing-houses at the Michigan Agricultural College. The modern foreing-house has made it possible to enjoy vegetables the year round, and is one of the factors that have done much towards pushing gardening to the front as an industrial a t. The growth shown in Fig. 10 is very rank and thrifty, and yet perfectly tender and edible. A two-foot ru'e partly folded is shown in the foreground, which will give a fair idea of its thriftiness. The lettuce as grown in this forcing-house is first started from the seed in small flats a foot or more square. The length of germination depends largely on the sun. In ordinary weather it commonly takes in the neighborhood of three weeks or a little more before the seed, which has been sown in these flats, has produced a plant large enough for the second planting. When the lettuce plant stands from 1½ to two inches high, it is removed and transplanted into a larger flat. This time the surface is carefully checked into two-inch squares, and the plants set out. They remain in this flat until they have produced sufficient leaf and are far enough developed again to transplant into the regular forcing-house beds. Time is rather indefinite, requiring anywhere from three to five weeks. In this case more depends on the space for transplanting than on the age of the plant up to certain limits.

The beds in which the lettuce is grown are about four feet wide or less, and something between eight inches and a foot deep. The soil used is a black sand loam well mixed with good fertilizer from the barnyard. In some forcing-houses they use fully one-half compost, but I do not believe they use quite so large a proportion in these beds. The lettuce is transplanted into these beds in squares six inches apart. If the plants are very far developed a portion of the leaves is removed. This is to give the roots a better chance to secure a new foothold, and hold the foliage in check during this period. I was informed that this lettuce which is illustrated had been in the forcing beds about six weeks. Owing to less than a week's good sunshine during this time it had not developed as it ought. In taking this picture I simply located my camera on a place where lettuce has just been removed for market, and made no effort to secure an exaggerated illustration. In the foreground will be noted some coarse stems on the surface. These are tobacco fibers from a cigar factory, used in preventing insects, and do the work successfully.

Shiawassee Co., Mich. C. P. REYNOLDS.

A TALK ABOUT THE GRANGE.

What It Is; How Formed.

I notice in a recent issue of THE R. N.-Y. a question in regard to the Grange, asking whether it would be a good antidote to rumshops in country places. The official name of this farmers' organization is Patrons of Husbandry, and the different local lodges are called Subordinate Granges, which are generally four miles or more apart in New York State. Each Grange can manage its own affairs, provided it makes no by-laws in conflict with the laws of State and National Granges. Then there are Pomona or County Granges in most counties, having a large membership. The fourth degree is the great working degree of the order, and is the highest degree in Subordinate Granges. County and State Granges are fifth-degree Granges; the National Grange is a sixth-degree Grange. All fourth-degree members in good standing are eligible to the Pomona Granges. For instance, Monroe Co., N. Y., has about 3,000 fourth-degree members, of whom about 500 are enrolled in the Pomona, which elects the delegates each year to the State Grange. The local Granges are the real foundation and heart of the order, but the higher Granges are necessary to tie the order firmly together so that its influence can be thrown together, as in the case of the Grout bill and many other cases. The best way, I think, to begin in getting up a Grange where it is not understood very well is to write to Brother W. N. Giles, Skaneateles, N. Y., secretary of New York State Grange, for some copies of the declaration of purposes, constitution and by-laws of the National and State Granges, which explains all that is necessary for outsiders to know of the working of the order. Hand these to your most intelligent, progressive farmers, give them time to study up the subject, then get them to sign an application for a Grange and send it to Secretary Giles, who will see that some proper person is sent to organize it. Each Grange chooses its name, and the number of the Grange will be given by the secretary of the National Grange. In the election of officers in the Grange there is no nominating allowed, as the election is always by secret ballot, so each and every member can vote as he or she pleases without fear of offending any other member. This feature is worthy the attention of our political friends. Perhaps a few extracts from the declaration of purposes published by the National Grange will explain the objects of the Grange better than anything else.

"We shall endeavor to advance our cause by laboring to accomplish the following objects: To develop a better and higher manhood and womanhood among ourselves. To enhance the comforts and attractions of our homes, and strengthen our attachments to our pursuits. To reduce our expenses both individual and corporate. To buy less and produce more in order to make our farms self-sustaining. To diversify our crops, and crop no more than we can cultivate. To discountenance the credit system, the mortgage system, the fashion system and every other system tending to prodigality and bankruptcy. We propose meeting together, talking together, working together, buying together, selling together and in general, acting together for our mutual protection. Ours being peculiarly a farmers' institution, we cannot admit all to our ranks."

Surely, brother farmers, these are good principles of action. The cost of joining the Grange is a mere trifle compared with the benefits: $3 for men, $1 for women, 50 cents for girls from 14 to 21, and $1 for boys from 14 to 21.

S. W. COX.

Farmers' Club.

[Every query must be accompanied by the name and address of the writer to insure attention. Before asking a question, please see whether it is not answered in our advertising columns. Ask only a few questions at one time. Put questions on a separate piece of paper.]

Shredded Fodder for the Silo.

C. R. W., Ionia, N. Y.—I am trying to learn as to the comparative value of cut and shredded corn silage. I was informed several years ago by a man who had had experience in this respect that a silo would hold 20 per cent more when shredded, and stock ate it much cleaner. I would like to learn what experience the Rural family have had in this respect.

ANS.—We have neard the same statement, but have not heard personal experience. Will readers who have tried shredders tell us what they think? We usually settle such questions by opening a debate, for some one of our readers seems to have tried any variety or method we can bring up.

Forcing Rhubarb After Mushrooms.

U. F., Babylon, L. I.—We are growing mushrooms quite extensively for our limited capacity, and as fast as the beds are exhausted, or after the second cropping, they are removed and others put in their place. We have never tried forcing rhubarb, but it struck us that it would be possible to force our rhubarb in our exhausted mushroom bed. We do not find our mushrooms pay any too well at best, but after February 15 we have so far failed to discover a profit. We understand that forced rhubarb pays well if marketed in February and early March. Would you advise it?

ANS.—It seems to us that this would be just the place for rhubarb forcing. We would certainly try it. This rhubarb is a crop out of season, and customers must become used to it before they will buy it readily. After it is once introduced there is a good demand for it.

Killing Insects in Stored Grain.

F. R. L., Dunnville, Ont.—Some time ago I noticed a cure for weevil in wheat. Not thinking I would be troubled with the pest I did not task my memory with the prescription. To-day I noticed on the top of my bins of wheat that it was heating, and a crust forming on top. On examination I found the wheat quite hot, and a very small and lively insect working in it. What shall I do to stop the pest from working?

ANS.—The best way to kill these insects is to use bisulphide of carbon. This liquid quickly exhales a deadly gas, which is heavier than air and sinks down through the grain. Put the bisulphide in a deep dish at the top of the grain. Close the bin and make it as nearly airtight as possible by throwing blankets or bags over the top. The liquid will evaporate and the gas will work down through the grain. The gas is deadly, and very quick to take fire. Do not breathe close to the dish, or bring any light near it.

Muskmelons for Cow Food.

Reader.—I have read a recent article in which the following statements are made:

"Last year the valley of the Arkansas was literally covered with cantaloupes, and thousands of them would have rotted had the raisers attempted to gather them for the markets with the small number of men who could be employed to work. As a result of the shortage of men, the farmers fed the cantaloupes to the cattle and were surprised to see them fatten at once, and, besides, present the milkmaid with a quality of milk that was next to the nectar famed in olden times."

The writer goes on to say that this "discovery" is likely to make Colorado a great Summer cattle-feeding State, as the melons will take the place of corn. Is there any sense in it?

ANS.—The raising of cantaloupes for stock feed would never be profitable. They are a difficult and expensive crop belonging to intensive farming. The land must be very rich, just heavy enough, and so thoroughly underdrained by Nature that no water will stand around or beneath the roots. The vines must be carefully and frequently irrigated, and the whole field cultivated and hoed so as to keep it entirely free from weeds. All this is expensive. It cannot be counted as less than $35 an acre for the mere raising of the crop. The feeding value of cantaloupes is not high when figured per ton, on account of the large amount of water they contain. Pound for pound, there is not much difference between the feeding values of cantaloupes and mangels, while the crop of mangels is very much larger. A crop of four tons of cantaloupes per acre is a pretty large crop. While it is true that quite a number of tons of cantaloupes are fed to stock in the Arkansas valley of Colorado, it is merely the overgrown ones or the overripe ones. They cut no figure in the stock feeding of the country, and it would be difficult to figure any profit from their use, even considering them as a waste product. If they are to be used as feed they give a little better returns when fed to pigs, which are very fond of them. WELLS W. COOKE.

State College, Pa.

For Catarrh and Chilblains.

E. S. B., Harwinton, Conn.—Could you repeat the directions you gave some time ago for the treatment of catarrh? I know bicarbonate of soda was one thing used. Also, can you, or any of your readers, tell of any cure for chilblains?

ANS.—Dry bicarbonate of soda is used as a snuff, and the inside of the nostrils are kept well smeared with vaseline. The bicarbonate or cooking soda will "cut" or loosen the mucus so that it can easily be blown out. Snuff it up—as far back into the nose as possible. We have found this much better than salt water or other home-mixed liquids. The vaseline prevents the annoying dryness of the nose, and is a great relief in any place where dust abounds. This is not given as a "cure" for well-established cases of catarrh, but it will give relief in light cases, and will not injure the nose.

The annoying condition known as chilblains is usually the result of pressure and cold combined. The capillary blood vessels in the upper surfaces of the toes and other portions of the foot become permanently enlarged and congested, and the nerve terminals grow highly sensitive to alterations of atmospheric pressure and temperature. The distressing burning and itching pains of chilblains are well-known to be especially severe when the barometer is falling before a storm, as the congestion always increases as the atmospheric pressure lessens. There is no real cure, in the popular sense of the word, but the affected parts gradually regain their accustomed tone when cold weather passes. Every effort should be made to relieve local pressure on the congested parts, and to keep the feet warm and dry, trusting mainly to time to restore the former condition of the circulation. Frequent baths with strong salt or alum solutions tend to hasten the contraction of the capillaries. Applications of resinol ointment, which may be had at any good drug store, will do much to relieve the burning pains, and is about the only drug having much effect. It is perfectly safe.

Cover Crops and Cultivation in Peach Orchards

E. C. R., Batesburg, S. C.—What is the object of having a cover crop, such as peas or vetch, in a peach orchard during Winter? Is there any objection to plowing in acid rock and potash in the peach orchard during the months of November and December? What is the best means of keeping peach trees from blooming so early that the fruit is killed by frost? When trees have bloomed and frost is predicted, how can the fruit be protected against the frost? How soon should plowing be done in the orchard in the Spring, and would this plowing have any effect as regards frost?

ANS.—The main objects to be gained by growing cover crops in Fall, Winter and early Spring in peach and other orchards, and in fact, on any idle ground is, to take up the nitrogen of the soil that might otherwise be lost by evaporation or drainage, and to furnish humus for the lightening of the soil. They also help to hold the soil from washing, and retain snow longer than if they were not there. Peas and vetch also take nitrogen from the air, and this is so much clear gain. Rye and oats will not do this, hence the advantage of the two former crops. The Fall and Winter is a very good time to plow under potash and phosphoric acid in their various chemical forms. There is a decided advantage in Fall as against Spring application of manures containing potash and phosphoric acid; because they have more time to dissolve and become available plant food. There are many mistakes made by those who apply them without fully understanding this point, and much disappointment as the result of little or no benefits to the crops planted at the time of planting them, or soon after.

Spraying peach trees with common whitewash has been found to have a retarding influence on their blooming by reducing the absorption of heat from the sun, because of the white color repelling the power of sun's rays to a greater extent than the natural color of the twigs and buds. There has been found to be a difference of a week in date of blooming, in some experiments, between sprayed and unsprayed trees in the same orchard rows. It is not possible to hold back the bloom by covering the tree roots with any kind of mulch, although some persons have expressed that belief. The temperature of the air may and will cause the flower buds to develop when the roots are in ice, as has been done with grapevines, roses, etc., where they were standing near a greenhouse into which their tops were extended through openings purposely made. I have seen this done. Saving fruit crops from frost when in bloom is a very difficult and often an expensive or impossible thing to do. Fires are sometimes made at such times, by keeping ready for lighting heaps of logs and brush in the orchard. Burning straw has also been tried with some effect. The outside atmosphere is very difficult to change in temperature by such artificial means as we may have at command. Plowing should be begun in Spring, at the first start of vegetation of the trees. The philosophy of tillage should be well fixed in the mind to be for the purpose of conserving the water in the soil below the surface. The more nearly complete we make and keep the surface in a state of dust the moister will be the lower stratum. I do not believe that the state of tilth would have much effect upon the blooming time of the trees or the prevention of frost effects.

EVERY FRUIT GROWER SHOULD READ R. M. KELLOGG'S NEW BOOK, ENTITLED

GREAT CROPS OF SMALL FRUIT

AND HOW TO GROW THEM. The author has grown the largest crops of fancy fruit ever produced on an acre. In his experimental grounds are single plants which yield over FOUR QUARTS each of fine large berries. His customers have done as well. This has been accomplished by SCIENTIFICALLY BREEDING up plants to a high fruiting vigor so they throw their energies to the development of fruit instead of useless runners. The profit comes from a big crop of big berries that sells at sight to regular customers. This book tells you all about how it is done. THE CHEAPEST PLANT is the one that will give you the best fruit and most of it. You can't afford to play second fiddle on the market by using scrub plants. The only stock of scientifically-grown thoroughbred plants in the country for Spring planting. Send your address at once, and get a copy of this book, and a revised edition for three years FREE. R. M. KELLOGG, Three Rivers, Mich.

NORTHERN CATTLE FOR THE GULF STATES.

Dangers from Texas Fever.

We have a reader in Michigan who wishes to take a herd of Holsteins into one of the Gulf States. He asks us whether it would do to take these cattle to Texas, Mississippi or southern Illinois, and at what season of the year would it be best to go south. There has been a feeling among northern stockmen that it is not safe to take full-grown cattle into the Gulf States, since a large proportion of them die from Texas fever. The recent investigations regarding this disease, however, seem to show that there is not so much danger now as formerly, and we would like very much indeed to know for the benefit of this man and others like him just how much risk a man will take by carrying a herd of Holsteins into the Gulf States. What precautions would you take, when would you go, and would you prefer to take young animals, and not attempt to carry the older ones?

ANS.—Until recently the man who shipped cattle into the Gulf States from portions of Tennessee or from States north of Tennessee, ran the risk of losing from 30 to 80 per cent of his herd, according to the age of the animals. After many failures the veterinarians of this country and of Australia have found means of reducing the loss from Texas fever to an insignificant percentage. The most approved method consists in inoculating the northern animal, either in its original home, or after arrival in the South, with the fresh blood of a southern animal that is infested with ticks, or has recently been so infested. The blood is drawn from the jugular vein of the southern heifer, the skin, instruments, etc., being first sterilized. It is caught in a bottle or other vessel which can be kept stopped with sterile cotton, and in this vessel the blood is beaten with a sterilized glass rod, or other beater, until the fibrin clots can be removed with the rod. Then from one to two cubic centimeters of this defibrinated blood are injected by means of a hyperdermic needle, into the shoulder of the northern animal. The result is a mild form of Texas fever. To make the immunity more certain or intense, another inoculation is made several weeks after all signs of the first fever have disappeared. With detailed directions, which will doubtless be cheerfully furnished by the veterinarians, who have worked on this matter, any physician familiar with the usual means of keeping his instruments sterile, or any very intelligent and careful farmer will be able to do this work. In some cases the veterinarian of a southern experiment station offers to make the inoculations, and the time is doubtless near at hand when simple and detailed directions will be available for all in the form of a bulletin. The stations that have published results of acclimating cattle are those of Missouri, Texas, Mississippi, Louisiana, Arkansas and Alabama. This inoculaletin. The stations that have published either in the North or in the South. If done in a cool climate it may begin in late Summer. In the South inoculation is best begun in late Fall or early Winter. Special care as to food and shelter are necessary during the prevalence of the fever induced by inoculation. Indeed, this special care should continue throughout all the following Summer.

The above outlines the best means of treating cattle to prevent serious losses from Texas fever. The method has given most gratifying results with animals under 18 months old; and in the few published instances where it was used on mature cattle, the results were also satisfactory. However, there is doubtless more risk in inoculating mature animals or pregnant cows than in the case of young animals. In cases where this inoculation seems impracticable, other less certain means of avoiding loss from Texas fever may be pursued. For instance, the calf or yearling, after arrival in the South, preferably in November or December, may be inoculated by placing 25 to 50 ticks on it. Or, in cases where there is no expectation of introducing southern animals into the "imported" herd, or of selling animals from the herd in the South, Texas fever can be permanently kept out of the herd by eliminating the ticks on the cattle and on the entire farm. In this latitude the cold of Winter is sufficient to free a pasture of ticks, making it safe for northern cattle, provided no infested cattle run on it and reinfest it after cold weather is past. From pastures intended for this purpose, southern cattle should be fenced out after January. Possibly near the coast the cold may be insufficient in some Winters to free the pastures of ticks. When pursuing this system the few ticks that may accidentally find lodgment on the cattle may be removed before they have done any harm, by the use of a mixture of kerosene and oil or lard. It is more convenient and in every way more practicable to immunize northern-bred cattle by gradually inoculating them, either with defibrinated blood or with a few ticks, than to attempt the task of entirely excluding the tick. In the herds under the writer's care we aim to prevent excessive tick infestation, but would not willingly exterminate them all so long as there are any ticks on any southern farms with which we may exchange cattle. Young animals can be acclimated in the South with much greater ease than can mature cattle. Yet the few published records of the successful inoculation of mature cattle lead us to believe that the man who has a valuable herd of mature cattle can afford to bring them South rather than sacrifice them, and that he has reasonable grounds for expecting that most of them, if arriving in November or December, or even in January, and if treated as suggested above will survive even though during their first year they fail to make their usual record in milk production.

J. F. DUGGAR.

Alabama Exp. Station.

"Six Good Red Winter Apples."

E. L. P., East Paris, Mich.—I am about to set an apple orchard on heavy clay loam, and am still undecided as to what varieties would be most suitable for my location. Please name about six varieties of good-keeping, red, Winter apples, barring Baldwin and Northern Spy. My objections to the two latter varieties are, that there are now too many Baldwins set, and in addition to this the tree is defective; the Northern Spy is too long in coming into bearing. Can you tell me anything about the Ox Noble?

ANS.—So far as I know there are not so many as "six good keeping, red, Winter apples" suitable to the climate of Michigan among all those catalogued, and especially is this so if we leave out Baldwin and Northern Spy, which it may be well to do. These latter varieties do have the objections mentioned. Wagener is a very good Winter apple for Michigan, having high color, good size and fine quality; but the tree is deficient in the root. If Northern Spy trees were planted and then budded or grafted in the branches to Wagener it would be much better; for the former is a very good tree for a stock. However, the Wagener sometimes makes good trees without this trouble, as I know by experience and observation. Within the last month I have been over a part of Michigan, and saw a beautiful and healthy orchard of Wagener in Benzie County, which is more than 100 miles north of where the questioner lives. There is no valuable variety which will bear earlier and more abundantly than Wagener. Sutton has been tested but little in Michigan, but it does very well in New York and Massachusetts, where the Baldwin has long been a favorite, and is now one of its competitors. It would be wise to plant a row or so of this variety. Red Canada is a well-tested kind of very good color and quality and fair size, but it is not so free a bearer as we would wish it was. However, it is a good kind for general purposes. Jonathan is exceedingly brilliant red and of high quality, but the fruit is rather small. Rome Beauty has been considered worthy of trial in the Baldwin country and may prove very desirable there, as it has shown such signs. "Ox Noble" I do not know.

H. E. VAN DEMAN.

PLAIN TALKS ON PLAIN TOPICS.

National Investments for Agriculture.

You do not seem to favor the National bill granting subsidies to American ships.

You are right about that.

Why?

We oppose the principle of taxing all the people to help a small body of shipbuilders who are better able to take care of themselves than most other business men.

You are not consistent; for farmers have more special privileges to-day than any other class of people.

How do you make that out?

Look at the immense sums of money spent to educate and instruct the farmer. We have to pay for it all, but no business man asks the Government to pay for his education.

The entire yearly cost of the Agricultural Department is $3,500,000. This subsidy bill provides for $9,000,000 to be given to a single industry. The tariff on half a dozen articles we could mention puts five times the cost of the Agricultural Department into the pockets of a few manufacturers.

But the principle is wrong anyway.

No, because all are benefited by the money spent for agriculture.

Who do you expect is going to believe that?

You will when you understand about it. About 70 per cent of our export trade is in farm products. The farmers of America are paying principal and interest of our foreign debt, and building up a surplus abroad.

What has that to do with it?

The Agricultural Department is constantly increasing this trade. Its agents search the foreign markets, advertise our goods and introduce them. Their work with corn and apples alone has added millions to our export trade. If your subsidy bill would increase foreign trade or reduce freight rates it would be worth talking about, but who claims that it will?

But what about the money spent for farm colleges, stations, etc.? How does that help all the people?

By making food cheaper and better. The wise spending of this money has developed a small class of pure scientists and a very large class of intelligent farmers who combine science with practice. The scientists have given the world new varieties of fruits, vegetables and grains, and have discovered new principles of directing plant and animal life, and new methods of handling the soil. The practical men have utilized this knowledge so well that there never was a time before in the history of the world when a nation was so well fed and clothed as are Americans of the present day. Money spent to encourage shipbuilding benefits a few ship-builders and a few more workmen and iron workers. Money spent to encourage agriculture benefits every person who eats or wears clothes. One plan takes an average of 75 cents from every man who voted at the last election and stuffs it into a few fat pockets. The other takes about 25 cents and will, in time, pay it back one hundredfold in the ability to buy better and cheaper food. The money spent for the Agricultural Department is an investment. It is the only true investment Uncle Sam makes.

Ruralisms

NOTES FROM THE RURAL GROUNDS.

GREENHOUSE EXPERIENCE.—Early in 1894 it became necessary to build a small greenhouse on the new Rural Grounds, then being arranged for experimental purposes. We found a space 16 feet by 24 feet at the southern side of the dwelling house, built on the highest point of the plot, the only location available without going to the level at the foot of the slope, several hundred feet away. It is not a good idea in general to attach a greenhouse for the propagation and development of plants to a dwelling, on account of the disagreeable necessity for using such insecticides as tobacco or the dangerous fumes from carbon bisulphide and hydrocyanic gas, but there was little choice in this case. A conservatory, in which plants developed in other buildings are exhibited during their period of perfection, is not open to the same objections. The problem was to get the most utility out of the space and conditions at our disposal and, though the writer was not without experience in commercial glasshouse work, he found it a rather complicated one. The years that have passed since the structure was erected have developed its defects and advantages and, as the construction of small and economical greenhouses is far from being on a settled basis, it may be of interest to sum up conclusions as to its main features. The plan adopted was the ordinary three-quarter span, with the long slope to the south. It is usually advised to run houses of this character due east and west, in order to secure the greatest amount of sunlight, but the position of the dwelling necessitated a range 30 degrees north of east and south of west. This turns out to be an ideal aspect for the latitude of New York, as the benches are flooded with sunlight all day when the sun is at its lowest declination in midwinter, but as the days grow longer more and more shade is cast by the house on the north until in midsummer the northern benches are shaded by 2 P. M. This is a great advantage in carrying over plants sensitive to glaring sunlight, as it obviates the need of shading the glass during Summer, always an unsightly procedure. If building again we would adopt this aspect if at all possible, but its advantages would not be so marked without the tall dwelling on the north. The design of the house, and all the essential woodwork for the same, were furnished by a western firm making a specialty of greenhouse construction, good southern cypress being used. This is by far the most satisfactory way of getting the material, as local mills and carpenters, even if really expert in house-building invariably make a botch of greenhouse or conservatory work, and the usual result is a cumbrous, dark and in many cases short-lived structure. It is not generally known that commercial glasshouse owners either build themselves by supervising unskilled labor, or contract with regular construction firms rather than employ carpenters. In our case the material being all worked out at the factory the actual erection was a simple matter.

It was deemed essential in planning an experimental greenhouse for the purpose of breeding plants to secure the highest possible percentage of light, and glass 16 inches wide was selected and butted together, a special sash-bar and cap being used for the purpose, entirely dispensing with the need of putty. This is a very simple and rapid way of glazing a house, but necessitates the use of the highest grade of glass, as the cheaper qualities are not cut with sufficient accuracy to make close joints. We like the plan in every way, although it has not grown in favor lately. Rather than pay the high price now demanded for first-quality glass we would use a cheaper grade and put it in by the usual lap system. In 1894 glass could be bought for less than half the price now demanded by the trust. According to advice received at the time we laid the glass on the bare sash bars, and covered with the cap, screwing down at every pane. While this made an admirably light and dry roof the wind, during southern gales, would find its way around the edges of the glass in considerable volume. To prevent this we have since placed a strip of candlewick, soaked in linseed oil, under the caps at each edge of the glass. On screwing the cap in place the oil is forced into all slight vacancies, where it hardens, thus making an airtight and waterproof joint. This plan is quite generally adopted now, when the glass is first laid. We decided to use the hot-water system for heating and see no reason to regret it. The water first goes through the dwelling, and returns under the greenhouse benches. Against the advice of the contractor who put in the plant, we insisted on using two-inch pipes, one line of six pipes being required under the front bench. This works well, but we are now inclined to think three four-inch pipes instead would give out a more uniform heat, and prove more durable. On the whole, this little glasshouse has given great satisfaction, and very slight changes would be made in case a need for rebuilding should occur.

A LONG WAIT.—Eight years ago some crosses were made between the familiar Paper White forcing variety of Polyanthus Narcissus and the large Chinese form sold as Joss flower or Chinese Sacred lily, which is also a variety of the same species, Narcissus Tazetta. The resulting bulblets have been since growing either in frames or pots, and two have now developed good blooms. The flowers are large and closely resemble Paper White in purity of color and general make-up, while the foliage and vigorous manner of growth approaches the Joss flower. Just what these hybrids will develop into when the bulbs reach full strength is a question that time alone will show, but the outlook is quite promising. The slow growth of Narcissus seedlings is trying to an impatient gardener, as the increase in size and strength of the seedling for several years is very trifling. There is a great renewal of interest in these sweet and graceful flowers abroad, and some of the newer hybrids have sold for remarkable prices. The Joss flower is a very strong-growing variety of the Polyanthus Narcissus which the Chinese claim to have cultivated from the most remote times for the decoration of their temples or joss houses, and their own dwellings. They always try to bring them into bloom at the opening of their new year, in our month of February. It is not known to the Holland bulb trade, which practically disseminates all other varieties of the Narcissus. It has become very familiar here of late years, and almost everyone knows how to bloom the immense imported bulbs in bowls or water containing enough pebbles to stay the roots. As a matter of course the Joss flower grows and blooms better in soil than in water, just as any other bulb or plant, for the reason that the roots are enabled to draw nourishment as well as moisture from the soil, and sustain the growth in a natural manner. The color of the bloom is generally white or pale yellow, with a yellow cup. The new hybrids are pure white.

ARRANGEMENTS are being made for the shipment of mangoes and other tropical fruits from Bombay to Great Britain. They will be taken in cold storage by some of the steamers now engaged in the Australian butter and meat trade, and a good market seems assured.

Propagating Hardy Climbing Roses.

How shall I propagate Prairie Queen and Crimson Rambler roses? I have tried to root layers, but failed, and have taken some hard-wood cuttings, which I have bedded in sand in the cellar. How can I root them? READER.

Roses of the type of the varieties named do not readily form layers, or root from hard cuttings grown in the open air. If the layers are well nicked on the lower side of the bend, and buried deeply in moist soil, which is to be firmly packed, they will often root by the end of second Summer, if not before. Hardy climbing roses are often budded on Manetti and wild briar stocks, and occasionally grafted on the same. Budding is done in the same manner as with peach and other fruit trees, in August or early September, the bud remaining dormant until the next Spring. By far the greater number of roses are propagated from cuttings of young wood grown under glass and rooted in pure sand in a propagating house kept at an average of 65 degrees. The sand is packed very firmly about the cuttings, and kept quite moist. The above varieties of roses root very readily under such conditions. The hard cuttings you have now had better be buried upside down in the earth outside, covering with six or eight inches of clean sand, if procurable. In the Spring plant them in a trench, packing the soil firmly about the bases. Leave only one or two buds above ground. Hard rose-cuttings are sometimes rooted in a mild hotbed, but this method is very uncertain in inexperienced hands.

About three years ago you sent me a root of the Carman grape; it had a fine crop this year. To my mind it is a superior grape. The first time it bore (a year ago) I was very much disappointed in the fruit, and had a mind to dig it up; now I would not part with it. H. C. D.

Ohio.

SEVERAL years ago the Hessian fly got in our wheat in the Fall so badly that it nearly ruined the crop. One man saved his wheat by turning his sheep in his wheat in the Spring. He got rid of the fly, and had a big crop of wheat, but considerably later than it otherwise would have been. Another man told me he killed the fly on a sandy knoll by a heavy application of salt.

HOPE FARM NOTES.

Letters and questions have come rushing in upon us lately. They come from all parts of the country, and we may as well take some of them this week for discussion.

SWEET CORN STALKS.—A market gardener in Connecticut asks this question:

Which is the more economical way to get rid of green cornstalks, to plow them under or sell them for $5 an acre standing? We raise sweet corn for market, and do not keep stock enough to use them.

As between plowing such stalks under and selling them at $5 per acre I would sell. It is hard to plow them under right. The whole stalks do not leave the ground in good condition for gardening crops. We should want to have some other crop, like clover, rye or oats, growing in the corn before the ears were fit to pick. I am very sure that I can buy with $5 in cash more available fertility in chemicals than the stalks on an acre will furnish. I would not sell the stalks, however, but would feed them to hogs. A good pen full of hogs will prove very useful on a garden-farm. They will make pork out of wastes that would otherwise be wastes indeed. I would cut these stalks and throw them whole to the hogs. They will do the rest.

GATHERING LEAVES.—I had no idea that so many of our readers gather leaves for bedding. All seem to agree that they make good bedding and manure, and that a chestnut tree may well provide fertility for a hill of corn. The difference of opinion comes when they come to pick the leaves up. Here is the way they do it in Alabama:

Rip the seams of a large bran or burlap sack. Get two broom handles or other sticks as long as the piece of burlap is wide, tack securely to ends of burlap. Rake leaves in piles with rake. Grasp the loader (described above) one stick in each hand, envelop the pile of leaves bringing the sticks together under the leaves. You will have as many leaves as you want to lift at one time, and they are easily dumped into large wagon rack. This may be too late for H. W. C. and others in the Northern States to use this Winter, but they can remember and use it next year, and your southern readers can use it almost any time during the Winter.

Thorsby, Ala. P. C. S.

We are having a very open Winter and can still pick up leaves. The Alabama plan ought to work, but an Ohio man seems to think he can beat it. This is the way:

On page 351 is an interesting account of how to handle leaves, but I am sure I can go it one better. If you have leaves or any other fine stuff of that kind to handle that does not work well with a fork, procure some of the common wire chicken netting of two or three-inch mesh, and take a piece about 12 to 15 feet long and from three to four feet in width. Lay this flat on the ground and rake your leaves on to it, then commence to roll, and, presto, change! Instead of a loose lot of unmanageable stuff you have a nice compact bale that by a few turns of the loose ends of the wire may be secured, loaded into the sled or wagon, or carried in any shape. There is much material on the farm that would make good bedding for stock if it were not so difficult to handle. Clover haulm is one of these. To handle it is much like eating your soup with a fork, but with a sleve of wire netting it can be handled easily. I have been feeding cornstalks without cutting, and to get them out after being picked over by the stock is not an easy job, but with a piece of netting I can carry all of it quickly. I do not think any one will fuss to crowd leaves into a bag, when they can be nicely baled, by simply raking them on a piece of wire netting.

E. C. GREEN.

It strikes me that Mr. Green does the thing right up brown! No use talking—it pays to bunch things up if you expect to utilize them properly.

COVER CROPS.—A farmer in Missouri wants to know why we have so much to say about "cover" crops. Here is his letter:

I notice that what is called a cover crop has become a fad with a great many of THE R. N.-Y. people. What I want to know is what crop will it benefit, and how and why, as I know from experience that it is a positive injury to a wheat crop. If wheat ground can be plowed by July 1 and left to lie bare in the hot sun until seeding time it will produce more wheat per acre than any other way. W. A. COWAN.

When I speak of a "cover" crop I mean clover, rye, oats, rape or some similar crop which grows through the late Fall and Winter and covers the ground. Most of our money crops grow between frost and frost. They are planted after the ground warms in the Spring, and are killed by the first hard frost. We use manure or fertilizer freely, and after frost kills these Summer plants the soil still contains soluble plant food left by the corn or potatoes. We reason that if the soil is left bare this soluble plant food—or at least the nitrogen—will be washed and leached out by the soil and lost to us. On the other hand, if we have some live crop growing through the Fall and Winter, it will utilize and save this plant food. You might throw swill from the kitchen right into the brook—and lose it. You might, on the other hand, build a pen by the side of the brook, put a hog in it, and pour the swill into his trough. We think the cover crop represents the hog in the pen. Another use for the cover crop is adding humus or vegetable matter to the soil. Some of the most profitable farm lands in the East are light and sandy. They are quick and warm, and early crops can be forced rapidly. Fertilizers are used largely and "cover" or green crops, grown between money crops, supply the humus which elsewhere may be supplied in stable manure Again, such crops as clover, cow peas, Soy beans, etc., catch and save nitrogen for us. The plan you speak of is advocated by Mr. Clark, the grass man. This "Summer fallow" gives best results on heavy, black lands where there is plenty of humus. Except when we wish to prepare land for grass seeding there are few places in Hope Farm where it would pay. With us your wheat would be a "cover" crop, but we would raise a crop of early sweet corn or potatoes instead of working the ground.

COW-PEA VALUES.—Another reader in Missouri says he has caught the cow-pea fever:

I have raised the Whippoorwill pea; with me, horses, cattle, hogs and chickens eat them. I had six acres this year; we picked off most of the pods and now the horses spend three-fourths of their time on the patch, and they will feed there as long as there is a peavine they can find. Some have sown them in corn the last plowing, then in the Fall turn the cows in on them. They say there is nothing that will make more and better butter than a patch of such feed.

That is just what others say who have used them for pasture. I seldom feed them down, but plow the whole mass right under. One reason for this is that we are using cow peas on the far-back fields, where it would not be possible for us to turn the stock. We want short hauls for the manure and fertilizer and cow peas for the distant fields. Perhaps we make a mistake when we fail to utilize every feature of the cow pea. Sometimes a man is satisfied to look at one side of a thing, and make no effort to learn about dozens of other sides which other farmers have been forced to learn about. I thought of this last week in watching the children play with one of their Christmas gifts. It was a painted box with seven other smaller boxes fitting into it. They could be taken out and piled one above the other. I was curious enough to measure them. When all were packed in the larger box 56 square inches of surface were presented. When piled one above the other all the boxes gave 268 inches of surface! When only the larger box was used with the others inside, 212 inches of surface were hidden. It is the same way with some men. They narrow a good thing down to a single view, and thus lose the best share of it. Others crowd their powers into the smallest compass and never try to expand.

SAWING WOOD.—Another good friend, who may have a wife who makes dry remarks about green fuel sends this note:

Know ye of any place I can buy a jig saw with frame heavy enough to saw wood on for the stove? It is strange to me if the inventors have not applied the crank in some form at the wood pile. It is a good place for a crank, for a bucksaw is a little too much for the backbone of these present times. It is a good thing to get the prophet's wheels out of the head or the heavens into a man's hands, or under his feet, whether the prophet meant it to be so or not. If he lived to-day and had to saw wood for a stove, he would have separated the wheels from the wings and put them to use.

We think the folding sawing machine advertised in THE R. N.-Y. would eat up that wood pile. It will need a balanced ration of fat on the saw and muscle on the handle. One trouble with the modern backbone is that it wants to be saved by the head. The inventors seem to have neglected the hand saw for much the same reason that they have let the old grain cradle nurse itself alone. Wood sawing is now done by steam or horse-power. I have bought a circular table saw. I expected to use a horse-power to run it, but now hope to hire a portable steam engine for a few days, and get the job done in a hurry. I have known good men, who were accused of having "wheels in the head," but these "wheels" often turned into wings to float them nearer their duty or away from it. The man who can settle the fuel problem without any jar to the family wheels is worthy of wings.

WOMAN'S WORK.—The Madame recently found an article in a newspaper which tells of a Pennsylvania woman who baked 8,303 pies in one year. Her husband, seven sons and a hired man ate these pies—and lived to brag about it. Here is the pith of the story:

"Who ate the pies? Why, we home folks, of course. I'm good for three a day, and I hope I haven't raised a son who can't do as well as the old man. Then I have a hired man who, I'm sorry to say, can beat even me. Why, that fellow will eat six pies a day and get fat on 'em. Never had a hired man about the place who couldn't eat pies. The last man I had said he had stomach trouble and wouldn't touch the nicest tart Mary could bake. He disappeared one night with my best colt and I haven't seen him since."

Now you don't catch me printing my opinion about people who have been mastered by the pie-eating habit. I'm too old a bird to stir up anybody who holds advanced and pronounced opinions on religion, politics or pie-eating. Let us have peace! So long as the women folks are content to go through life bearing a pie-plated chain, the Hope Farmers will continue to hope for better things and say nothing. I don't believe our people ate 60 pies all through 1900. We like puddings better. As old readers know, Aunt Jennie kept an accurate account of certain kitchen statistics last April. I will repeat her figures:

HOPE FARM KITCHEN STATISTICS.
For the month of April, 1900.

Number of eggs cooked	269
" " potatoes eaten	603
" " biscuits baked	209
" " puddings baked	15
" " cakes baked	6
Knives and forks washed	1,218
Spoons washed	1,250
Dishes washed	3,182

Now my purpose in bringing this up once more is to point out to the men folks what an endless job dish-washing is. Just watch some big, fine-looking farmer after supper some night. His day's work is about over. He settles into his soft chair with a sigh of relief, but Mother and the girls bring out their everlasting dish-pan and proceed to give the dishes their evening bath. It seems like a small job, but if you put enough small jobs together you will make an avalanche. I have spent some little time figuring on our dishes. Taking the average area of cup, saucer and plate I find that our women folks washed and wiped over 267,288 square inches of crockery during April. There were 19,758 inches of spoon and fork, which makes 287,046 inches all told. Counting two children for each adult we find that the daily wash and wipe for each adult was 1,290 square inches. For the entire Hope Farm family during 365 days the dirty dish area reaches the fearful total of 5,179,350 square inches. Washing and wiping thoroughly means four times over or a total surface of 20,717,400 square inches! Remember that there are 6,272,640 square inches in an acre! Now then, Friend Farmer, if a part of your stent for 1901 consisted in cleaning over three acres of crockery and metal wouldn't you quit the job early, leave a good share of it dirty, or else provide yourself with the best possible conveniences for doing the work? It's early in the new year now—so let's have the truth from you! No doubt some men will say—mentally if not audibly—"why that's woman's work and women are inferior to men anyway!" Yet these same men may know full well that when the great Judge of duty comes along they will be passed if at all, on their wife's ticket! H. W. C.

Remittances may be made in money order, express order, personal check or bank draft.

THE RURAL NEW-YORKER,
409 Pearl Street, New York.

SATURDAY, JANUARY 12, 1901.

WE are glad to give this week a clear and simple statement of the principles and machinery of the Grange. We hope to follow it with other articles showing what the Grange has actually done for individuals and communities. Other organizations of farmers come and go, but the Grange lives and grows steadily and hopefully. We recommended a live Grange as a good antidote for a country rumshop. It is that, and a remedy for many other ills also.

*

TRANSCONTINENTAL railroads are said to be backing the general irrigation movement outlined at the recent irrigation congress in Chicago. They will unite in efforts to have the arid lands in Arizona, Nevada, New Mexico and other States west of the Mississippi transformed into fertility with the aid of Uncle Sam's pocketbook. It may be, of course, merely a spirit of altruistic patriotism which causes the railways to take up this plan; still, another western boom would mean millions of revenue for the transportation lines. Why not, with equal justice, start a movement for Government aid in reclaiming abandoned New England farms?

*

GOVERNOR Odell, of New York, says that some of the public officers of New York City receive more money for their services than is given to President McKinley. For example, the sheriff of New York County is paid a salary of $20,000 per year, and one-half of certain fees, which amount to $60,000. Other officers also receive vast sums—chiefly through the fee system. This same robbery of the people is carried on by smaller public officials, and the time has come to put an end to it. No business man would permit his clerks to make an income in this way, and the State, county or town should be run on strict business principles. The fee system should go.

*

READ what the commission men say (next page) about the box for apples. Does it not seem ridiculous for a grown-up man to say that such boxes would "lessen the consumption"? Have the small, neat packages of oatmeal and other prepared foods "lessened their consumption"? No—trade has been doubled. City people have no storage place for barrel lots. The statement that the small package will prevent deception is true. You may face two ends of a barrel, but it will be hard to face six sides of the box, as would be necessary in packing three bushels of apples. Join the ranks of the "boxers" so that your finest fruit will have a better chance to show itself.

*

AT the Watertown meeting of the New York State Dairymen's Association a working committee was appointed. The work in mind was that of raising the funds needed to send a good delegation to Washington in the interests of the Grout bill. This committee did not stop to play but got down to work at once. By January 1 they raised $139.64, and the society will be well represented at Washington. Not only this, but the committee has stirred up renewed interest and energy among the dairymen of the State. More money is needed—quarters to meet the $5 bills of the oleo people. Remittances may safely be sent to W. H. Peck, Syracuse, N. Y. Mr. Peck should be supplied with a bushel of money for work in this good cause. Can the dairyman's quarter hope to compete with the $5 bill of the oleoist? Yes, if two cents are added for postage on a strong personal letter to the dairyman's Senator! One of the strongest points made by the honest butter people is the fact that the oleo men have no public sentiment back of them. They are only a few rich men fighting for money which is not rightly their own. Men will fight to preserve the sanctity of a home but not to uphold a cheap boarding house. Farmers will fight for their trade sister, the cow, but the town voter has little love for his distant cousins, the hog and steer—even with their yellow paint on. Senator Chauncey M. Depew, of New York, knows this, and it is one reason why you should load him down with letters well colored with honest butter.

*

A BOSTON cold-storage company recently discovered that a quantity of eggs in its storage chambers had acquired a foreign flavor suggestive of fruit, which would affect their value. About 40,000 cases of eggs were stored in the chambers, but they were not all affected. The storage company believes that the change in flavor was due to fruit stored in an adjoining chamber; yet a brick wall varying in width from 16 to 24 inches separated the egg chamber from other apartments. We believe that small producers or holders of eggs often overlook the fact that foreign flavors or odors are so readily absorbed. It is certainly an error to store eggs in a cellar or pantry where fruit, cheese, and other articles of food are kept. It is likely that complaints concerning the flavor of fresh eggs, on the part of private customers, often result from carelessness in this respect.

*

THE writer well remembers the time when it was a great business risk to attempt to take cattle from the North to the Gulf States. Younger animals sometimes lived, but older ones were sure to suffer from Texas fever, and most of them died. There were many southern breeders who were anxious to improve their herds by importing the best blood that could be obtained, but the severe losses discouraged them. The connection between this fever and the cattle tick has now been worked out, and it is possible to bring cattle from the North with a good chance of success. These cattle are inoculated with the blood from southern cattle, or even with the blood of the cattle tick, and are thus made immune to the disease. This is but one of hundreds of things for which farmers are indebted to the patient work of the scientific men. It will result in millions of increased value to the cattle growers of the South.

*

GOVERNOR Odell, of this State, makes short work of agriculture in his message, and hurries on to what seem to him more important matters. He refers to Commissioner Wieting's report, and probably does well to let the Commissioner talk for him. The Governor suggests a good appropriation for the State Fair, wants the bounty on beet sugar continued, and suggests that the Agricultural Department should have charge of the work of stamping out tuberculosis and glanders among cattle and horses. That is a good suggestion, and the Legislature ought to act upon it this year. Agriculture, the most important industry in the State, receives 250 words out of a total of 15,000! Two questions naturally arise in this connection: Is agriculture any the worse off for this lack of attention? Would agriculture not receive more attention if the farmers of the State had fewer politicians between their real needs and the Governor?

*

A LIVE farmer cannot stand still. He must grow. All about him there is bustle and activity in trade, transportation and manufacturing. In the midst of all this mighty rush and change the farmer cannot stand still and live. Some farmers grow in spite of themselves. The institute, the experiment station or the agricultural papers drop a thought into his mind which he cannot shake out. In spite of all that farmer's reserve, his mind is filled with a craving for knowledge, and the thought grows and develops like bacteria in agreeable soil. Before long the farmer is brought face to face with the idea that some of his old practices and so-called "facts" are wrong. Perhaps the greatest test of a man's fitness to live longer is the disposition he makes of his mental dead wood. Among the worst enemies of American agriculture are the farmers who, while knowing that they ought to change their methods, lack the courage needed to destroy their old hobbies and opinions!

*

NOT long ago we had occasion to take a long drive across the country. It was a cold, windy day—the worst of the season. We put the horses up at a town stable. When we came to drive home at night, in the face of a fierce wind, we found that the stableman had put two hot bricks in the carriage. As every one knows, the feet are the doors through which comfort is driven out of the body by Jack Frost. No one thought of asking the stablekeeper to provide these bricks—he charged nothing for them. Where did he get any profit out of them? Why, our folks never will go anywhere else in that town to stable a horse. They will tell the story of the bricks, and advise all their friends to patronize that man. That makes reputation, which may be the best or the worst advertising a person can have. If a man is selling anything, be it potatoes, stable room or advice, he should give such good measure that his customers will be glad to go out and talk about it. The gift of a single fine apple may grow, in the mouth of a good customer, into a sale for many barrels. "We are advertised by our loving friends!"

*

THE financial statement of one of the great life insurance companies shows that among its assets are bonds of 19 different foreign governments amounting in all to $26,297,440. Probably most of these bonds were bought when foreign agencies of this company were established, but it gives an idea of the vast extent of our present system of life insurance. Nothing quite like it was ever known before in the world, and failure through mismanagement of half a dozen of the large companies, would sweep away the only money provision of millions of women and helpless children.

*

CONFIDENCE operators of all classes are usually supposed to prey upon the innocent and unsuspicious only, but there is no doubt that these adventurers occasionally succeed in swindling their own class. An example of this was the case of a Chicago street fakir, who recently succeeded in buying a lot of nickel watches for 50 cents each. He polished and otherwise treated these watches so that they would pass for silver and then departed for a small town down in Illinois. Here he put an advertisement in the local paper, stating that he had found a silver watch which would be restored to the owner on payment of $2, no questions asked. The next day he received a stream of callers, each of whom announced that he had come to redeem his watch. The watches looked genuine, and each would-be swindler, thinking it a good thing, cheerfully gave up $2. The Chicago man made $1.50 on each watch, and went back home serene in the knowledge that his dupes would make no complaint. It is likely that we shall hear of this mutual swindle in more than one locality.

*

BREVITIES.

THIS Stringfellow method of growing the peach
By making it hoe its own row,
Makes some fellows get on their hind legs and screech,
They claim that in order to grow
A peach that is fit for a king, you must wet,
The ground with your toil—that's the word,
And irrigate every last tree with your sweat,
And keep things eternally stirred.
This let-alone-policy don't suit the men,
With hustle and work in their veins,
They didn't let weeds grow beside their path when
They went out to fight for their gains.
It's hustle and jump—get a move on yourself,
Kick dust through the long Summer day,
Or else you'll be dusted and laid on the shelf,
And that's what these smart fellows say:
A man must be lazy,
He'll surely go crazy,
If he follows the Stringfellow plan,
'Twas good solid hustle,
Both mental and muscle,
Evolved us from primeval man!

THE soiling system cleans up the farm.

READ the pea-louse article on first page.

THE careless man's success is always an accident.

WE observe quite an increase in the use of wood for fuel.

DON'T contract the vice of giving advice and then expand it.

WHAT is a clean conscience? The interest on your principles.

BE a farmer, not only from way back, but for far future as well.

MR. PROCTOR (page 31), points out the difference between nerve and "nerves."

No doubt about it! The robber cow fears a lead pencil and a pair of scales.

THE chances are that there are too many fat formers in your Winter ration.

PURE food laws are good only when enforced by men who are fed on pure moral food.

THE great trouble with some men is that they have a conscience that is an "easy keeper."

YES, YES! Leave an egg 36 hours under a hen that wants to sit, and it will be at least five per cent hen.

ONE of our readers, who is 89 years old, is just planting a quince orchard. There's an example for you, young man!

IN our opinion, the little press bulletins issued by the Vermont Experiment Station are models for interest and brevity.

FARMERS are usually loud in their praise of Alfalfa until they come to plow a heavy field of it. The very big roots that provide the great yield will nearly break the plow.

WE still continue to receive letters arguing for and against the bee and his ability to destroy fruit. The law has now declared the bee *not guilty!* We cannot find space now to print more testimony.

Events of the Week.

DOMESTIC.—A plan of recruiting sailors for the United States Navy from the farms and the country towns is now under consideration at the Navy Department. . . . . The trolley system of Scranton, Pa., was entirely tied up by a strike December 27. . . . . The most destructive fire in the history of Calgary, North West Territory, occurred December 26, the ioss being $100,000. . . . . A mail pouch containing $100,000 in negotiable paper and an unknown amount of money was stolen from the Michigan Central passenger station at Wyandotte, Mich., December 28. . . . . Edwin G. Bedford died near Paris, Ky., December 31, aged 86 years. He was a noted breeder of Short-horn cattle, and paid the highest price ever given for a Short-horn buil, $36,000, at the New York Miils sale in 1876. . . . . At Tooney Creek, near the Wyoming boundary of Montana, masked and mounted raiders killed 2,000 sheep December 30. The sheep belonged to Daupt & Selway, who are ranging about 5,500 sheep in the Otter Creek country. There has been hard feeling between sheep raisers and cattlemen for some time. . . . . Five trainmen were killed and one badly injured in a freight-train collision at Melton, Miss., January 1. . . . . While attempting to escape the smallpox quarantine on a lumber camp near Sparta, Minn., January 2, one man was shot and killed by a guard.

CONGRESS.—Senator Frye, president of the Senate, has received from New York telegraphic petitions from Secretaries Carroll, Morgan, Moorehouse, Ellinwood, Speer, Cobb and Lloyd, representing the National Missionary Societies of the Methodist, Baptist, Presbyterian, Dutch Reformed and Episcopal Churches, asking that when the Senate convenes for the first time in the new century on January 3, its first call shall be the ratification of the treaty to protect the natives of Africa against intoxicants, and favoring a universal application of this new policy of civilization by additional treaties and laws.

PORTO RICO.—The Legislative Assembly of Porto Rico has been in session since December 3, when the House of Delegates was duly organized. The House has been holding daily four-hour sessions, over 45 bills have been introduced and no end of motions and amendments. But one bill has been passed. By law the Assembly is allowed 60 days in which to complete each session. The House is badly in need of a competent force of translators and clerks. There seems to be no system. Bills are prepared and introduced covering most common matters, and in a manner most unbusinesslike. Few of the bills are in proper form. Many have been filed written in pencil on a sheet torn from a scratch pad. Most of the bills are written during the session, and are more in the form of suggestions rather than of projected laws.

PHILIPPINES.—An appended report to General MacArthur's review of the civil affairs of the Philippines for the past fiscal year gives some rather startling facts regarding the introduction and prevalence of leprosy in the Islands. According to the estimates of the Franciscan Fathers, says Major Guy L. Edie, the writer of the report, there are no less than 30,000 lepers in the archipelago, the major portion of these being in the Visayas. A house-to-house inspection, begun last January, found more than 100 lepers concealed in dwellings. These were sent to San Lazaro Hospital, in Manila, but many others escaped into the surrounding country. A commission is now engaged in the work of selecting a suitable island or islands for the purpose of isolating all the lepers in the archipelago. . . . . A conspiracy to acquire claims to a vast amount of mining property in the Philippines has been reported to the War Department. Involved in the transactions are Americans, Englishmen, Spaniards and several citizens of other countries. The claims number 1,618. They cover 149,288,134 square meters of territory and are scattered throughout the mineral regions of the archipelago. More than 1,000 of the claims are for gold lands, 500 for coal, 100 for copper, 16 for iron, and the rest for sulphur, granite and petroleum. . . . . The Philippine Commission has completed the preparation of a bill establishing municipal government in the Islands. It establishes a land tax and abolishes the head tax and tax on occupations. There is a growing scarcity of money in the Philippines, the effort to maintain the arbitrary ratio of two to one between Mexican and American silver dollars having failed. The silver is being sent to China and India.

GENERAL FOREIGN NEWS.—The State Department has been notified by American Charge d'Affaires Griscom, at Constantinople, of the signing of a contract between the Turkish Government and the Cramps for a cruiser, under cover of which the American missionary claims of $90,000 are to be paid. It is expected that a check will be sent by the Cramp Company to Secretary Hay for the amount. This will end the diplomatic controversy with the Sublime Porte. . . . . The Japanese training ship Tsukishima Maru, which has been missing for more than a month, foundered with all on board; 121 lives lost. . . . . Anti-foreign agitation is increasing in Corea. The Russians are invading that country.

FARM AND GARDEN.—The American Devon Cattle Breeders' Club met at West Chester, Pa., December 26. The special business of the meeting was to arrange the Devon exhibit and competition at the Pan-American Exposition. The competition of the Columbian Exposition tending only to butter worth was condemned. milk and cheese being of even greater importance to the people as a whole. Rules, it was decided, should provide for the proper analysis of the curd and give credit for the smaller globule and for the quantity of sugar, all of which are important from the nutritive standpoint, and in food value exceeding the butter fat. Vice-President John I. Banker, Upsonville, Pa., was chairman; L. P. Sisson, Newark, O., secretary. Among those present were James Hilton, Albany, N. Y.; Jos. Hilton, New Scotland, N. Y.; A. S. Worden, Ulysses, Pa.; Dr. J. Cheston Morris. West Chester, Pa., and J. W. Zuber, Atlanta, Ga.

The Agricultural Department bulletin, issued December 27, states that the wheat crop of 1900 is 522,229,505 bushels; area of Winter wheat planted, 30,282,564. The condition of growing crop December 1 was 97. The production of corn in 1900 is estimated at 2,105,102,516 bushels.

Wolves are unusually fierce and aggressive in several counties of Minnesota, and are causing serious loss to farmers.

The State of Texas is asked to make an appropriation of $15,000 to erect three sub-experiment stations in the coast district, to study sugar cane, rice, cotton and tobacco.

Eight students from New York are enrolled for the six weeks' special course of study and training in poultry culture at the Rhode Island College. Bulletin 72, of the Rhode Island Experiment Station (Kingston) deals with the history and development of this unique experiment in agricultural education. This year a six-weeks' special course in horticulture is to follow the course in poultry culture. These popular courses serve to explain two kinds of farm life in such a way as to show their real advantages. This horticultural course, which opens February 20, will be under the direction of Prof. F. W. Card.

The Western Wholesale Nurserymen's Association, in session at Kansas City, Mo., December 11, expressed a unanimous opinion that there would be a rise in the price of nursery stock before Spring. The Association membership embraces the States of Alabama, Missouri, Iowa, Kansas, Nebraska, Colorado and Oklahoma Territory, and about 30 members were present. The following officers for the ensuing year were elected: President, A. L. Brook, Topeka, Kan.; vice-president, R. H. Blair, Kansas City, Mo.; secretary and treasurer, E. J. Holman, Leavenworth, Kan.; executive committee, Peter Younger, Geneva, Neb.; A. Willis, Ottawa, Kan.; R. S. Welch, Shenandoah, Ia.; J. H. Skinner, Topeka, Kan.; A. C. Griesa, Lawrence, Kan.

Secretary Wilson, of the Department of Agriculture, has placed the Government seed order with the New York Market Gardeners' Association at $101,975.59. The last contract, that for 1901, was awarded to Charles Parker, Santa Clara, Cal., at $64,900, and the order for 1900 was executed by the New York Market Gardeners' Association on a bid of $70,980.

A committee of seedsmen from the Seedsmen's League visited the United States Senate at Washington, December 20, to protest against further appropriations for free distribution of seeds by the Government.

State Entomologist Scott, of Georgia, has been sustained by the Federal authorities for destroying fruit trees infected with the San José scale.

A convention of corn growers and stockmen will be held at the College of Agriculture, University of Illinois, Urbana, Ill., January 14 to 25, and in connection a school of instruction in corn and stock judging will be given. Several hundred farmers are expected to attend the meeting. Along with the other work, tests of vitality of grains will be made free of charge by the class in farm crops. Some of the most prominent stock growers in the country will make addresses.

The Apple Crop of 1900.

Never before was there a year when the apple buyers made such a systematic and persistent effort to get the apples for such a small price as this. From the opening of the Spring they kept the papers full of reports of an over-abundant crop. Everywhere they were talking of the 1896 crop and low prices, and the worst of it was that they made many orchardists believe their story, and bought the crop for half what it was worth. I know of several instances where the orchards were sold for what amounted to less than 50 cents per barrel, and the owner did all the work; in one or two instances small farms with a large proportion of apple orchards were bought by a dealer so that the crop gathered paid for the farm. At one of the monthly meetings of our County Farmers' Club the question came up: "What are we going to do with our 1896 crop of apples?" and I was called on to answer it. I said: In the first place we have not an 1896 crop, nor anywhere near it. Then every apple tree and stub had a crop. Now, there are large sections of western New York where there are not enough for home use; nowhere are there as many as in that year. I asked those whose crop promised as many as in 1896 to raise their hands; only one went up. I asked for those who had three-fourths as many, to show hands; one-fourth the audience raised hands. To the request for those with half as many to show hands, half the hands went up. I then said: "There will be a demand for all the apples we have at fair prices. Even were the crop as large as in 1896 the conditions are now so very different from then that the apples will all be taken at much better prices than then. Now, times are good. Everybody has work at good wages, and the laboring man, who eats our apples, has the wherewithal to buy. So don't be fooled into giving away your apples." Still, as shown above, some were so misled. Many farmers sold their firsts, barreled, at from $1.25 to $1.40. They afterwards sold the "drops" at $1.50, and still later the better windfalls at $1.55 to $1.65, so there was no excuse to put poor apples in the middle of No. 1 fruit. A good lot of No. 1 now would sell readily at $2. It will be a long time before farmers will be so easily beguiled into selling their apples before they are picked, and some of those who sold their farms for less than the apples would have brought are trying to find some cheap mule to kick them.

J. S. WOODWARD.

The New York Cabbage Crop.

I have just returned from a three days' trip in Ontario and Tompkins counties, N. Y., buying cabbage. The amount stored in that section is about 4,000 tons; three-fourths of this amount is in the hands of shippers. I saw a few lots, from 50 to 100 tons, of very fine stock held by growers, but most of it held by growers is small and undesirable. Most farmers refuse to sell direct to buyers, and usually sell through a shipper at a loss of from $1 to $3 a ton to the grower. I cannot account for this, only that they lack knowledge of business methods in shipping goods. Again, I offered some farmers 80 per cent of purchase price in advance, but was unable to deal direct, only at an advance of $2 to $3 per ton. The average farmer knows very little about sight drafts, and 90 per cent of them refuse letters of credit, bank and railroad agents' references. At the same time, if one were to pay them a small amount down on an advance of a few dollars a ton above the market price, they seem perfectly willing to contract and ship their goods without any reference whatever. It is indeed strange that farmers will continue to let the speculator make all or most of the profit from their hard labor. There are three railroads through the great cabbage section of Ontario County; the Pennsylvania Railroad alone has hauled 4,000 cars of cabbage this season. On an average of 13 tons per car, 95 per cent of this passed through shippers' hands at a profit of $1 and $2 per ton that should go to the farmer, and would be theirs only that lack of judgment and business methods among farmers gives this amount to the speculator, who is yearly growing fatter and fatter on the farmers' hard labor. I met one gentleman who is agent for a large Pittsburg firm that has been in the cabbage section, shipping from three to five cars a week since October 1. He informed me that he first aimed to buy direct from the farmers, paying highest market prices, but was unable to deal with them. He then made a contract with a speculator to buy his goods for $1.65 per ton. The farmer, of course, takes that amount, and often more than that below market price.

A. G. M.

Boxes for Apples.

Here are more notes from commission men about the plan of packing apples in boxes instead of barrels. It will be seen that the do not favor the change. That being the case, will THE R. N.-Y. stop talking about it? Well, no—all the more reason why we should keep at it. We feel sure that the box is a profitable package for producer and consumer. We are not building fences between these two parties—we are trying to tear one down

The apple package most desired by our customers in this market is the three-bushel barrel; boxes are not approved of under any circumstances.

Milwaukee, Wis. L. A. SCHIAPPACASSE.

We are receivers of apples only in a small way, and possibly our advice would not be worth much. We believe that the smaller packages are better for one reason, that it avoids deception on the part of the packer. It is harder work to deceive in small packages than in barrels, for more apples can be seen. G. L. BRADLEY & CO.

Minneapolis, Minn.

We doubt very much whether it is advisable to pack apples in boxes or smaller packages than barrels. A great many boxes have been used this season in marketing apples, but we think that the results will be very unsatisfactory. Fruit packed in boxes, such as you refer to, is subject to all changes of temperature. The fruit is very often damaged by the slats used in the boxes. We advise all shippers to use nothing but new barrels in packing apples. By following this advice, we think that best results will be obtained. THE KELLY CO.

Cleveland, O.

We cannot say that we are in favor of boxes for apples. We rather think it may lessen the consumption, as some may be only inclined to buy a box instead of a barrel. Also, it seems to us it would be more expensive to furnish boxes, and their handling. Hardly think that apples in boxes would keep as well in storage as they would in barrels. But something should be done to avoid practicing deception in packing apples. Often apples are faced up nicely, and inside of the barrel they are poor and worthless stock. There should be a law passed that every packer should have his name and address on the barrel, and if he practices any deception he should be held accountable for it. HILLMAN BROS.

Minneapolis, Minn.

Impudence of the Oleo Men.

We have received a copy of the Minneapolis Journal containing the following sound talk:

The situation in the Senate affecting the Grout bill is suspicious. The dairy interest is made up of farmers who individually have no money to spend to promote legislation, while the oleomargarine interest is made up of the big meat packers who maintain an extensive and expensive lobby in Washington, and apparently have sufficient influence with the agricultural committee to delay and possibly to block indefinitely the Grout bill for the protection of the buttermakers by prohibiting the counterfeiting of their product. The oleomargarine makers claim that if the fat of beef and pork cannot be manufactured into imitation butter it means a loss of $55,000,000 on cattle and $7,000,000 on hogs. Nobody proposes to prevent the manufacture of this fat into a substitute for butter; all that is asked is that this tallow and lard shall not be colored to imitate butter and sold as butter. What the oleo people demand is the privilege of counterfeiting the real article with a cheaper, inferior product, and they are trying to get the permission of the Senate of the United States to perpetrate this fraud upon the public. They know that the public will prefer real butter to tallow or lard when they can see the difference.

It would seem as if the very transparency of this fraud and the impudence of the proposition which the oleomargarine people make would kill their case in the Senate, for on its face it is an insult to ordinary honesty, but for reasons best known to themselves, members of the Senate listen with patience, and even with favor, to the counterfeiters. Among those who look with favor upon the oleo interest and oppose the Grout bill is that eminent Populist and friend of the farmer, Senator Allen, of Nebraska, who, until lately, had been counted a friend of the butter men, but has recently changed front for some reason.

There is evidently a hard fight before the buttermakers in the Senate, but there is still reason to hope that common fairness will dictate the action of a majority of that body and that the dairy interest will be protected from ruinous competition of the hog butter men by prohibiting the coloring of oleomargarine to look like butter and the selling of it as butter.

THE weather here has been exceedingly fine since the first of the month, no snow, but little wind and not very cold; 46 degrees above zero December 16, with not a cloud to be seen, and hardly enough wind to tell its direction. Some farms are changing hands at $12.50 to $15 an acre. Potato crop rather light from 25 to 100 bushels per acre. Mine went 100 bushels; heard of none other at over 65. Many cattle are dying of cornstalk disease; one man lost 37 in two days; many others lost from three to 10. Potatoes are 30 cents; wheat, 57 cents; corn, 23 cents; oats, 20 to 23 cents; bran, $10 per ton. W. H. H.

Letcher, So. D.

Woman and Home

From Day to Day.

Say, I've got a little brother,
Never teased to have him, nuther,
But he's here;
They just went ahead and bought him,
And last week the doctor brought him,
Wa'n't that queer?

When I heard the news from Molly,
Why, I thought at first 'twas jolly,
'Cause, you see,
I s'posed I could go and get him,
And then mamma, course, would let him
Play with me.

But when I once looked at him
"Why," I says, "Oh, my, is that him?
Just that mite!"
They said, "Yes, and ain't he cunnin?"
And I thought they must be funnin'—
He's a sight.

He's so small, it's just amazin',
And you'd think that he was blazin',
He's so red;
And his nose is like a berry,
And he's bald as Uncle Jerry
On his head.

Why, he isn't worth a dollar!
All he does is cry and holler
More and more,
Won't set up; you can't arrange him—
I don't see why pa don't change him
At the store.

Now we've got to dress and feed him,
And we really didn't need him
More'n a frog;
Why'd they buy a baby brother
When they know I'd a good deal ruther
Have a dog?

—Little Folks.

*

AMONG the Christmas novelties noted this season were sleeve links and brooches of abalone shell, mounted in gold, said to come from Mexico. The abalone or sea-ear is a univalve mollusk found on the Pacific coast, where it clings tightly to the rocks. The shell is lined with mother-of-pearl, dusky of hue, shot with green and pink, much more iridescent than the oyster-shell mother-of-pearl.

*

THE clothes closets built in modern city houses show a great improvement over the old wardrobe with hooks fastened against the wall. In the new models, stout hooks of smooth metal are fastened in the underside of the shelf at regular intervals. On each of these hooks a heavy wire hanger is put. Coats, wraps, waists and dress skirts, hung on these forms remain stretched out so that they cannot wrinkle, and they do not take up nearly so much room as when hung on the old-style hooks. A shirt waist should always be hung over a coat-hanger when not in wear; cotton waists keep fresh much longer when so treated. They should, of course, be aired before being put in the closet.

*

THE New York Sun tells about a small girl who recently caused a family sensation. Her grandmother, living in the West, sent word some weeks ago to her daughter's family in New York that she would be unable to spend Christmas with them as planned. Great was the sad wailing and gnashing of teeth thereat among the grandchildren. Without their grandmother Christmas, Santa Claus and all would scarcely be Christmas. The other day the grandmother received a letter. "Dear Grandmother," it read, "we're all awful sorry you won't be with us Christmas, but never mind, you'll be sorry, too, for you'll not see the new baby that's just come." The name of the eldest granddaughter, Ethel, aged 10, signed the letter. Off went a telegram from the amazed grandmother to her daughter. "Why, in Heaven's name, was new baby kept a secret?" it asked. "Have just heard of it through Ethel's letter. Let me know particulars at once." If the grandmother was amazed, the daughter was dumbfounded. "There is no new baby," read her answer, "see letter." The whole thing proved to be an invention of the sagacious Ethel, who, having observed that her grandmother was never known to fail them upon the arrival of a "new baby," took this means of securing her for Christmas.

*

ONE of the new ideas which some furriers have tried to start this Winter is a bright silk lining in the ears of the furry animal heads used on neck scarfs or muffs. The effect is, of course, singularly grotesque. These heads seem larger and more ferocious in appearance than ever this Winter, and there is certainly some grounds for a recent newspaper cartoon, depicting

3193 Tucked Skirt
22 to 30 in waist.

the terrors of the shopping districts, in which terrified men tried to escape from the savage monsters worn in this way. The fur wraps, both collars and boas, have kept on increasing in size for several years. The mink collars so popular six or seven years ago now look very little and skimpy, when one sees an occasional survivor worn among the present styles. The boas of fox, or brown bear of this Winter's mode are not only very thick, but are much longer than heretofore, the ends reaching almost to the hem of the dress. Naturally the price increases with the size, and fashionable furs are a costly luxury.

The Rural Patterns.

The waist shown in No. 3699 is especially designed for stout figures. As shown it is worn by a woman of advanced years, but the lines are arranged with reference to a slender effect only. Upon the material chosen must depend its suitability to age and condition. The original is in plum colored satin cloth with velvet of the same shade, harmonizing passementerie, and front and undersleeves of chiffon enriched by motifs of lace applique. Younger women would prefer lighter color, but require no change in design.

The foundation for the waist is a fitted lining that includes double darts, side backs and double under-arm gores. The material is laid smoothly over the under-arm gores, but cut to form a V, and elongated side backs that are arranged over the lining. The fronts include single darts and stole extensions that tend to lengthen the waist and are turned back to form revers. The full vest is simply gathered and is included in both shoulder seams and closes at the center, where the fullness conceals the fact. The sleeves are in bell shape over a snug lining, to which the undersleeves are attached.

To cut this basque for a woman of medium size 4 yards of material 21 inches wide, 2 yards 44 inches wide, or 1⅞ yard 50 inches wide, with 1¼ yard 21 inches wide for front and undersleeves, and ⅜ yard of velvet, will be required.

The pattern No. 3699 is cut in sizes for a 36, 38, 40, 42 and 44-inch bust measure, price 10 cents from this office.

A skirt with perpendicular tucks is now in favor, and is especially becoming to short stout figures. In the design illustrated, the group of tucks, three each, are arranged at the front and side seams with the pointed straps between producing a panel effect. As shown the skirt is made of mode colored Venetian cloth, with the straps in a darker shade, but velvet, silk or braid can be used in contrast with a cloth foundation, and the color can be the same or a harmonizing one, as preferred.

The skirt is cut in five gores. The tucks are allowed at the edges of the front and back gores, those at the front turning backward, those at the back turning forward, and are stitched to the point indicated, below which they fall free to intensify the flare. The straps are arranged as indicated and stitched into place. The skirt fits snugly at the upper portion and includes short hip darts in the side portions. The fullness at the back is laid in an inverted plait.

To cut this skirt for a woman of medium size 6⅜ yards of material 44 inches wide, or 4⅞ yards 50 inches wide, will be required.

The pattern No. 3693 is cut in sizes for a 22, 24, 26, 28 and 30-inch waist measure, price 10 cents from this office

Rural Recipes.

He married a girl who couldn't cook,
And thus his hopes ran high;
But alas! she bought a recipe book,
And just begin to try.
Poor chap!
She just began to try.

—Phila. Record.

Apple Layer Cake.—One cupful of sugar creamed with half a cupful of butter; add the beaten yolks of four eggs, one-half cupful of milk, two cupfuls of flour, with two level teaspoonfuls of baking powder sifted through it. One teaspoonful of lemon or almond extract and the beaten whites of the eggs. Bake in three layers. When cold spread

3699 Basque with Full Vest.
36 to 44 in. bust.

with this mixture: Peel and grate four large apples, beat into them one cupful of sugar, two teaspoonfuls of melted butter and two whipped eggs. Pour into a porcelain saucepan and stir steadily over a moderate fire until the mixture has boiled one minute. Remove from the fire, add two teaspoonfuls of lemon juice, a dash of powdered cinnamon and two tablespoonfuls of minced almonds. Cool it and build the cake, sprinkling the top with powdered sugar. Cap the top generously with whipped cream, flavored and serve at the table.

Chocolate Nut Cake.—One pound of English walnuts, shelled. Reserve 42 unbroken halves and chop fine the remainder. Beat to a cream one cupful of granulated sugar and one-half cup of butter. Add two eggs, one at a time and beat well. Stir in alternately one-half cupful of milk and 1½ cupful of flour, adding a level teaspoonful of baking powder to the last half cupful of flour. Bake in two layers. Let the cake cool somewhat before adding this icing: Butter a granite kettle, add two ounces of chocolate (grated), three-quarters of a pound of light brown sugar and one-half cupful of new milk. Cook to the soft ball stage (or when a soft ball is formed when dropped in ice water). Add butter the size of a hickorynut, remove from stove and add one teaspoonful of vanilla. To one-third of the icing add the chopped nut meat; stir until cool enough to spread and put between the layers. Cover the top and sides with the remaining icing, which should be kept soft in an outer dish of hot water and arrange upon it the unbroken meats at regular intervals.

Buttermilk Pie.—Beat together a heaping cupful of sugar and four eggs; add half a cupful of butter; beat thoroughly and add 1½ pint of fresh buttermilk; line pie-tins with crust; slice an apple thin and lay in each pie; fill crust with the mixture and bake with one crust.

Duchess Potatoes.—Pare and chop coarsely four large potatoes and add one small minced onion. Season with teaspoonful of salt, half saltspoonful of pepper; put in baking dish, dot the top with bits of butter—one tablespoonful—and sprinkle one tablespoonful of flour over all; cover with milk and bake one hour in moderate oven, keeping the dish tightly covered. Serve hot from same dish in which it was baked.

Baked Cabbage With Cheese.—Boil a firm white cabbage for 15 minutes in salted water, then change the water for more that is boiling, and boil until tender. Drain and when cool chop fine. Butter a baking dish, and lay in the chopped cabbage. Put one tablespoonful of butter in a frying pan; when it bubbles stir in one tablespoonful of flour, one half-pint of stock, same of boiling water; stir until smooth. Then season with saltspoonful salt, half as much pepper, four tablespoonfuls grated cheese. Pour over the cabbage, sprinkle cracker crumbs over the top, dot with bits of butter and bake in a quick oven 10 minutes.

Plum Roll.—Sift together one pint of flour, one teaspoonful of baking powder and one-half teaspoonful of salt; rub into the prepared flour one tablespoonful of butter and make into a soft dough with milk or water; roll out quite thin, sprinkle with one cup of seeded chopped raisins, one-fourth of a cup of chopped citron and half a teaspoonful of cinnamon; roll up and steam for forty minutes; serve hot, with hard sauce.

A Woman on Oleo.

HOW ONE HOUSEKEEPER REGARDS THE GROUT BILL.

"What a shame it is that Congress has passed the oleomargarine bill," said Laura; "they will drive the manufacturers out of business. The price of butter will go way up, and then what will the poor laboring man do? The manufacturers cannot make it and compete with butter if they have to pay a tax of 10 cents on the pound.

"But they only have to pay a tax of 10 cents," interposed Martha, "on butterine colored in imitation of butter; the tax on uncolored butterine is reduced by the bill from two cents to one-quarter of a cent a pound."

"But people will not buy it," said Laura, "unless it is colored, and so the manufacturers who realize this will close their factories at once if the bill passes. Then think of the suffering of the poor people! Butter will go up out of sight! Widows and orphans will have to eat their bread dry! Mr. McMurtaugh told me so last night, with tears in his eyes. He said he did not see how Congress could be so heartless as to bring such sufferings on the poor."

"Who is Mr. McMurtaugh?" asked Martha.

"He is a butterine manufacturer," Laura replied.

Really, Martha," said Hepzibah, grimly, "you are incorrigible. Can I never break you of the family trait of asking foolish questions?"

"It was a little obvious, I confess," replied Martha with a smile, "but, aunt, you do not seem to understand the socratic method of imparting instruction by questions. Allow me to continue. Why, Laura, will not the poor man buy uncolored butterine?"

"Because it does not look like butter."

"What are the organs of taste?"

"The tongue and palate, I suppose, and I have heard it stated that the nose has a great deal to do with it."

"Do we eat things on account of the taste or on account of the looks?"

"The looks have a great deal to do with it, anyway," snapped Laura.

"Why is this?"

"Things that do not look attractive are not appetizing."

"Are you fond of persimmons?"

"Yes, when they are thoroughly ripe; they are puckery and horrid before the frost has touched them."

"Is not a ripe persimmon shriveled and ugly, like a rotten apple?"

"I suppose it is."

"Is not a plump, unripe persimmon much more attractive in form and color?"

"I must confess it is," admitted Laura, unwillingly.

"Do you prefer your bread white or yellow?"

"White."

"Are you fond of ice cream?"

"Very."

"Are not several of your favorite kinds white?"

"Yes."

"Are you fond of truffles?"

"I adore them."

"Is there anything æsthetic that appeals to the eye in a truffle?"

"Well, hardly."

"Then why will not people eat white butterine?"

"It must be because they are used to the yellow color of butter."

"Did you ever eat butterine?"

"Yes; a great many times. I supposed I was eating butter at the time and did not notice the difference, but found out afterward that it was butterine. I never bought any to use on the table."

"Then is not most of the butterine sold because those who use it think they are using butter?"

"But the old law prevented the sale of butterine for butter."

"Oh, no," replied Martha, "you are very much mistaken there; the law now in force provides penalties for selling butterine for butter—that is a very different thing. You will notice convictions under this law among the news items nearly every day, and we all know that means a great many offenders escape where one is caught, and the business must be profitable or men would not continually brave the risks of conviction. We will assume that the large manufacturers always sell their product as butterine. Nevertheless the manufacturer profits by the fraud, for many of his customers are jobbers and grocers who palm the stuff off on the unsuspecting public as genuine butter."

"But would you entirely suppress the manufacture of butterine?" asked Laura,

"By no means," replied Martha, "but I believe in the old adage, 'Let every tub stand on its own bottom,' whether it be a butter tub or an oleomargarine tub. In fact, as you well know, for years I have urged the domestic manufacture of butterine—that is to say, the trying out of beef suet on the kitchen stove, mixing it with an equal part of softened butter and allowing it to harden for use in frying and other culinary purposes. This I have called cooking butter. Thus is insured a pure article and payment of excessive profits on butterine avoided."

"Anyhow," said Laura, "I do not believe in sacrificing one industry for the benefit of another."

"That is an argument with which I have no patience," Martha said. "Has the commercial spirit of the age reached such a point that a paternal government must extend its tender fostering care over the manufacture of fraud and lies if sufficient capital be embarked in the enterprise to make it important? Shall we say that the laboring man, like an infant, must be protected against his prejudices, and because the poor man will not eat white oleomargarine (that is, the kind-hearted makers say he will not) is he to be legally fooled for his greatest good by a little philanthropic saffron, into the idea that he is eating pure butter? We might as well repeal at once all laws for the protection of trademarks and let any man put any other man's name he chooses on his goods. It will be found that a suffering world will revolve as usual without colored butterine. The manufacture of the article will not stop, though the excessive profits may. It will be just as good as ever for cooking purposes. Pure white lard is much used in the kitchen, or rather would be if it could be obtained instead of the adulterated stuff on sale, which, however, carries no saffron from among its foreign ingredients."—Chicago Record.

Grandmother's Recipes.

Grandma is one of those who can mix and flavor and bake to perfection without the aid of a cook-book, says the Youth's Companion. She was born to her profession, not made for it by practise and discipline. But alas for her who hopes to copy grandma's recipes, for they do not exist, save in her own brain, and they could never be transferred to paper.

Not so long ago one of the granddaughters went over to the old house with pencil and paper to take down some of the most valuable rules, to make a cook-book of her own, and present copies to all the nieces.

Grandma was delighted to be asked. She sat down, smoothed her apron, folded her plump hands and said:

"Yes, dear, yes. I should admire to give you my receipts, every one of 'em.'"

"We'll begin with the simplest," said Dora, in a businesslike tone. "Apple sauce, now. Yours is better than anybody's. How do you make it?"

"Well, said Grandma, genially, "I peel my apples nice, and quarter 'em and put 'em on the stove with a little water."

"How many apples?" inquired Dora. "How much water?"

That was a poser. Grandma looked at her in real distress.

"Dear me, child," said she, "I can't tell you that to save my life! Why, just take 'em to the pump and pump a mite on 'em."

"Well," said Dora, trying to approach the subject by a different road, "sugar, now. How much of that to a quart saucepan full of apple?"

Grandma looked at her benignantly.

"I just take the sugar-box over to the stove," said she, "and put on—well, what's required. Yes, dear, with my little scoop!"

The apple sauce was given up for graver matters; but there, also, lurked defeat. When it came to buns, Grandma put in currants, but—how many?

"Oh, I don't know, dear," said she, easily. "Not many. Here and there a traveler."

Lamb broth she simmered "till it was done."

"When the goodness is all out o' the meat, child," said she, somewhat pityingly. "Dear me, you can tell that!"

Sour milk gingerbread is one of her masterpieces. Yet how much soda does she use to a cup of milk?

"Enough to sweeten it, dear," says Grandma, "and make it rise real good. You'll know when you try it."

The interview was given up. Dora sat with idle pencil and useless paper, while Grandma, quite unconscious of proving a disappointment, beamed through her glasses and discoursed on the ease of cooking properly, if one gave one's mind to it. Then the dear old lady rose and went out to "get supper," a meal calculated to fill any inexperienced cook with envy to the brim.

Grandma could do it to perfection, but she could not tell how.

MOTHERS.—Be sure to use "Mrs. Winslow's Soothing Syrup" for your children while Teething. It is the Best.—*Adv.*

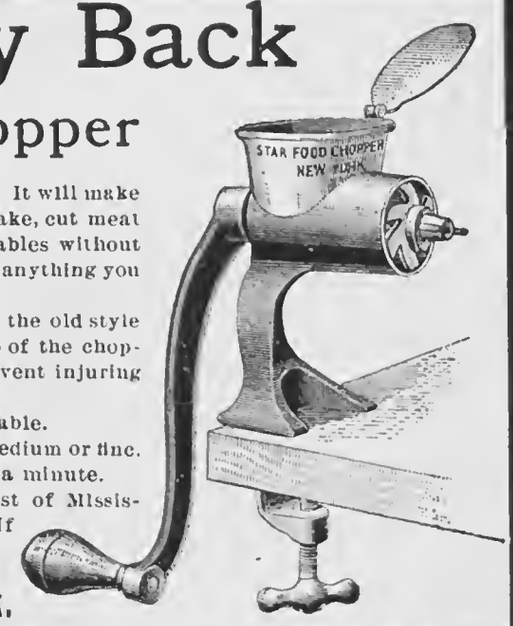
The Domestic Sheep.

Its Culture and General Management. By Henry Stewart. An up-to-date book on sheep. The most scientific, practical and useful book ever published on this subject. Indorsed by the world's highest authorities, press and sheep public everywhere. It contains 372 pages of "boiled-down" knowledge and 165 plates illustrating the recognized breeds and every department of sheep life. Price, $1.50 postpaid, or free for a club of four subscriptions at $1 each.

Your Money Back

if the Star Food Chopper



Is not just what you want and all you expected. It will make your mince meat, cut your raisins and citron for cake, cut meat for your sausages, chop poultry, fruit and vegetables without mashing, **and grind your coffee.** It will make anything you now make with a chopping knife and bowl.

The **Star Chopper** has many advantages over the old style machines, among which is a plate hinged at the top of the chopper to press the food into the machine, and prevent injuring or soiling the fingers.

Knives require no sharpening—simple and durable.

Three sizes of cutters for chopping coarse, medium or fine, furnished with each chopper. It chops two pounds a minute.

I will send a **Star Chopper** to any address, east of Mississippi River, express prepaid, on receipt of $1.25. If you are not satisfied, your money back.

Send for full description.

CHAS. D. BROWN, 24 Hudson St., NewYork.

ESTEY

An Orchestra at Home

The stops of the Estey Organ are beautifully and correctly voiced and the player after acquiring some degree of skill in their use can bring out a variety of tonal effects which permits the correct and satisfactory rendering of orchestral music of almost every description.

The range of an Estey Organ is far greater than that of a piano, violin, or any other kind of instrument. Hear it and be convinced.

Catalogue free. **ESTEY ORGAN CO., Brattleboro, Vt.**

MARKETS.

REVIEW AND OUTLOOK.

POTATOES have remained at about the samc figure for a number of weeks, and there arc no apparent reasons for an immediate advance in priee. The present cold snap hinders the free movement of the erop, and there are many complaints of frozen stock. Reeelpts from Bermuda are increasing, thc tubers bringing about twiee as mueh as the home-grown product.

EGGS are goIng up again, an advance of two eents per dozen being noted on last week's figurcs. The rise affeets fresh-gathered stock most, yet there ls getting to be a decided scarcity of choice refrigerator goods.

HOP prices remain firm, and holdcrs are looking for a little rise when the brewers lay in their new stocks. The highest figures noted are 19@21 cents for choiee 1900 New York State.

MILK PRICES.—At the last meeting of the New York Consolidated Milk Exehange it was voted to reduce the price of milk from 3¼ to three eents per quart for all points within the 26-cent freight zone.

MILK.

New York Exehange price within 26-cent freight zonc, three cents per quart.

THE Golden Egg states that the probable egg crop in this country for the year 1900 will number 13,000,000,000 eggs, and that if these eggs were stood on end one on top of the other they would reach almost 500,000 miles high.

BUSINESS BITS.

It would seem that no farm family could afford to be without a food ehopper at the price the Star is offered in this issue. Read the offer on another page.

THE Pierce-Williams Company, South Haven, Mich., are making a first-class quality of fruit and vegetable baskets and boxes. These packages are very strong, light, convenient, and attractive in form. If you are a shipper—large or small—write for their frec catalogue. You will get better returns if you pack properly.

MR. A. M. GRANT, superintendent of Phillips' Academy, Andover, Mass., writes that he is convinced that the use of Asbestine Cold Water Paint retarded the spread of the fire from which they suffered December 10 last. In faet, he gives this paint credit for saving the buildings. The fire-proofing quality aecredited to this paint is one that will have great weight wlth paint users.

EVERY farmer that has not learned the food value and the economy of crushed or ground cereals in cattle feeding, the eonvenienee of grinding grains for home use, and the profit in working for neighboring farmers should write to Sprout, Waldron & Co., Muncy, Pa., for their catalogue of mills. These mills are next to indestructible and very rapid in their work. Purchasers get a guarantee that really protects them, but the mills are sold on trial.

A HORSE-TRADER.—The Horseman tells this story of a Miehlgan man: "It is related of him that this year he bought a pair of horses and made the crops on his farm, then sold the horses for a farm, the farm for a house, the house for a team, buggy, harness, etc., sold one horse and a buggy, sold the harness for a pig and a wagon, made three horse trades with the remaining horse and now has a horse, a wagon and pig for sale. In a year he has owned and traded 20 horses, each of whlch was the 'best' horse in Newaygo County."

ROAD NUISANCES.—There have been a number of legal cases in England reeently growing out of the poisoning of llve stock. The leaf of English yew tree, an evergreen, is poisonous. Clippings from a tree or hedge were allowed to remain on the roadside. A heifer ate some of these leaves and was killed. Suit was brought against the man who trimmed the hedge to recover damages. The case seemed to hinge upon the faet that the leaving oi these trimmings on thc public road was a nuisanee. The judge held that it was a public nuisance to put anything on the highway that was dangerous to man or beast lawfully using the road. It did not matter whether the person who put it there knew or did not know that it was dangerous. The judge also said that the farmer had no right to put hedge trimmings on the road whether they were dangerous or not, for that amounted to using the public highway for a private purpose, which was not justified. The result was a verdict for the value of the heifer. This deeision indicates that in England at least anything placed on the highway must be regarded as a nuisance if it interferes with the lawful use of that road by any citizen. Poisonous shrubs, wild cherry leaves, or twigs would come under this head the same as pieces of glass, thorns or tacks, which might injure the foot of a horse or puncture the tire of a bicyele.

BROWN'S BRONCHIAL TROCHES

TRY THEM FOR Coughs, Colds, Asthma, Bronchitis, Hoarseness, and Sore Throat.

Fac-Simile Signature of John D. Brown & Son on every box.

WANTED—Party to ship me fresh Butter and Eggs weekly. Address JAS. F. MARBARGER Drehersville, Schuylkill County, Pa.

GLENN RANCH,
Glenn County, California,
FOR SALE IN SUBDIVISIONS.

This famous and well-known farm, the home of the late Dr. Glenn, "the wheat king," has been surveyed and subdivided It is offered for sale in any sized government subdivision at remarkably low prices, and in no case, it is believed, exceeding what it is assessed for County and State taxation purposes.

This great ranch of 40,000 acres runs up and down the western bank of the Sacramento River for 15 miles. It is located in a region that has never lacked an ample rainfall, and no irrigation is required.

The river is navigable at all seasons of the year, and freight and trading boats make regular trips.

The closest personal inspection of the land by proposed purchasers is invited. Parties desiring to look at the land should go to Chico, California.

For further particulars and for maps, showing the subdivisions and prices per acre, address personally or by letter,

F. C. LUSK,

Agent of N. D. Rideout, Administrator of the Estate of H. J. Glenn, of Chico, Butte County, California.

LOCAL AGENTS wanted in every section to sell my New Crop Seeds. New plan. Quick sales. Big profits. Splendid outfit. Write to-day. FRANK H. BATTLES, Seed Grower, ROCHESTER, N. Y.

OUR NEW PLAN, Samples, Circulars, Etc., Don't wait, send your name and address anyway. **FREE** Address GRAY & CO., PLATING WORKS, 729 Miami Building, CINCINNATI, OHIO.

[We recommend above Company as thoroughly reliable.]—EDITOR.

January 15

is the last day for clubs to count for those cash premiums. There are 50 of them—probably enough to go around to all that have sent clubs of any size. It is a question with most club-raisers who have sent clubs simply how big their premium is to be. That depends not on a big club, but on the relative size of a good many small ones. The largest premium is $100. Then come premiums of $75, $50, $30, $20 and so on down. Just a few names now may make a difference of $25 to you in the premium. For the smaller premiums it may make a less difference, but if it were only $10 or $5 it would be worth while to hustle around for a day or two. Besides all this, those $2 bills go out every day to the largest daily clubs. All clubs mailed January 15 will count. Be sure that the postmark is plain on the envelop; or if you write the number sent it will count. Here are the daily winners for last week:

Dec. 31. S. F. Johnson, Ohio.
Jan. 2 Jay E. Allis, New York.
Jan. 3. Mrs. C. B. Curtis, New York.
Jan. 4. Mrs. C. B. Curtis, New York.
Jan. 5. Jay H. Bowker, New York.

We wanted to make the first day of the new century a record-breaker. But it was just a few names short of our best previous record. This was probably due to a delay in the mails, as the next day brought up the average so that the two days beat any two corresponding days of other years, and the first week is far ahead. This report is due those who contributed to the result, and as we cannot thank each one separately, we here say "thanks" to all. Our New Year's resolve is to give readers the best value that they will get for any dollar invested this year.

THE RURAL NEW-YORKER.

Market Briefs.

PICKED UP HERE AND THERE.

SLEIGHT OF HAND.—The following item appears in a New York paper under the head of Business Troubles:

"Chas. L. Pettis and Harvey J. Hunter, comprising the firm of C. L. Pettis & Co., wholesale dealers in produce at No. 204 Duane st., New York, have made an assignment to Uriah W. Tompkins. Before the assignment the sheriff received an attachment against Mr. Hunter for $2,496 in favor of Norman T. Kerr, but found nothing at the store on which to levy."

We have received a number of inquiries about the firm mentioned above, and others doing business in the same lines, namely, buying country produce for cash at prices above the market, and in all cases have advised correspondents to be careful about shipping to those who make such extraordinary promises. It seems to do but little good to publish the names of frauds. While people are reading the names and thinking what first-class scalawags they are, somebody else comes up like a mushroom with a new proposition, which is simply a warmed-up hash of the methods of his predecessors in the fake family, and who for a consideration can get some so-called banking firm to give him a reference. We hope that our readers will give the cold shoulder to all of these commission merchant magicians who can be in one place one minute, with unlimited facilities for handling at a premium anything that a farmer has a mind to ship them, and then all at once disappear, like an icicle on a red-hot stove. There may be some good reasons why people who steal in this way should be allowed to go on ad libitum without punishment, while the man who picks your pocket or holds you up in some dark street is put behind the bars if caught, but the writer fails to discover any particular difference between the two methods. The highwayman at least does not add to his crime by lying about what he intends to do. As soon as he puts the revolver under your nose, you know just what he is after, and thus, in a way, he is entitled to credit for his honesty.

A TOUGH PROBLEM.—A reader on Long Island says that he recently sent 40 three-bushel sacks of potatoes to a commission dealer in this city. They sold at $1.75 per bag, or $70 for the lot. Out of this was deducted $7 commission, $2 cartage, $10.80 freight, and $2.40 for 40 sacks, which the commission man bought here and sent to the shipper. These charges amount to $22.20. He wonders where his profits are coming in. It is somewhat discouraging to the grower to have to turn in nearly one-third of the value of a crop as marketing expense. The freight charge in this case, $10.80 for transporting 120 bushels of potatoes 80 miles, seems excessive. The other items are not unusual. The charge for bags is all right. Six cents apiece was what they cost the dealer, and the general rule is that the package goes with the goods. That is, the price is made on this basis, and, if the buyer returns the package, he usually gets a rebate. Some commission merchants, in order to appear unusually generous, would have made no charge for the bags, and returned the price at which the potatoes sold at just so much less, thus making themselves even. There is no way for the shipper to find this out unless he comes to the other man's office and demands to see the account on the books. If caught in this way he could squirm out of it without any trouble. However, there are plenty of honest dealers who will tell just what the goods sold for, and give an itemized account of expenses. In the city, where rents and all other charges are high, it is not reasonable to expect that merchants are going to give away anything unless they get an equivalent of some sort. The principle is the same as in some clothing stores, where with every suit of clothes, a pair of suspenders, a necktie and one or two other articles are "thrown in." The buyer pays for all these things, however, for the clothing man knows that he is expected to donate these extras, and makes the price accordingly.

A MALICIOUS REPORT has been circulated in some sections of New York, particularly in the Jewish districts on the East Side, to the effect that Mississippi River catfish were being canned and shipped to this market under the brand of Pacific Coast Salmon. This rumor has resulted in some injury to trade, as the Hebrews, for religious reasons, are prohibited from using catfish, and those who did not know that there is a decided difference in color and texture between these two fishes, refused to buy salmon in any shape. It is needless to say that there is no foundation of truth in this report, as salmon and catfish are about as near alike as woodchuck and alligator.

COTTON UP AGAIN.—Unusual activity marks the cotton market here. On the day after New Year speculative transactions on the Exchange amounted to more than 350,000 bales. The prospect that Chinese affairs will be soon settled sufficiently to allow a general extension of trade there, is an encouraging feature. While there are indications that the crop in the South will be larger than at first reported, yet the manufacturing demand in all parts of the world is so extensive that there is no prospect of any serious drop in price.

THEATERIZED BOYS.—A popular theater in New York charges a gallery admission of only 15 cents. Some time before the gallery is opened at night, a line, often several hundred men and boys, mostly boys, forms on the sidewalk. They are newsboys, bootblacks, and ragamuffins of various types. Some are under 12 years of age, and ought to be in bed at that time. Others are older, but vile food, dirt, lack of sleep, and a general knocking around on the ragged edges of life have marked them, and they are stunted and withered up like a potato that has grown a yard or two of sprout in the cellar. Their education is picked up on the streets, and flavored with a little stage comedy or tragedy, as they are able to scrape up the price of a gallery seat. To many of them, home, if they have any, is a place that they don't care for, where they are not wanted, and from which they get no encouragement. They are an uninviting crowd, and the average person who passes this line will put them down as tough cases, candidates for the gutter, jails, prisons, asylums and early graves. Yet, some of these boys have as good material in them as there is in the world. Now and then somebody gives one a bit of encouragement; hope starts to grow in him; he gets his head above the surface and climbs into better things at surprising speed. An illustration of this is seen in Governor Brady, of Alaska, who was once a ragamuffin, kicked around the streets of New York, and sleeping in barrels and boxes, until he was picked up by some one, put on a farm and given a little chance. He pushed ahead; went through Yale College, and is a most useful citizen. Whoever gave him the start made a good investment. W. W. H.

PRICES FOR CROPS.—Wheat, 72 cents, but very little in farmers' hands. Rye, 46 cents per bushel; was a good crop; about half a crop in farmers' hands yet. Storehouses full; no cars to ship in. Apples, 50 to 75 cents per bushel, and are shipping in from outside markets now. Potatoes, 32 cents per bushel; cellars full and no cars to ship in; there has been no competition in buying here, as cars were so scarce. A large amount has been frozen in pits. Butter, 18 cents per pound. The market is well supplied at present, and prices are likely to go lower. Eggs are 22 cents per dozen, not enough to supply the market. Poultry market is overloaded, selling at five cents live, or eight cents dressed. I have been offered 75 cents per bushel for my Ben Davis apples delivered in February. There were a number of carloads bought here in the Fall for 20 cents per basket. The home market pays. W. B.

Stanwood, Mich.

Mother's Love

Is boundless. Yet it is utterly helpless to give strength to the child born with a low vitality. The time to give strength to the child is before birth and to impart this gift the mother herself must be strong. Dr. Pierce's Favorite Prescription gives strength to mothers. It preserves them in robust health in the months before baby comes. It practically does away with the pains of motherhood, and enables the mother to endow her child with a healthy body and a happy disposition. "Favorite Prescription" contains no alcohol and is absolutely free from opium and cocaine.

"I consider Dr. Pierce's Favorite Prescription the best medicine made," writes Mrs. Mary Murdock, of 220 Taylor St., Topeka, Kansas. "I know it has no equal. I am the mother of ten children and only one living—the tenth one. She is one year old and is as well and hearty as can be. She is a beauty. Of my other babies, some were born at right time, but dead, others were premature births; one lived to be one year old but she was always feeble. I tried different doctors but none of them could tell what my trouble was. I was examined by surgeons but they found nothing wrong. I did not know what to do, so I thought this last time I would try Dr. Pierce's Favorite Prescription. I took it the entire nine months and now have a fine baby girl, and I can not praise your medicine enough for the good it did me."

Dr. Pierce's Pellets cure heart-burn.

Live Stock and Dairy

AILING ANIMALS.

ANSWERS BY DR. F. L. KILBORNE.

Heifer Fails to Milk.

A heifer I raised came in with her first calf November 30, but has not given any milk from two teats on the right side, front and back. She has a fine udder, well developed, and was raised from good stock. I have tried everything to remedy the wrong, but have thus far failed. Would she be likely to come to her milk if she is kept till she comes in again? L. A. W.
Milford, Conn.

Cases of this kind occur occasionally, but not commonly, in which one or more quarters of a heifer's udder will fail to secrete milk. The trouble may be due to lack of development in those quarters, or to previous inflammation from some injury to that quarter. By rubbing and stripping of the dry quarter at each milking you may yet be able to stimulate a flow of milk. If they fail to come to their milk this season, they may do so at the next calving, if there are no special indications to the contrary; but if they fail then, it would be useless to keep her longer.

Whole Rye for Horses.

Will you inform me whether there would be any risk attending the feeding of unthrashed rye straw to horses? I mean from the awns. These are quite fine as also is the straw, the seeding having been heavy.
Washington, N. C. B.

The risk in feeding unthrashed rye to horses in moderate quantity is not very great, and yet it cannot be said to be safe. The awns are liable, and do occasionally, cause serious trouble in the mouth and throat, as well as in the stomach and intestines. It would be safer to have the rye thrashed and to feed the straw without the chaff, which would contain the greater portion of the awns. The rye itself could be fed mixed with other grain either whole or ground, but it ought not to be more than one-third or one-half of the grain ration.

R. N.-Y.—Some farmers in New Jersey feed whole rye to horses in the following manner: The straw and heads are run through a cutter and moistened. The ground feed is put on this cut rye. This plan works well. Such farmers believe that the awns or spikes scratch off bots from the horse's stomach.

Scratches, Malanders and Thrush in Horse

What will cure my horse? He is coming eight, has breakings out on his legs, which some people call scratches. I can get them to heal, but they will crack open again, particularly on the approach of cold weather. Behind the front knees is the worst place. He also has thrush in three feet and the bottoms of his feet are dry and cracked. E. S.
Lionville, Pa.

When this scaly affection appears under the fetlock it is known as scratches, on the back of the fore legs in the bend of the knee as malanders, and back of the hock as sallenders. There is evidently a constitutional tendency in this horse to these skin diseases, which may be due to unsuitable diet, want of proper care and cleanliness, or to disorder of the liver, kidneys or other organs. There is no permanent cure for these cases, unless the cause can ascertained and removed. They may be apparently entirely cured, only to recur whenever the conditions are favorable. Treatment should be both local and general. Internally I will advise a course of iron and arsenic. Give one teaspoonful dry pulverized sulphate of iron and a large tablespoonful of Fowler's solution of arsenic in feed twice daily. After two weeks omit the iron (containing the arsenic) for a like period, and then repeat as before. Continue for one or two months. A laxative diet should be fed, consisting in part of bran mashes, silage, roots, or other green feed sufficient to keep the bowels moving freely. If there is constipation give half ounce doses best aloes every three or four days until relieved. Locally, use benzoated oxide of zinc ointment twice daily to soften and heal the cracks. If necessary to wash, use warm castile soapsuds, after which rub dry. Wet the legs only when necessary. If thickening of the skin remains, apply mercuric or iodine ointment once a week.

Post-Partum Paralysis in a Cow

I have a two-year-old heifer that recently calved. The heifer evidently had a very hard time, as the calf was very large. The calf was dead when I found it, but seemed to be fully matured. The heifer seems to be all right, except that she cannot use her hind legs enough to stand. She eats and drinks as well as ever, but seems to be very weak. Last Spring I had a cow in the same condition as this heifer. We tried slinging her up, but she would not stand on her hind feet. She would lie with all her weight in the sling, apparently very uncomfortable and in a great deal of pain. I finally killed the cow as there seemed to be no help for her. Both cows were in good condition. I have fed the heifer two quarts potatoes with three pints of corn and oats since taking in from the meadow.
Willsborough, N. Y. B. C. F.

Partial paralysis not infrequently follows a difficult parturition, as in the present case. The cow should have had an active blister applied over the loins, and followed by hypodermic injections of strychnine or dram doses of powdered nux vomica three times daily. Ounce doses of sweet spirits of niter, or alcoholic stimulants can be given to advantage and repeated every four hours. The animal should be provided with a warm comfortable bed, or blanketed if necessary, to keep her warm, and turned from side to side several times daily. If there is constipation give pint doses of raw linseed oil night and morning until relieved. Feed a nutritious, laxative diet, such as bran mashes, boiled flaxseed, oatmeal or oats, or even milk and eggs. Cases of this kind ought always to be placed in charge of a competent veterinarian wherever practicable. Complications, especially retention of urine and inflammation of the womb, are very liable to arise, which can be recognized and successfully treated only under the personal direction of the veterinarian.

GREEN FIELD IN DRY TIMES.

We said last Fall that thousands of farmers in this country have been driven to the practice of soiling or cutting green fodder for their cattle. The last few seasons have been particularly dry, and again and again pastures have dried up, meadows have failed to yield average crops, and the result is that many farmers were caught in two ways. In the Summer, when their cows ought to have been giving an abundance of milk, they failed because there was not succulent food for them. The farmers were either obliged to dispose of some of their cows, feed hay or corn that was needed for Winter feed or else witness a shrinkage of 25 per cent or more in the milk yield. Again, when Winter came they found themselves with half-empty hay mows, and a shortage of dry fodder. Most farmers regard these dry feeds as little short of a curse. Yet they may prove blessings in disguise if such farmers will heed the advice and experience of those who have found better ways of feeding stock. The soiling system consists in cultivating crops rather than raising them as pasture. Under this system a succession of green crops is planted and cultivated, so that one follows the other through the season. It is well-known that a cow at pasture destroys more feed than she eats. It is also evident to many farmers that a greater amount of fodder can be grown on an acre of land that is plowed, fertilized and well-cultivated than will grow on that same acre in natural grasses. Putting these two facts together the soiling farmer plows his ground, plants a succession of crops and carries them to the cow. If any of the crop is left after the suceeding crop is ready, that portion is either cured for hay or put into the silo. This system promptly carried out enables a farmer to laugh at the drought. His cows are well supplied with fodder, he can keep more stock than ever before to the acre, and his Winter supply of feed is always sure. These are the facts, yet comparatively few farmers understand them. A book entitled "Soiling, Ensilage and Stable Construction," by F. S. Peer, gives the experience of a practical man, and is, in our opinion, the best thing of the sort that has ever been printed. It tells how to start the soiling system and how to keep it up. It tells how to make good silage, how to construct or make over a farm stable. The book costs $1, and we can supply it at that price. It ought to be worth $100 to any man who will study it, and then go and write his studies with green ink upon his fields.

From what I can learn a carload of young cows could be purchased in this vicinity at prices ranging from $20 to $30; old cows at a less price. It would probably take about two days to pick them up.
Breesport, N. Y. J. F. M.

SOME HABITS OF HENS.

Those Lively Buff Leghorns.

Regarding those Buff Leghorn pullets mentioned on page 779 of last year, we are too apt to regard the fundamental distinctness between breeds as a matter of origin mainly, when the truth is that it is chiefly the product of acquired habit. It has been assumed that Game crosses are accountable for increased liveliness and excitability of the Buff Leghorns, as contrasted with their White or Brown cousins. But these characteristics are the direct reverse of the Game's well-known character, True, the Game fowl moves with unmatched quickness, but it moves but seldom; while the Leghorn is constantly in motion. The Game has nerve, while the Leghorn has nerves, a distinction which places them at the utmost as regards temperament. We are accustomed to sum up the Leghorn's distinct character by reference to the sunny climate of their original home. But let us get down to bed-rock by assuming that from temperamental differences the food consumed goes to make blood mainly in the one instance, and in the other to sus tain nerve power. Both the Leghorn and Game have highly organized nervous systems, as distinguished from the Dorking, the best phlegmatic example among fowls, whose forces preponderate in the building up of much flesh rath r than in products to be given off. The Leghorn's temperament we may describe as nervous-sanguine, the Game's as nervous-athletic. The Game's demeanor is one of the self-assurance of the lymphatic temperament joined to capacity for great and sustained nerve activity when occasion arises, its true character being of the quietest, to distinguish it from the pronounced active habit of the Leghorn and its crosses.

The Leghorn's trait of rapid blood making is its predominant one. We may regard this as the natural concomitant of its active habits. As eggs exist first as blood, a good blood-former should prove to be a good egg-producer. The occasional poor layer found among Leghorns, though generally "scary" enough indicates by the poorly developed comb that its wearer is a poor assimilator of food, as the size of the comb within breed limits is a reliable index of vigor, and the comb grows large, or vice versa, according to the blood pressure at the period of development. Coming now to the question why the Buff Leghorns in question are wilder than White or Brown specimens under similar conditions, the answer inevitably is, because of being a truer Leghorn, judged by this criterion of temperament. Granted a Buff Leghorn is a composite fowl, I hold that many strains are doubtless composed mainly or wholly of White or Brown Leghorn blood. And who knows what in turn these are comprised of? The fanciers are at it untiringly trying the effect of every conceivable advantage of certain crosses to enhance some particular external feature. And it is safe to infer that our Leghorns contain more Spanish and Game blood than any other extraction. Why one color of Leghorns alternates with another in early maturity is a probable matter of several combined influences. Had the flocks all been of one color and breeding records kept the correspondent would doubtless have found one sire's get to surpass others in this respect. Full size is attained before maturity, and what tends to reduce the size of the pullets, other things being equal, will allow of quicker things being equal, will allow of quicker are going to be of more than their wonted size to account for their backward development. Again, as vigor is the final condition upon which usefulness as layers depend, however much stress we may put upon good feeding or heredity, perhaps these Buffs are not so vigorous as their White or Brown neighbors.

F. W. PROCTOR.

WET BREWERS' GRAINS.

In THE R. N.-Y. issue of December 22 a correspondent asks about wet brewers' grains for fattening chickens, saying that he can buy them at eight cents per bushel. While I indorse what you say in regard to their use for fattening purposes, I would like to call attention to their cheapness at eight cents per bushel where a protein feed is required. I have been feeding them to laying hens for some time in a mixture of 10 parts of the wet grains, four parts of cornmeal and one part of animal meal. This I give warm at noon—in the morning they have wheat in the sheaf, and at night some whole corn. The fowls keep in thrifty condition and lay well. If the brewers' grains are fully saturated with water they will weigh 70 pounds per bushel, and it is on this basis that the published analyses are made. But as they come to us they weigh just about double what the dried ones do, or 42 pounds per bushel. Regarding the protein content only the dried grains, at present prices, give us protein at six cents per pound; while wet ones at eight cents per bushel of 42 pounds give it at 2¾ cents per pound. This difference will pay for hauling some water, although as to extra hauling that is offset in my opinion by extra work in carrying water for the dried grains. Wheat bran at present high prices gives us protein at 7½ cents per pound, and oats gives it at nine cents per pound. I do not take into account the carbonaceous elements of the feeds mentioned. If we are after those, corn is, as you say, the thing to get. During cold weather the wet grains invariably come in good condition.

New Jersey. G. D.

WARMING THE DUST BATH.

A recent writer speaks of a warm dust bath for hens with a lamp under it. How is this arranged, and what is it for?

It is noticeable that all poultry instruction books emphasize the importance of providing a Winter dust bath for hens. It is also noticeable, especially to the disappointed novice, that the hens very rarely, if ever, use them. Certainly never when the house and the weather are very cold. It is a case of bringing the horse to water. He will drink if he wants to, and he won't if he doesn't. You cannot persuade him; and you cannot persuade a hen that it's fun or a good thing to wallow in cold dust, in a cold room. But if you will cut a hole in the bottom of the dust box and insert an old dishpan, wash-basin or what not, bottom side up in it, and raise the box off the floor so the lamp will slip under the pan, and warm the earth, it is surprising what comfort they will thus take in their bath, and the good results that follow. The space under the box where the lamp is, should be enclosed to prevent accident. Wire netting or laths is best, so as to admit to the lamp plenty of fresh air. Kerosene exhausts the oxygen so fast that a tight compartment is unsafe. The smallest-sized kerosene cooking stove, costing about 60 cents, is safe and satisfactory. W.

OATS FOR HENS.—One doesn't relish taking back what he has written particularly after the types have told it to so many people; but it is said that "confession is good for the soul." You see, there isn't much use of having a hobby unless one can ride it sometimes. Now, it has long been a hobby of mine that oats are a good feed for hens, but dangerous if fed carelessly or in the usual dry condition. Therefore, when I was told by reliable witnesses that one man had lost 75 or more hens by feeding them dry oats, I at once believed it all, and proceeded to portray the awful lesson. Witness my reward! Not only do poultry-keepers insist that oats are all right, but hens of the flock where I got my evidence keep right on dying off just the same after they are fed no more oats. The ungrateful things! I have carefully examined that "hobby", however, and I find it in good working order. My hens get one or two feeds a week of oats, but the oats are almost invariably boiled and fed warm, not hot. H. H. L.

SHEAF OATS.—A writer in Hoard's Dairyman has this to say of oats cut green and cured like hay: "Do you know that sheaf oats are one of the very best Winter feeds for dairy cows? When there is no silage on hand or none at all grown they form one of the very best substitutes. Sheaf oats, fed to cows in Winter, have a loosening effect almost equal to silage or roots. Cows fed on sheaf oats will never be constipated as they are when fed on straw or hay. I hardly know why this is, but the fact so remains. When there is no silage, cows fed largely on sheaf oats must not be fed too many roots, or they will scour. If a bushel of mangels or turnips is fed daily to cows getting principally sheaf oats for roughage, the results will be bad; this I proved conclusively last Winter."

PEARL GUINEA FOWLS.—I would like information in regard to Pearl Guinea fowls; how to distinguish male from female, how many hens to keep to one male. W. M. T.

Monroe Co., N. Y.

THE male Guinea has larger watties than the females and is usually rather heavier bodied, and in the case of the Pearl variety they usually have white on the breast, which is seldom seen on the female. One male is sufficient for from six to 10 hens. J. E. S.

POULTRY NOTES.—My hens average only about one-third to lay in Winter. April-hatched P. Rock pullets start in to lay in October. I do not house pullets until compelled by snow, giving them the run of the premises as long as possible. Moulting season varies largely in different individuals and different ages; the older birds sometimes do not get their new plumage till Winter. Raw cut bone is most valuable as an egg producer. Then, too, the grain thrown into the dirt in the scratching pen, which they have to work for, is excellent, activity producing cheerfulness and health.

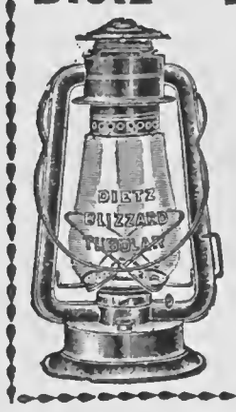
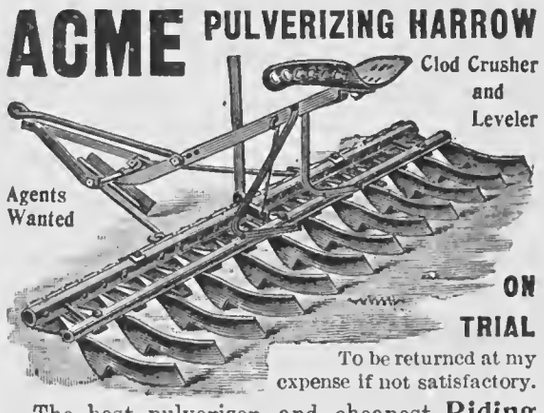
Dietz "BLIZZARD" LANTERN Cold Blast



THIS LANTERN is the culmination of a vast deal of experiment, and it is offered as something *extra good* in the Lantern line. This Lantern is made on the "Cold Blast," principle and is fed exclusively with cold air, that which comes from above, being taken in through openings between the two rings at the top.
This system of air supply greatly stimulates combustion with the resultant extra volume and intense whiteness of its light. It is fitted with an entirely new and most effective device for raising and lowering the globe, which also locks the burner in position.
If your dealer does not keep it, we will send one to you for $1.50, expressage paid.
The Catalogue, which we mail free, will give you an idea of the extent of our line of Lamps and Lanterns.
R. E. DIETZ COMPANY, 87 Laight Street, New York.

ACME PULVERIZING HARROW
Clod Crusher and Leveler
Agents Wanted

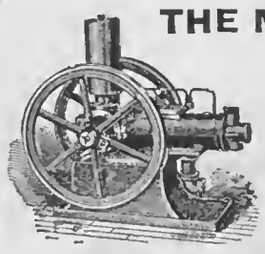


ON TRIAL
To be returned at my expense if not satisfactory.
The best pulverizer and cheapest **Riding Harrow** on earth. We also make walking Acmes. The Acme crushes, cuts, pulverizes, turns and levels all soils for all purposes.
Made entirely of cast steel and wrought iron—**indestructible.**
Catalog and Booklet, "*An Ideal Harrow*," by Henry Stewart, mailed free.
Free on board at New York, Chicago, Columbus, Louisville, Kansas City, Minneapolis, San Francisco, etc.
DUANE H. NASH, Sole Mfr.,
Millington, New Jersey, and Chicago, Ill.

9 CORDS IN 10 HOURS

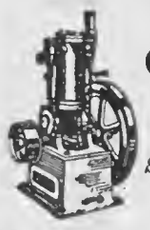
BY ONE MAN. It's KING OF THE WOODS. Saves money and backache. Send for FREE illus. catalogue showing latest improvements and testimonials from thousands. First order secures agency.
Folding Sawing Mach. Co. 55 N. Jefferson St., Chicago, Ill.

THE MIETZ & WEISS
Kerosene Engines



Cheapest and Safest Power known. For Pumping water, grinding corn, separating cream, sawing wood, *and all power purposes.* Send for Catalog.
A. MIETZ,
128 Mott Street, New York

CHARTER Gasoline Engine

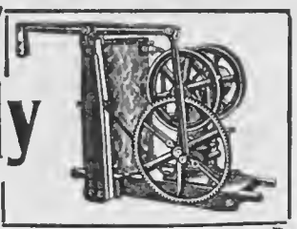


USED Any Place By Any One For Any Purpose
Stationaries, Portables, Engines and Pumps, Hoisters
State your Power Needs.
Charter Gas Engine Co., Box 26, Sterling, Ill.

FARM POWER.

Our line of Vertical Engines are particularly desirable for Farm and Portable work; they are compact, strong, simple and durable. They can be set up in the barn with perfect safety, and any man can run and take care of them. Our Special Offer for this month is a wood-sawing outfit. It will cut your and your neighbor's wood, and be the means of putting many dollars in your pocket. Better get particulars.
R. N. DIRIGO ENGINE WORKS, Portland, Me.

WEBSTER'S "Handy Man" GASOLINE ENGINE



with walking beam Pump Jack and gasoline supply tank, all on one base. It is the handiest, most complete, economical and efficient small power made. Engine 1½ actual h. p. By disconnecting pump jack and putting belt on fly wheel pulley it is ready for **grinding, shelling, cutting feed, separating cream, churning, cutting green bone**—anything not requiring more than 1½ h. p. Costs little for fuel and requires no expense to operate. We also make other sizes of vertical and horizontal engines for all purposes. Send for large catalogue.
Webster Mfg. Co., 1091 West 15th St., Chicago
New York office 38 Dey St., New York, N.

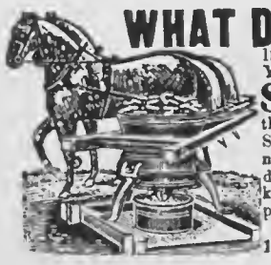
LAND DRAIN TILE

(Car-loads or less).
Sizes, 2, 2½, 3-inch and up to 15-inch.
WILLIAM T. LEGGETT & CO.
1025 Liberty Avenue, Pittsburgh, Pa.

STEEL ROOFING THE ONLY TOOLS YOU NEED.

5000 Squares
BRAND NEW STEEL ROOFING
Bought at Receivers Sales, sheets either flat, corrugated or "V" crimped. Price per square of 10 x 10 feet or 100 square feet..... $1.75
No other tool than a hatchet or hammer is required to lay this roofing. We furnish FREE with each order sufficient paint to cover, and nails to lay it. Write for Free Catalogue No. 57 of general merchandise bought by us at SHERIFF'S and RECEIVER'S SALES.
"Our Prices are ONE-HALF of others."
CHICAGO HOUSE WRECKING CO.
West 35th and Iron Sts. - Chicago.

WHAT DO YOU FEED?



It will go farther if you grind it. You can do it much better with the
Star Feed Grinder
than with any other mill made. Shortest sweep. Quickest worker. It never chokes. Grinds whole ear corn dry, damp or frozen. Grinds all kinds of grain. We make steam power mills, too. Circulars free.
STAR MANFG. CO.
13 Depot St., New Lexington, O.

VICTORY FEED MILL
Oldest and Best Grinding Mill Made

Will crush and grind corn and cob and all kinds of grain, mixed or separate. Grinds faster, finer and with less power than other mills. Are built strong, well made of good material, and will last a lifetime. Small size adapted for wind and tread power. Made in four sizes for 1, 4, 6 and 10 H. P. Free Catalogue
THOS. ROBERTS,
Box 92, Springfield, O.

BUCKEYE Feed Mills & PowerCombined

Not only grind corn and cob and all other grains single or mixed, but they also supply power for shelling, cutting feed, sawing wood, pumping water, &c. at the same time. Fast, large capacity and durable. Send at once for Catalog S, Mailed free.
STAVER CARRIAGE CO.,
76th and Wallace Sts., Chicago.

350 BU. A DAY

with the Wolverine No. 805 Mill. Grinds ear corn and all other grain fine or coarse. Has shake feed, burrs open and let nails or hard substance through. Furnished with or without ear corn crusher and elevators. Made in 3 sizes for 2 to 15 h. p. Can be run with power wind mill.
CAPACITY guaranteed greater than any mill made, because crusher and grinder run on separate shafts, relieving all friction.
SHIPPED ON TRIAL. If it don't do more and better grinding and is'n't the most complete mill and the biggest bargain you ever saw, return it at our expense. 60 kinds of Grinders for all k nds of work.
ALSO Horse Powers, tread and sweep, Gasoline Engines, Wind Mills, Tanks, Pumps, Feed Cookers, Scales of all kinds. Send for Free latest and largest implement catalogue ever printed.
Marvin Smith Co., 53-59 N. Jefferson St., Chicago, Ills.

Cider Machinery.—Send for catalogue to Boomer & Boschert Press Co., 118 West Water St., Syracuse, N.Y.

ICE PLOWS $16.50. Also ICE TOOLS.

Plants the Seeds—Cultivates the Plants.

That is the shortest way to tell what this "Planet Jr.," No. 4 Combined Seeder and Wheel Hoe does. Sows in drills or drops in hills at any distance. Opens the drills, sows, covers, rolls and marks the next row at one operation. Being very fast it gets all the seed in just when the ground and all conditions are at their best. All plants get an even start. Can be changed quickly to cultivator, hoe, rake, plow, hiller, etc. Has attachments for all these uses. Guaranteed satisfactory. Price low.
The "Planet Jr." line comprises also Wheel Hoes, Horse Hoes, Pivot Wheel Cultivators, Orchard Cultivators, Celery Hillers, Markers, Levelers, Potato Diggers, Sugar Beet Seeders and Cultivators, etc. Prices on all are largely reduced for 1901.
Send for our 1901 "Planet Jr." Catalog. It tells all about our goods. Shows by 16 full page photographic illustrations how they are used in this and other countries. We have already issued 350,000 and will issue more if necessary. We mail it free.

THE RURAL NEW-YORKER

A JOURNAL FOR THE SUBURBAN AND COUNTRY HOME

VOL. LX. No. 2660. NEW YORK, JANUARY 19, 1901. $1 PER YEAR.

ALFALFA FOR NEW YORK STATE.

ITS GREAT VALUE AS A STOCK FOOD.

Ought to Be More of It.

AN OLD PLANT.—There is probably no problem of greater interest to the farmer than the production of forage for the farm animals, and especially is this true of the dairyman. At the present time he must face low prices for his products, and it becomes necessary for him if he would receive a fair profit from his business, to reduce the cost of production to the lowest limit possible. When he begins to consider this matter he is at once faced by the problem, "What can I raise that will produce a larger yield per acre, at less expense of labor and money?" It is not my purpose to enter into a general discussion of fodder plants, but to call attention to Alfalfa, which is one of the most productive. While the raising of Alfalfa is comparatively new to us, it has been grown many years in other parts of the world. It has been grown in Greece for nearly 3,000 years as a forage plant. The Romans esteemed it very highly, and Columella writes that it yielded four to six crops a year. In France the plant is known as Lucerne, and in Spain as Alfalfa. It is grown quite extensively in southern Europe. From Spain Alfalfa was introduced into South America and then by way of Mexico to California, where it still retains the Spanish name. While in California and many of the Western and Southern States it is grown quite largely, it has never been much cultivated in the Northern States. In the Eastern States it was introduced from Europe, and is generally known as Lucerne. The Alfalfa from California is said to withstand drought far better than the Lucerne of Europe, while the Lucerne withstands cold Winter better than Alfalfa.

A FAMILY AFFAIR AT MILKING TIME. FIG. 13.

GOOD WORDS FOR IT.—It has been grown successfully for the past 16 years at the New York Experiment Station, and has given large yields of green forage and hay per acre, which has been proven to have a large feeding value, and to contain a much larger per cent of digestible matter than Red clover. The soil at the Station is a stiff clay. The following yield reported for 1886, from seed sown the year previous will give some idea of its productiveness: June 11, yield at rate of 5,166 pounds dry fodder per acre; July 19, 14,385 pounds green fodder per acre; August 18, 11,795 pounds; September 23, 8,172 pounds, or a total for the season of 47,636 pounds of green forage, equal to 23 tons, 1,623 pounds. As to its feeding value, we quote from the year-book of the United States Department of Agriculture for 1896: "One hundred pounds of freshly-cut Alfalfa contain at time of flowering 2.82 pounds of dry matter, and of this the amount digestible is 3.89 pounds of crude protein, 11.2 pounds of carbohydrates and .41 pounds fat, so that the nutritive ratio is 1 to 3.1. One hundred pounds of Alfalfa hay contain the following digestible constituents: 10.53 pounds of crude protein, 37.33 pounds of carbohydrates and 1.38 pounds of fat, with a nutritive ratio of 1 to 38. Alfalfa hay is much richer than clover hay, containing for every 100 pounds 54.5 pounds of digestible substances, of which about 11 pounds are protein. The relation of the crude protein of Alfalfa hay to that of Red clover is as 11 to 7." Altogether Alfalfa is one of the best forage crops grown in the United States, and is adapted to cultivation in a greater range of latitude than Red clover. Its successful cultivation depends largely upon the character of the subsoil. Alfalfa will not do well on any soil, no matter how rich or well prepared, if it is underlaid by rock or hardpan near the surface. Neither will it stand flooding with water; good drainage is absolutely necessary. It will not stand close pasturing because the new growth is sent out from the top of main root, and if this crown is destroyed the root soon dies. To bring this matter a little nearer home I will give some of our experience with this plant, which has been most encouraging.

PRACTICAL EXPERIENCE.—On May 31, 1893, we plowed a piece of land that had been in corn the year before, and contained 150 rods of land. The soil was variable and full of weeds with some Quack grass; not a good chance for Alfalfa, but it was the best we had at the time, and so it was fitted as well as we could do it with the tools at hand, and seeded with 20 pounds of seed on June 2, lightly harrowed in. The weather was favorable, and it soon germinated and started to grow, so that by August 1 it would average 12 or 15 inches high. We harvested a light crop about August 15, and let the remaining growth remain on the ground during the next Winter. During the season of 1894 this piece was mowed three times, and gave an estimated yield of 5½ tons of hay, with a nice growth left on the ground to go into the Winter. From these results we determined to try some more, and on May 23, 1895, we seeded a piece of about one acre adjoining the other. This time we put on 20 pounds of Alfalfa seed, and at the same time one-half bushel of oats, sown broadcast and harrowed lightly. The seed started well, and about the middle of August, when the oats were in the milk, we cut from this piece nearly two tons of hay, weighed at time of drawing from field. The first piece was cut three times again in 1895, with a yield of six tons of hay. For the season of 1896 both pieces were cut three times, with such a satisfactory yield that on May 20, 1897, we seeded another strip, using seed at the rate of 20 pounds per acre with one-half bushel of oats. This last seeding was harvested in August, when the oats were in the milk and the Alfalfa about 15 inches high, giving a yield equal to 1½ ton of hay. The other two pieces were cut three times this season, with a considerable increase of yield. During the season of 1898 the three pieces were cut three times, with a yield that taxed the capacity of our barn to the utmost, besides feeding two horses and a cow all Summer, and about one-half acre was cut in June to mulch strawberries. A growth of one foot or more went down on the ground at the beginning of Winter. We have kept two horses and a cow, and they have been fed almost entirely on Alfalfa since 1895. They are kept in the barn all the year round. At the end of 1896 we had several tons of hay left, and at the end of season of 1897 a large mow full. Note the fact that as yet we have been to no other expense than that of seeding the ground, except to gather the crops.

ITS FEEDING VALUE.—Now as to its feeding value. Our experience would seem to agree with Prof. Cottrell, of the Kansas Experiment Station. He says that good Alfalfa hay contains over 86 per cent as much protein as wheat bran; that the amount of protein in Alfalfa varies from 9.9 per cent when it is poorly cured to 16.2 per cent when the best of care is taken. Average bran contains 13 per cent of digestible protein. With good handling, therefore, Alfalfa hay can be made, which is worth more than its weight of bran. In Colorado, tests show that the leaves of Alfalfa hay contain over 14 per cent digestible protein, so that a ton of them has a feeding value of 2,400 pounds of bran. Alfalfa, like clover hay, when roughly handled, loses many of the leaves. As the best feeding value is in the leaves, we can readily see the reason for care in curing the hay. We have produced a crop of heavy yield and high feeding value. Are we robbing the soil? On the prairie lands of the West, where Alfalfa has been raised for some time, they have found that the soil is actually richer after growing Alfalfa for a few years, and will produce larger crops of grain. The reason of this probably is because its roots go very deep into the soil, and pump up the mineral elements from the lower strata that could not be reached by other crops. This is another point in favor of Alfalfa; it does not impoverish the soil. Then again, the manure made from

feeding the hay has a considerable value if properly handled, and by this means we can save a large part of the fertilizer bill, as the nitrogen is the most expensive element to buy. But above all others the best feature of Alfalfa is that it will furnish green fodder for almost the entire Summer. There are some other points that might be mentioned, but enough has been said to show some of the possibilities of this crop. It is being raised in many parts of this State with good success, and might be in a great many more, if the farmers would give it a fair trial. In sowing Alfalfa always use new seed, as old seed will not germinate so well. If the work is properly done success is quite certain. The coming Spring I expect to sow some Turkestan Alfalfa, as it is said to withstand drought much better, and will report upon it later.

Tompkins Co., N. Y. D. R. P.

CUTTING AND LOADING ICE.

Many articles have been written for the farm papers describing methods of harvesting ice on a large scale. The plan described below is simple, practical, and two farmers can work together and put up eight or 10 loads of ice in a couple of days. They can "change work" with each other, and thus fill two small ice houses at almost no expense in money out. We know how this plan works from personal experience during the last 15 or 20 years. We are obliged to go over three miles away from home for our ice in order to secure a pure article. It is better to haul on sleighs, but we have occasionally been forced to use the wagons for want of snow. For cutting the ice we use a regular cross-cut champion-tooth saw, taking a hand off from one end. A square (see A, in Fig. 14), is made of a piece of six-inch board, with brace attached to make it rigid. This, with a 16-foot two-inch plank, is used for laying out and marking off the squares of ice. Fig. 14 shows a square hole cut, with all but three cakes of ice removed. At the left are eight more cakes marked out ready for cutting. The saw is waiting for an ambitious manipulator. The cakes should be cut as nearly straight as possible, but many operators find it difficult to keep the saw from running to one side, especially when the ice is thick.

The ice derrick is our own invention, and is more convenient and safer to use for lifting the cakes from the water and hoisting into the sleigh or wagon, than any other plan we ever tried. Use two poles to make the derrick and sweep. The upright, B, may be cut from a piece of 2x4 hardwood. It should be about 12 or 14 feet long, well braced at the base. The bottom should be smooth in order to slide freely over the ice. The sweep, C, should be about 16 feet long, with a rope attached to each end. It is pivoted on top of the upright, B, one-third or more projecting over, where the ice tongs are attached. The other two-thirds, with the rope, D, give plenty of leverage for lifting the heavy cakes. After a season of cutting cakes the two icemen proceed to lift out and load up. One seizes the togs and catches on to the floating cakes, while the other presides at the rope, D. The derrick is quickly given a slide just far enough to swing around and hoist the cake into the sleigh box.

A load is quickly made ready for transportation to the ice house by means of this derrick. There is less heavy lifting and straining, with the attendant danger of getting wet or slipping into the water, as when one stands on the edge of the ice and lifts the cakes out by main force. There is also less danger of slipping and being crushed by a heavy cake of ice when loading into the sleigh. The derrick costs less than $1 to make, can be set up or taken down at a moment's notice, and, if cared for, will last for years. It should be made strong enough to handle the heaviest cakes of ice. J. H. BROWN.

WHAT A CEMENT STABLE FLOOR DOES.

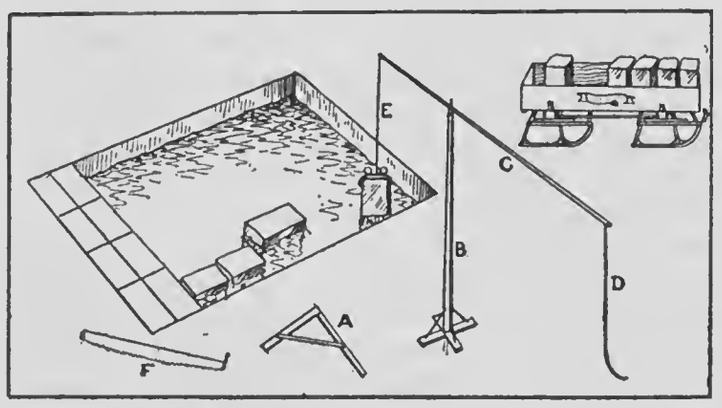
In your issue of May 19, 1900, you answer a question from me in regard to cement manure pit with large cut furnished by L. A. Clinton, of Cornell University. The manure pit is an accomplished fact, as well as a cemented stable 14x30; manure pit 12x30, all three inches thick. Two coats, first small gravel up to the size of Black walnut, one of cement to five of gravel; second coat coarse sand screened from the gravel, one of cement to three of sand. I did not put on the smear coat of cement for a third coat, as I thought it would make it too slippery. Between six and seven barrels of cement (Portland), 400 pounds each at $2.60 net per barrel, were used. My hired man and myself were the high-priced masons who did the civil engineering and labor at $1 per day. Cost, including my time, about $25. Fig. 15 shows the whole thing.

Now for results in water (editorial page, December 29). I am saving every day more than 15 cents' worth of urine which but for the cement would have gone to waste, that is $4.50 per month. So that the first Winter of its use I will have received my money back, to say nothing of gain through added warmth and manure being housed and worked over by hogs like at Hope Farm. Now let the man with horse stable who asked about cement for a covering try Portland cement one part, coarse sand three parts and two inches thick; second coat cement and sand equal parts, one inch thick, and I do not believe it will crack. You gave me a little primer science (privately) once on a time which you ought to keep in print somewhere in every issue for the benefit of beginners like myself. The cement floor is a not unnatural sequence to the knowledge thus obtained. A 16-quart pailful of urine is worth nine cents. At State College, Pa., in 50 days two cows gave results like this: Value of manure, $3.56; urine, $6.06, a trifle over 1 5-7 in favor of liquid. Stop up those augur holes in your cow-stable floor, and do a little figuring, and you will commence to see that cement and a little labor will accomplish something. E. D. R.

Crooked Creek, Pa.

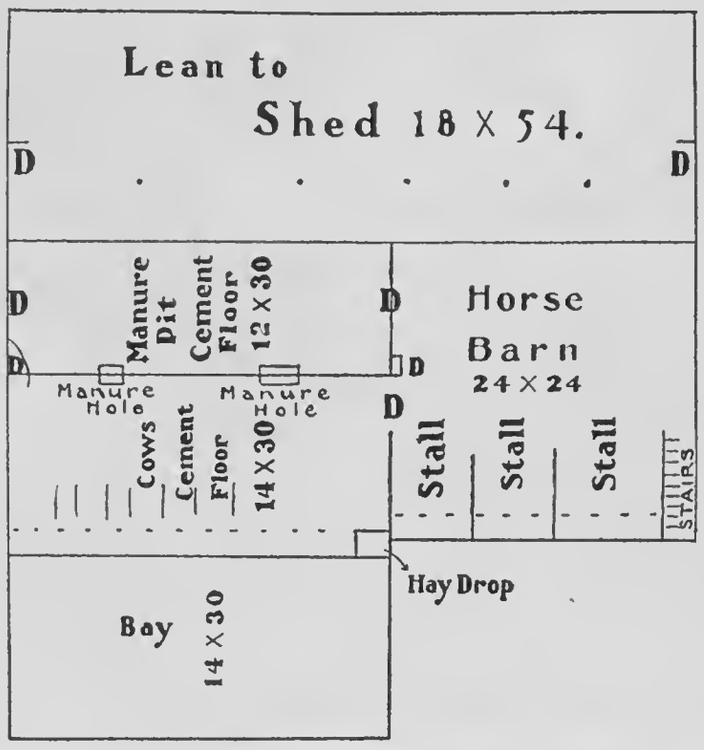
FARMING DIFFICULTIES IN NEW YORK STATE

In connection with the farmers' reading course of this institution, which is essentially a correspondence



CUTTING AND LOADING ICE. Fig. 14.

course, very many interesting letters are received. The object of the course is to help the farmer to a better understanding of the business of farming and the principles of agriculture. Specific difficulties then come up, as well as troubles of a general nature. In looking over the list of obstacles which beset the farmer, one finds that they are divisible into two general classes, those that pertain to the farm, and those that pertain to the orchard and garden. One finds, again, that the farm troubles are of two kinds: first, those in relation to the soil; and, second, those affecting the product of the soil (the farm crop). Orchard troubles are divisible into the same two categories, troubles which are connected with the character or management of the ground, and difficulties of plant growth caused by the presence of injurious enemies. Of course, the soil, and the difficulties connected therewith, embrace the larger number of inquiries. It is reasonable, too, inasmuch as it is nature's labora-



PLAN OF BARN FLOOR. Fig. 15.

tory; and this laboratory, like many of men's laboratories, occasionally gets out of order.

A farmer writes: "My land does not now yield good crops, though I manure it every year with commercial fertilizers. What can I do?" Another man says: "My *new* land does not yield half the crop of wheat that I get from my old. Why?" Then another says: "I have a field with clayey hollows and sandy knolls. Will it pay to make an exchange of soil, carrying the sand to the hollows and bringing the clay to the knolls?" Again another says: "I have a sod orchard of Greenings. The trees were planted 30 years ago. They have not been pruned or cared for and they bear small crops of poor fruit. Can this orchard be renovated?" These are samples of the problems presented and questions asked. They are live problems, too, with a large per cent of the farmers of the State. Those who attend farmers' institutes, read agricultural papers and obtain experiment-station literature, know the importance of the gospel of humus for worn-out lands. Yet, it is a regrettable fact that this gospel while old to the few, is yet new to a large number. How unfortunate this is! The man who says that his farm no longer yields profitable crops, is evidently one of those to whom this gospel should be preached. He should know the value of clover and cover crops as specific soil regenerators. The Farmers' Reading Course Bureau is attempting to coöperate with the farmers' institutes and other agricultural intelligence agencies in disseminating this knowledge. Why new lands are unproductive is quite another question. Specific and definite directions cannot be offered in these cases. Suggestions only can be made. One immediately queries as to the physical condition of the soil—whether in the process of clearing it has been burned over, and in this way the surface humus destroyed; whether it has been plowed in the Fall and the furrows thrown up so that the fullest benefit of frost action might be secured; finally, whether it is not in necd of underdraining.

In the case of the man who wants to swap clay for sandy soil, we have still another question. Here it is largely one of expense. There is no doubt that such an exchange would be mutually beneficial, but the practicability of it would hinge upon the expense. Probably the physical character of these soils might be improved cheaper, by working in coarse yard manures in the case of the clay and green manures in the case of the sandy loam. The question relative to the renovation of the old orchard is a very common one. Here, again, we have another factor entering into the success of the undertaking and affecting the results very materially. The question here is one of quality of labor. Some of the operations connected with the renovation of that orchard require judgment and skill. The ground will need to be plowed and cultivated. This can be done with the ordinary farm labor. The trees will need pruning and spraying. Here judgment, personal interest and some practical skill are required. If the owner is in such a position as will enable him to oversee the work, if he knows how it should be done, or can do it himself, then a large share of the difficultics are removed. If, on the other hand, he is a city man, and resides some distance from his orchard, and must depend upon such labor as is easily obtainable, then the undertaking assumes a much more doubtful complexion. The issue is quite uncertain. There is no doubt, however, that the renovation of such an orchard is entirely feasible and a safe business proposition if knowledge and intelligent labor are available. In considering the character of letters one receives in connection with this farmers' reading-course movement, one cannot help being more and more impressed with the favorable attitude of the New York farmer toward the effort being made for the improvement of his position. This is exceedingly encouraging, and augurs well for the ultimate good of the movement. JOHN CRAIG.

Ithaca, N. Y.

FARMERS' INSTITUTES.

The Earliest Meetings.

We have had annual meetings of boards of agriculture, agricultural societies, farmers' conventions, lectures on agriculture and science, farmers' clubs, etc., but the term "institute" conveys a meaning a little different from any of these. One or more addresses or lectures on some topic pertaining to rural life, to be followed by discussion and questions by the audience, are the leading features. Local history, music, show of fruits or other products may come in to add interest and instruction. About 50 years ago the Farmers' Club of the American Institute in New York held weekly meetings of this pattern for many years. Greeley and other New Yorkers could tell what they knew about farming, while farmers from all parts of the country were invited to present their special topics, the dairy, cattle breeding, horticulture, sheep, ornamental tree planting, etc. These addresses were followed by questions and discussion, distribution of fruits or scions, etc. These meetings were regularly reported in the New York dailies until it became natural to use the term "institute," as applied to a similar class of meetings. A greater range of topics was allowed than would now appear in a well-managed institute, and some men were always ready to ventilate their theories upon an unsuspecting audience.

I used often to attend these meetings whenever in the city and on one occasion heard Mr. Pell, of Pelham, the man whose skill in raising Newtown Pippins and success in shipping to England gave rise to the apple-shipping business of the present day. Mr. Pell gave an illustrated lecture on the effects of galvanism on the growth of plants. He exhibited specimens, in pots, of tomatoes and other plants treated with galvanism, compared with others under the same conditions, the galvanic action being left out. The results were so wonderful and convincing that I immediately arranged for testing the question myself, as the world was crazed by the reports of similar

experiments in pots and field in Britain. I obtained my apparatus, but in the meantime so much doubt was thrown on the accuracy of these experiments, that I have left this question to be tested and settled by the experiment stations, if any have faith enough to make the trial. Squibs like this appeared in the papers: "It is said that with proper care by the use of galvanism we can so hurry up growth that we may plant the seeds of cress in the morning and raise a salad for a late dinner." While we have not yet got the hasty-grown salad has not galvanism done more wonderful things for us in modern civilization?

Connecticut. T. S. GOLD.

Why They Are Called Institutes.

Teachers' institute (U. S.), a gathering of school teachers for instruction and mental assistance. Institute, v. t., to educate; instruct. We speak of the Cooper Institute: the institute of technology. The lectures of Dr. George Birkbeck to workingmen in Glasgow, about the year 1800, were the beginning of the first mechanics' institute. The above definitions are mostly taken from the Standard Dictionary of the English language. The use of a word with a certain meaning, by educated persons, after a time makes it correct. The Institute of Technology in Boston, Mass., might be called a college as we now use the term. The Pratt Institute in Brooklyn is a technical school. A farmers' institute is now spoken of as college-extension work. On August 30, 1871, the trustees of the Illinois Industrial University, now known as the University of Illinois, passed a resolution that the regent and corresponding secretary be authorized to make such arrangements for holding during the coming Winter farmers' institutes at the University and in other parts of the State, as they might find advisable. "We want to bring the live, practical men and the live scientific men together that all may be benefited." The regent of the University, Dr. John M. Gregory, was the leading spirit in starting institutes in Illlnois. Formerly he had been State superintendent of public instruction in Michigan, where he planned teachers' institutes to be held in different portions of the State. Within 10 or 15 years we have heard much of extension work by universities, which some have said originated in England, but the Illinois University began university extension two years before Cambridge, England. W. J. BEAL.

Michigan.

A LANTERN MOTH TRAP.

I send circulars of a new moth trap. What do you think of it? I am a firm believer in spraying, but if this trap will eateh the Codling moth will use it, too.

Bradrick, O. E. G. C.

Most of the claims made for this new moth catcher or trap in the advertising circulars sent out are preposterous; and the use of such terms as "stinging fly," "borer fly" and others, shows that the inventor is not familiar with the insects which infest orchards and other crops. While it is true that an ordinary lamp or other sources of light will attract many different kinds of insects, it is also equally true that many other insects rarely fly to lights. Again, while lights or "trap lanterns" or "moth traps" will attract some of the adult forms of injurious insects, like certain moths and beetles, there are many injurious insects of which a few of the adults are only accidentally caught in such a trap, and, furthermore, many beneficial insects are also caught, sometimes enough to offset all of the injurious kinds. I make these generalizations regarding insects attracted to lights, and thus liable to be caught in a "trap-lantern," from a season's experience in experimenting with a series of such lanterns in various locations on a large farm. My "trap-lanterns" were set near or in orchards, near gardens, in cornfields, in grain fields, and in meadows. Thousands of insects were captured in these lanterns, and their dead bodies carefully preserved an dstudied. Large numbers of cutworm moths and of tent caterpillar moths flew into our lanterns, but a large proportion of these were males, so that we doubtless reduced the numbers of the progeny of these insects, but very little. With most of the insects we caught it was also true that a large majority were males. Most of the beetles we trapped were May beetles or "June bugs," but few of them were females. We caught no Plum curculios, no Potato beetles, no beetles of either of the Apple-tree borers, none of the moths of the Peach-tree borer, no Codling moths, and in fact, but comparatively few specimens of any serious farm or orchard insect pest, except the cutworm moths, tent-caterpillar moths and "June bugs" mentioned above. I do not believe the "new moth catcher" will entrap enough Codling moths, Plum curculios, Potato beetles or any orchard pest to pay for one of the lanterns.

The fact that many different kinds of moths are thus often attracted to lights or to alluring bait in large numbers has led many to believe that the Codling moth could also be lured in sufficient numbers to make it pay to build fires or to place trap-lanterns in an orchard, or to hang sweetened or other baits of various kinds in the trees. Many experiments have been tried along this line by such reliable observers as Riley, Cook and Atkins, and so few Codling moths were captured as conclusively to show the entire futility of attempting to check the pest in this way. Many collectors of insects also report very few captures of the moth at their lures or at lights. Most of the reported captures of the insect in large numbers at baits or traps are the results of mistaken identity. In short, practically all of the definite evidence we have regarding "trap-lanterns" or "moth traps" shows that they are of no use in reducing the numbers of orchard insect pests. One thorough spraying with Paris-green and Bordeaux Mixture at the right time (just after the blossoms have fallen in an apple orchard) will be more effectual against insect enemies than a half-dozen "new moth catchers" in each tree. This notion that insects can be caught at wholesale with a light and trap has been an alluring one to many inventive or restless minds, and hundreds of such devices have been exploited, many of them patented. But none of them has fulfilled the hopes and claims of the inventor when they are put into the hands of experimenters or hard-headed practical agriculturists. M. V. SLINGERLAND.

BUILDING A STONE ROAD.

Ordinarily we find that stone broken uniformly will compact together upon a dry hard earth foundation so that eight inches in depth is sufficient for all practical purposes. It is put down in courses as follows: After the earth foundation has been thoroughly compacted by rolling, and made as uniformly as possible with the proper slope from center to side ditches, a

A HAND-RAISED PIG. Fig. 16. See Page 46.

shoulder is placed at the outer edges of the stone construction. The first course is four inches in depth. This is put on uniformly, and the roller passed over it a few times to bring the pieces of stone together as nearly as possible; thus lessening the voids. The voids are then filled with ground stone from the crusher, by placing it on top of this broken stone and rolling it. A light sprinkling to work the particles down into the foundation is serviceable, but water ought not to be put on in quantities so great that it will run through the stone and soften the foundation. The rolling should be repeated until the mass becomes consolidated together, and if it is left for a while for the action of the air and sunshine it will take a set and become hard. This course we call the "stone foundation." This may consist of large stones from two to 2½ inches in diameter on the average. The larger stone is used so that the whole product of the crusher can be utilized.

The second course is of stone not greater than 1½ inch in diameter on the average placed on the road in the same manner as the foundation stone. More water can be used on this course, as it will not be likely to pass through, and on the surface we put the ground stone about an inch thick, and as it disappears down in the stone to fill the voids we place more on when necessary, and wet and roll until the whole surface becomes smooth and hard. In this way we get the voids filled in the bottom of the course first. It may be necessary to put on the ground stone several times before we get all the voids filled. Too much shade is damaging to a road, while a little shade is no injury. Trees ought to be at least 50 or 60 feet apart to allow the air and sunshine to dry the roads after rains. When the leaves fall they should be removed by sweeping or raking them up when they are dry and burning them. This is very important, and should not in any case be neglected, as the leaves retain moisture which in time will soften the surface of the road bed, and cause it to become rutty, work up into dirt and cause a certain amount of mud as a result.

The road should, at all times, be kept clean and free from mud and dirt, and any vegetable matter that would tend to cause it to be soft and muddy should be removed. As to the cost of the road, that depends upon so many conditions that it would be impossible for me to tell. It depends largely upon the cost of the stone, which embraces the quarrying and hauling. The cost of hauling depends upon the distance, the quarrying upon the condition of the stone in the quarry. The crushing, however, with a portable crusher will cost about 20 or 25 cents per cubic yard. Bowlders found in glacial districts make excellent material for roads, as they are generally found to consist of igneous rock. Flinty rock is not suitable for surfacing a road, as they crush too easily under heavy travel, but flinty rocks and fine dust, sand or shale can be used in the foundation course. I may say in regard to cost of roads where the stone is furnished free of charge and the haul is not over a mile or two, and not include the cost of grading, or preparing the roadbed, the stone construction can be made from $1,200 to $2,500 per mile. E. G. HARRISON,

United States Special Agent and Road Expert.

COVER CROPS IN APPLE ORCHARD.

The articles that have recently appeared in The R. N.-Y. by Prof. Craig and others lead me to say that about the best cover crop I find for my orchards is chickweed. If the land is as rich as it ought to be this weed will take care of itself; with the first Fall rains it will come up quickly, a perfect mat, grows rapidly. Often with us it gets "knee high"; grows all Winter whenever there is an open time. It catches most of the leaves and holds them firmly until time to be plowed in Spring. When the proper time comes chickweed is quickly worked into the soil, furnishes with the retained leaves much humus, and never grows during the dry weather of Summer. But why plow the apple orchard at all? Another year's experience has more fully grounded me in the faith, that constant cultivation is *not* the best way to treat an apple orchard. Keep it constantly in pasture, and treat it properly, and it will be more healthy, grow more fruit of a higher color, better texture and flavor, and that will keep longer and shrink less than it can be made by any system that involves constant cultivation; treated properly, remember that.

J. S. WOODWARD.

A HEMLOCK HEDGE.

If Reader, page 864 (December 29) wishes to set a native hemlock hedge and not have to fill in or leave spaces where little trees die, he will take Mr. Van Deman's advice, and select grass-grown bushy little trees. He will do well to get all as nearly two feet high as possible, and cut back to about 15 inches, taking off no branches. He will wait till past the time for setting trees that shed their leaves, and until he can see the little pale-green new growth starting out. Then, if he is careful in taking up, puts in plenty of water while the earth is being filled in, and packs the ground firmly, he will probably lose few, if any, plants. If he wished to be quite sure in setting his hedge he could take up his wild trees and set them in an easy place to dig, leaving them for two years. They will then, the living ones, have a mass of fibrous roots that will insure them being safely transplanted if reasonable care is used. He will get a hedge that way about as quickly as by setting wild trees in the hedge row, and if he cuts it properly a little every year he will have as beautiful a hedge as grows, taken the year round. R. S. HINMAN.

Connecticut.

FISH FOR CORN FERTILIZER.

I notice in your issue of December 1 this question: "Will whitefish at $1 per 1,000 do for manure alone for corn?" In the Spring of 1899 I put on to one acre of land 20,000 whitefish, for which I paid $25. The fish were spread and plowed in, and when well harrowed the lot was planted to Sciota corn. It was planted in hills three feet 10 inches each way, cultivated and hoed twice. No other fertilizer of any kind used. Result, over 110 bushels of ears of corn, good and sound. The corn a little more than paid for the fish. The stover nearly paid for the labor, so that I called it an even thing. In the Spring of 1900 the same ground was plowed and planted just the same without any fertilizer whatever. Result, 125 bushels good, sound, nice Sciota corn, stover nearly paying for the labor. The corn cost me the Fall of 1899, 50 cents per bushel, shelled. In 1900 it cost me only five cents per bushel, shelled. The land is in better condition for any crop now than in the Spring of 1899. This plot had been planted two previous years to corn and potatoes; with a little phosphate in the hill and a promise of fish (which it did not get). I have seen fish used for manure for corn more or less for 60 years, and cannot call to mind a single failure to bring a fair crop if put on before June 15. I do not know how it may be elsewhere, but I do not think any one who had to buy fertilizer for corn should be afraid to buy fish at $1 per 1,000. On my land I can get better results (in corn and rye) with $1 worth of fish than $2 worth of any other fertilizer.

Self-Fertile Apples.

W. H. S., Rocky Hill, N. J.—Is the Rome Beauty apple self-fertile? If not, what variety is best to plant with it? Will Stayman and Rome Beauty fertilize each other?

ANS.—Yes, I believe the Rome Beauty to be self-fertile, the Stayman is so new that there is very little experience upon which to base an opinion as to its merits as a pollenizer. If it is like its parent, the Winesap, it is valuable in this regard. I would have no hesitancy in planting these two varieties either singly or together. H. E. VAN DEMAN.

Hales Hickorynut; Gilbert Black Walnut.

B. C., East Freedom, Pa.—Can any reader of THE R. N.-Y. tell who grows trees of Hales shellbark hickorynut and the Gilbert Black walnut?

ANS.—There is no one now propagating either of the nuts mentioned, so far as I know. They are very difficult either to bud or graft, and those who have tried to propagate these and other varieties of the hickorynut and walnut have met with very little success. The whole matter is in the experimental stage as yet. H. E VAN DEMAN.

Germinating Mahaleb Cherry and Apple.

J. D. G., Wichita, Kan.—1. Will Mahaleb cherry seed sprout well with same treatment as peach pits? 2. Will it do to plant apple seeds now, or is it better later on, say about February 1?

ANS.—1. Yes, Mahaleb cherry seeds ought to sprout about the same as those of the peach, if they are treated properly. This requires that they be kept moist all Winter in moist earth in a cellar, or in the open ground, planted or stratified. 2. Apple seeds could be planted any time during the Winter when the ground is in workable condition. However, if they are now in good, moist condition they may be expected to do as well if planted in the early Spring. H. E. VAN DEMAN.

Fruit Questions from Colorado.

C. H. C., Paonia, Col.—1. When and how shall I spray apples to protect from Codling moth? I have not been successful so far. 2. Is the Bartlett the best market pear? How does the Anjou compare with it? How would the Anjou (being a much stronger grower than the Bartlett) do to top-graft to that variety? 3. Do you know anything about those new varieties of apples that a western nursery is praising so highly, the Black Ben Davis, Senator, Apple of Commerce and Stayman? 4. Is the White Winter Pearmain a good-selling apple? 5. Is the Carman peach better than the Elberta? 6. Is the Bean spray pump one of the best?

ANS.—1. The proper time to do the first spraying of apples for destroying the Codling moth is just after the bloom falls. Careful experiments have thoroughly proved this to be true. The cause of failure to protect the fruit from this pest, as mentioned, was probably due to the inefficiency of the poison or lack of thoroughness in its application. It is not very difficult to save at least 75 per cent of the fruit by using the spray-pump in a right manner. Prof. Kedzie's preparation of white arsenic and lime is one of the most effectual and cheapest poisons known, and better as well as cheaper than Paris-green. 2. Pear growing is a profitable business if wisely followed. The Bartlett is the leading variety for market, except it be the Kieffer. Anjou is a very good pear, but it is so large that it falls rather badly. The trees would make a very good stock for grafting other kinds upon. 3. The apples mentioned are all so new that it is impossible to give an intelligent opinion of them as to their behavior over the country, except in case of the Stayman, which is quite well tested and known to be valuable. 4. White Winter Pearmain sells quite well where it is known, as it is of good quality, but it is of the wrong color to be very attractive in the general market. 5. Carman is a very good peach. It is better in quality than Elberta, but not more popular in market. 6. The Bean spray pump is a very good one.

H. E. VAN DEMAN.

Newtown Spitzenburgh.

Z. W., Cicero, N. Y.—I would like your opinion of the New York Vandevere (Newtown Spitzenburgh of the West) apple which I find mentioned in a recent catalogue. About 30 years ago I bought an apple or two of this variety at a stand in Syracuse. I never before and never since have found its equal for superiority of color and flavor till last Summer at a neighbor's, but under a different name—Winter Strawberry. I have never seen the same apple mentioned in any nursery catalogue before or since till recently. I am setting out a young orchard, now in my ninetieth year of age, and though I may not live to see any fruit from it, I do not wish to entail upon others apples or orchards which are not satisfactory to myself.

ANS.—Newtown Spitzenburgh is the approved name of one of the choicest apples in existence, so far as quality is concerned, and it is also quite handsome. It is often called New York Vandevere, especially in the Eastern States. I have never heard it called Winter Strawberry, although some may do so. I have seen it in many sections of the country and have long prized it so much that when I planted a family orchard on my farm in Kansas this was one of the varieties selected. It is not a very late keeper, and the tree is not satisfactory under some conditions, but it is well worthy of a place in almost any select list of choice Winter apples.

H. E. VAN DEMAN.

Planting an Orchard.

B. C. B., Moscow Mills, Mo.—1. I have recently come in possession of a piece of thin clayey land, and I wish to plant nursery stock on it this coming Spring. Would you advise the use of commercial fertilizers? If so, what is the best, in what form would you buy it, how would you apply it, and how much in quantity? 2. I have a lot of Summer, Autumn and the least desirable Winter varieties of apple trees, two and three years old. Would you advise planting them and afterwards top-graft to desirable commercial varieties, or would it be better to plant the commercial varieties? I have no sale for the first, while the leading commercial varieties are sold easily at $65 per 1,000.

ANS.—1. An abundant application of well-rotted stable manure would be better than any kind of commercial fertilizer, because the land is doubtless deficient in humus. In addition to the stable manure it would be beneficial to use the commercial fertilizers also. A mixture of 300 pounds muriate of potash, 500 pounds acid phosphate rock and 200 pounds nitrate of soda would be about right for one acre. 2. I presume it is intended that the trees mentioned are to be planted in orchard form and not in a nursery. It would seem, under the circumstances, that it would be wiser to plant them out and top-graft them the second year after setting than to destroy them. H. E. VAN DEMAN.

Castor Pomace and Insects.

J. R. B., Starke, Fla.—I wish to know whether castor-bean pomace used as a fertilizer will destroy insects in the soil. Will they eat it used in that way? We have an insect in this State called the Cricket-mole, which is very destructive to newly-set strawberry plants and other crops.

ANS.—I believe that castor-bean pomace will not have the desired effect in destroying insects. It is, in my opinion, nothing but a superstition, and I have heard the same thing advanced as a reason why the castor bean should be planted about the houses, but have never yet seen an instance where it produced any effect. H. HAROLD HUME.

BURPEE'S FARM ANNUAL FOR 1901
"QUARTER-CENTURY EDITION"
A Grand New Book of two hundred and twenty pages. Entirely rewritten at our famous FORDHOOK FARMS—the largest Trial Grounds in America. New Directions for culture, New Leaflets, New Novelties of unusual merit in both Vegetables and Flowers, Elegant New Colored Plates. The Quarter-Century's Record of Progress, New Cash Prizes, and other New Features. The largest, most complete, and BEST SEED CATALOGUE ever published. Mailed for ten cents, which is less than cost per copy. Name this paper, send ten cents (silver or stamps) and with this great catalogue we shall send a 15-cent packet of either Burbank's *Unique Floral Novelty* or Burpee's wonderful, new, dwarf, meaty, bright-red, earliest Tomato,—"*Quarter-Century*."
☞ Should you object to paying ten cents for a seed catalogue (even though it is worth a dollar), then write a postal card for Burpee's "SEED-SENSE" for 1901,—a "strictly business" catalogue of ninety pages. W. ATLEE BURPEE & CO., PHILADELPHIA, PA.

Peck Pleasant Apple.

Reader, Bergen Co., N. J.—Is Peck Pleasant an apple of value for Saddle River Valley, or is it superseded by others?

ANS.—Yes, Peck Pleasant is one of the very best of our Winter apples in regard to quality. It is of rather dull color, being greenish yellow, but it is good enough for anyone on close acquaintance. It is suited to almost any section where apples succeed, and, no doubt, would do well in Bergen Co., N. J., although I have never seen any specimens from there, so far as I remember.

H. E. VAN DEMAN.

Apple Seedlings.

N. B., New Cumberland, Pa.—Do the nurserymen buy apple seedlings and graft them now as they did 20 years ago? I would like to grow about 200,000 to sell. Twenty years ago I could have sold 500,000 as easily as 5,000. I received $4.50 per 1,000. They averaged about three lengths to each root. Is there a demand for them now, and where can I buy apple seeds by the bushel?

ANS.—Yes, the nurserymen follow the same methods, practically, in propagating apple trees that they did 20 years ago. The most common method is by root-grafting on pieces of one-year-old seedlings in the house during the Winter months. Budding in the nursery row is also followed to some extent. This is claimed by some to produce a better tree than by root-grafting, but in practical orcharding I have not been able to see any material difference. Apple seeds are usually bought of a few of the wholesale seedsmen, and sometimes of the wholesale apple-seedling nurserymen. H. E. VAN DEMAN.

Stable Manure for Potatoes.

J. G. K., Karns City, Pa.—I have a five-acre lot that was in oats last year; former crop unknown. I expect to put on it about 125 two-horse loads of manure, plow it under, and plant to potatoes. The ground is mellow creek bottom, naturally good. Would you consider this plan all right, or what more can be done to get a good crop?

ANS.—We do not like to use stable manure heavily for potatoes except on low or sour soils. On lighter soils our experience is that fertilizers give better results. We would prefer to use half the manure you mention and 600 pounds per acre of a high-grade fertilizer. The objection to stable manure is that it neutralizes or sweetens the soil, and thus encourages the growth of the scab germ if it be present.

A Liquid Grafting Wax.

J. J. S., Fowblesburg, Md.—Give recipe for making grafting wax in a liquid state, and in wax state.

ANS.—The following recipes have been extensively used and are reliable: Hard wax: resin, four pounds; beeswax, one pound; half a pint or more of raw linseed oil, free from all cotton-seed oils or other adulterants. Melt all gradually together, turn into cool water, and pull until smooth. More oil can be used if too hard. Liquid wax: good white resin, one pound; beef tallow, one ounce. Melt and remove from the fire. Add gradually eight ounces of alcohol, stirring until mixture is smooth. Keep in closed bottles and apply with a brush when used.

Tobacco Stems for Green Lice.

F. H., Sarnia, Canada.—Could you tell the best way to get rid of green fly on lettuce in the hothouse?

ANS.—Tobacco stems at the rate of 100 pounds to each 20 feet of bench or bed, placed in the walks or hung in nets under the benches, should rid your lettuce of green flies or aphides. Keep them damp by frequent sprinkling. The stalks may also be strewn among the plants. If the insects have gained a strong foothold it may be necessary to fumigate with damp tobacco. Use about one pound of stems to each 100 feet of glass, and repeat the fumigation three or four times a week until the aphides are destroyed. Do not let the tobacco blaze, but keep it smouldering. It is best to avoid the use of smoke when possible, as it affects the quality of the lettuce unfavorably.

BITS OF TALK.

When is the best time to sow Red-clover seed?

In the Spring, at the last heavy frost. We would sow early in the morning on the frozen crust. The later thaw will work the seed in.

* * *

Why do you consider it so necessary to save the liquids of the manure?

It has just been shown by the Pennsylvania Experiment Station that the urine of cattle contains half the nitrogen and three-quarters of the potash in the food. These liquids have "legs"; that is, they run away if permitted to do so, aud thus squandor over half the manurial value in the food. Plaster or absorbents are stable policemen to arrest this fertility.

* * *

What is the simplest fertilizer mixture for fruit?

Three parts of fine ground bone and one part muriate of potash. This is not always the best or the cheapest.

* * *

Is hard-wood sawdust injurious to the soil when it is used as an absorbent for liquid cow manure?

No. Sawdust, when fresh, contains an acid which might injure soils inclined to be sour. The urine of manure neutralizes this acid. It is then safe to use.

THE "WONDERFUL INSECT" described by Prof. Slingerland (December 22, 1900), in addition to the way in which it lays its eggs on stones or brush overhanging or projecting above the surface of the water, also drops the eggs in the water, as I have seen them doing in my ponds in North Carolina. They fly over the water, darting down to the surface, and dropping an egg several times a minute. That the larva is eaten by fish is very certain, as it is one of the most attractive baits for bass and trout, and as I always examine the stomach of every fish I take, I have abundant proof that trout prey on these larvæ. Here at least these flies do not remain hidden during the day, but on the contrary are very active, poising themselves in the air over or about a boat, as if curious to learn what it is, as well as flying down to the water, evidently examining the flies with which one is fishing. I have no bass in my waters, but plenty of trout, both the common variety and the Rainbow trout, and both these will take the hellgrammites as also rise to the fly itself, although I have never seen a fish take one; possibly not being captivated by its appearance. H. STEWART.

Maule's (*35 new things for 1901*)
Seed Catalogue

You should, by all means, have this **most modern catalogue of modern times.** It is brimful and overflowing with good things in vegetable, farm and flower seeds, flowering plants, fruits, bulbs, etc. **It contains 35 novelties in vegetables and flowers never offered before,** has 136 large pages, seven handsome colored plates and hundreds of illustrations. It gives practical, up-to-date cultural directions and offers many cash prizes. The first edition alone costs over $30,000, so while we send it free to all customers, we must ask others to send 10 cents for it, which amount they may deduct from their first order. You will make a mistake if you do not write to-day for this the Novelty Seed Book of the year. Address,

WM. HENRY MAULE, Philadelphia.

GOOD SEEDS CHEAP
BEST on Earth.
Only 1c to 3c per pkg.
Postpaid & all TESTED.
GRAND lot of extra packets in all orders.
I control large Plantations in many States, and Europe.
Rare & New sorts cheap.
Seed in bulk by lb. & bu. cheaper than any grown.
Fruit Trees & Field Seed low.
FREE Great! Grand! Illustrated Big Catalogue. Send address.
Also those who want SEEDS.
R. H. SHUMWAY,
ROCKFORD, ILLINOIS.

Seeds! Seeds!
77th Annual Priced Catalogue of
Vegetable, Farm and Flower Seeds
is now ready and mailed free to all applicants.
BRIDGEMAN'S SEED WAREHOUSE,
37 East 19th Street, New York City.

If You're a Seed Buyer
you should consult the best **Seed Catalogue Published.**
Honest photographic illustrations.
Mailed free to garden owners.
JOHNSON & STOKES, 217-219 Market St. Philadelphia, Pa.

Rich or Poor
you cannot afford to buy poor Seed. Our guaranteed seeds give best results everywhere. Originators of the New Queen, Early Norther, Early Harvest, Minister, Gem of Aroostook and Northern Beauty Potatoes. Illustrated Catalogue free.
THE GEO. W. P. JERRARD CO., Caribou, Me.

Try the New Auto Strawberry. Largest and Best. 8,000 qts. to the acre. 1 doz. plants for $2. Other good kinds as low as $1.50 ℔ 1,000. Cat. free. Slaymaker & Son, Dover, Del

Speltz GREATEST OF ALL CEREALS
Speltz Startled the Farming World in 1900;
it will capture every heart in 1901, with its 80 bu. of grain and 4 tons of hay, equal to Timothy, per acre. Get the genuine, buy of Salzer, the introducer.
Combination Corn
is one of the greatest things of the century. It is early and an enormously, fabulously big yielder, a sort bound to revolutionize corn growing.
215
Salzer's Vegetable Seeds.
The beauty about Salzer's vegetable seed is, that they never fail. They sprout, grow and produce. They are of such high vitality they laugh at droughts, rains and the elements, taking 1st prizes everywhere. We warrant this.
For 14 Cents and This Notice
we send 7 packages of rare, choice, fine, splendid vegetable novelties and 3 packages of brilliantly beautiful flower seeds, all worth $1, and our big catalog for only 14c and this Notice, in order to gain 250,000 new customers in 1901, or for 10c, 10 rare farm seed samples, fully worth $10.00 to get a start and our great catalogue.

Ruralisms

NOTES FROM THE RURAL GROUNDS.

THE GREENHOUSE CHICKENS AHEAD.—The small broods of early chickens protected in the greenhouse, as noted in THE R. N.-Y. on page 208 and 338, 1900, are proving winners in the laying record. The Summer-like warmth and security from drafts gave them such a start in development that egg-production commenced remarkably early in the Fall, and is kept up at a most satisfactory rate. They get about as good care as chickens can reasonably expect, their individual wants and peculiarities being catered to by their attendant, but the advantage of a good start is plainly evident. A good variety of grains, consisting of corn, wheat and oats, a hot mess of cooked bran and table-scraps every morning, and a light, dry, scratching shed, furnish them with the needed facilities for the manufacture of the desired eggs. A particular feature is made of supplying them with clean, fresh water at all times, and care is taken to see that the supply of gravel, crushed oyster and clam shells never runs out. Cut fresh bones do not appeal to the mistress of our little poultry yard, as it often appears to be a nasty mess, in comparison with table scraps and kitchen trimmings prepared in a cleanly manner. If a greater number of fowls were kept than the 25 to 30 we have accommodations for, it would probably be necessary to resort to green bones or meat scraps for the required protein. After many trials of fancy-bred fowls of several of the breeds now popular, we have settled on grade Plymouth Rocks and Brown Leghorns as best for our purpose of fairly constant egg-production and table use. None of the purebred fowls ever seemed profitable from our point of view. They were pretty to look at, but they always failed to produce the eggs with sufficient regularity, and were plainly less hardy than grades and cross-breeds. An occasional exchange with neighbors brings in the needed fresh blood, and while the flock is degenerating, according to the fancier's opinion, to the grade of barnyard fowls, it remains in a state of satisfactory efficiency. We do not wish to decry the work of breeders in keeping strains pure and distinct. These high-bred fowls afford a powerful means of grading up ordinary stock, but the fact remains that they are seldom satisfactory for the direct manufacture of poultry products.

JADOO IN THE GARDEN.—A number of tests of Jadoo fiber were made in the field last Summer. Sweet corn, tomatoes, cucumbers, sweet peas, pansies nd a few young rose bushes were planted. each with a goodly quantity of Jadoo for the roots to run in, and near by similar plants with an equal bulk of garden compost as a fertilizer. In every case the plants in Jadoo showed a stronger growth, the foliage was noticeably greener, and the plants held up better during hot dry weather, but the yield in fruit and flowers was not perceptibly increased except in the case of sweet peas and pansies, both distinctively moisture-loving plants. Jadoo is a material that does not easily decompose, but it is extremely retentive of moisture, and once saturated by rain or irrigation gives it up to the plant roots very gradually. The pansies and sweet peas, the latter of the bush and Cupid types, were greatly benefited by the Jadoo, and we are inclined to continue its use for similar plants, but we can see no great advantage for such strong growing crops as can usually take care of themselves with ordinary fertilizers containing a good percentage of humus. It is largely used abroad in old, long-cultivated garden soils for such plants as tomatoes, which do not adapt themselves well to the climate. Under glass we have found it very useful in starting seedlings and delicate plants which have to be grown in small pots. There is less danger of drying out, and of attacks of fungus troubles, but on the other hand plants in Jadoo are likely to be injured by excess of water unless kept separate from those in soil. The material is very lasting, and may be used repeatedly until consumed. We find that a mixture of one-third Jadoo and two-thirds garden loam, without additional fertilizer, suits our plants very well, and is less likely to become sodden than the pure article. Jadoo and its mixtures with soil can be sterilized by exposing to dry heat in an oven sufficient to roast a potato, without losing much of its fertilizing properties. This is of advantage where scarce and valuable seeds are sown, or difficult plants propagated.

BROWN ROT OF STONE FRUITS.—Bulletin No. 50, Georgia Experiment Station (Experiment), treats of this most destructive pest, which annually sweeps away a great proportion of our peaches, plums and cherries just as they are about to ripen. Nothing can well be more aggravating than to witness the rapid transition of our fair fruits, which have escaped the dangers of frost, heat, storm and insects, into those repulsive masses of soft rot. As we have all observed, the brown rot spreads with greatest rapidity during hot, moist weather. When it is discovered it is too late to check its ravages by any known means except the immediate removal and destruction by burning, or deep burying, of the affected fruits as fast as they show the first spot of decay. This is poor satisfaction, but tends to prevent the complete loss of a crop. Spraying the trees and fruits after infection takes place is useless, but repeated experiments show that this most destructive disease may be reduced to tolerable proportions by three or four applications of Bordeaux Mixture, the first to be applied just before blossoming, the second after bloom has entirely dropped, the next 10 days or two weeks before fruit is expected to color, and the last, preferably of copper acetate solution to avoid staining, when fruit is coloring This is all very comforting, but we are quite certain that the scientists have not yet convinced the small fruit-grower or amateur that it pays to do all this. We were caught with a serious loss from rot among our experimental trees last Summer, but if there is virtue in repeated sprayings under our New Jersey conditions we will try to get it. The claim is also made that the keeping qualities of peaches are very much enhanced by spraying. The theory is that the spores on the ripening fruits being destroyed decay is not likely to set in for three to five days longer than would occur with unsprayed fruit. Too much importance can scarcely be assigned to this feature if its utility is borne out by repeated trials. W. V. F.

THIN CHILD

If a child is thin, let him take a little of Scott's emulsion of cod-liver oil.

Some children like it too well; begin with a little. A half- or quarter-teaspoonful is enough at first, if the stomach is weak; but increase, as you find the stomach will bear.

The effect is: the little one takes on strength; gets hungry; eats and is happy; gets fat—he ought to be fat—and gets healthy.

We'll send you a little to try if you like.

LEAN'S ALL STEEL HARROWS AND LAND ROLLERS.
Spike Tooth Harrow.

Lean harrows make fat harvests. They do more work and do it more efficiently than any other harrow. They tear up the ground, smooth it for sowing, harrow in the seed, kill the weeds after the crop comes up. The teeth are adjusted to suit any condition of the soil. By a touch of a lever they are instantly cleared of trash without stopping the team. The most substantial and finest finished farm implements made to-day. Made entirely of steel, light and durable. Both the spiked tooth and spring tooth harrow will save enough in a year to pay for itself.
If you want a Land Roller that will save its price in a single season, get a Roderick Lean Steel Land Roller.
Send for illustrated catalogue to-day.

HOPE FARM NOTES.

I will continue to answer questions and comments this week, as there are many good ones on hand.

LIVE HOGS.—I announced not long ago that after some study of breeds I had invested in a Berkshire—a black lady of royal blood and breeding. This is a sample of what I get:

I see you are going to breed Berkshire swine. Why didn't you take Poland Chinas instead? The Polands are far ahead of the Berkshire for a farm like yours. I think you have made a mistake.

My Cheshire friends also think I am wrong, and the Chester White people seem to know it. I am ready to admit that all these breeds have merit and there may be places where anyone of them would beat the Berkshires. At Hope Farm, however, I think our conditions are such that the Berkshires are most desirable. Some day I hope to put Polands of good breeding beside my Berkshires, give them all a fair chance and let the better hog drive the other off the farm. My judgment is that a black hog suits us best. Another man wants to know what breed of pigs we keep that will eat cabbage. He says he can't make his pigs eat such food. We have been keeping grade Berkshires and Chester Whites. From the first these pigs have eaten cabbage readily. At times it has provided two-thirds of their total food.

FARM VALUES.—The following letter is of interest to me since I have been trying to bring our farm accounts down to a business-like basis:

It is with interest that I noticed your remarks in the Hope Farm Notes in regard to an inventory of stock and other equipment on a farm. Would not the purpose of the inventory help settle the value which should be put on the different items? It seems that the inventory should show not what one thinks he is worth, but the actual value of his property on the day the inventory is taken. Such being the case, would it not be correct to inventory all live stock at a price which could certainly be realized were they placed upon the market on the day the inventory is taken? This may be lower than one's own valuation of them for his own use, but it gets at the real cash value. The stock of corn or other feed on hand certainly ought to be worth what it would bring in the open market at the present market values. A field of Winter wheat ought to be, if well started, worth what it has actually cost to put it in. This should include, of course, barnyard manure or fertilizer used as well as all the time required either of men or teams. Barnyard manure ought to be estimated at a fair valuation, though this may be more difficult to estimate. One might, if he is a good judge, estimate the number of loads, and put it at say, 50 cents a load, if it is of the best quality. This is what, in most sections, it would cost if bought, and it is about what can usually be got for it. In a retail business with which the writer has been connected, it has been the custom to inventory all merchandise which is perfectly salable and fresh at the cost price unless the market has changed. If the market has advanced, it is still inventoried at cost price; but if the market has declined, it is inventoried at the lower price. Goods which may be slightly shelf-worn or which are somewhat out of date are inventoried at a price which will, without fail, sell the goods. For example, two years ago a book which has been supplanted by a later edition and which had cost $4 was inventoried at 50 cents, and there were about 20 of them on hand. The books were afterward actually sold at $1.50 and $2, but the estimate was one which could most certainly be realized. One does not always hit it as well as this, for there are times when it is impossible to avoid a loss even at such low valuations. Then, when the entire amount is figured up 10 per cent is deducted from the gross amount to make everything perfectly safe. This, of course, is rather severe, but at the same time it always keeps one on a safe basis. The same methods might largely be applied to farming. A farm implement ought to be paid for in four years; that is, at the end of the first year it might be inventoried at 25 per cent less than cost, at the end of the second at half the original cost, and so on until it does not appear in the inventory. Young stock would increase in value from year to year if everything goes well. Mature animals will often decrease in value, depending, of course, upon the age and upon other conditions. All these things must be carefully considered in taking the inventory, and they are largely a matter of judgment. I shall be glad to see more notes on the results of your inventory and upon how you get at these values. A. W. STEPHENS.

I would like to hear from others about this. I never took an inventory of farm tools and stock before. I now see that the business of farming must lap over from one year to another. I wanted to put a fair valuation on what we have, so that we can tell from year to year what part of our income goes into material and tools. Some farmers do not put enough into such things, while others put too much. I have never thought it fair to measure farm business by cash returns entirely. On the other hand, some farmers put such a high valuation on their stock that the result is equally unfair. As to valuing stock at what it would bring on the market—that may be fair or not. We gure on Nefiw Year's Day when cash sales would be almost impossible. The same things offered for sale in April would bring 40 per cent more!

HOPE FARM STOCK.—Here are some items of value from my New Year's statement:

One horse, Frank	$150
" " Dan	125
" " Major	15
" " Nellie Bly	125
One pony, Peter	40
" cow, Jersey	25
" heifer, Blossom	30
" calf, Daisy	15
Six pigs @ $7	42
8 tons of hay @ $15	120
15 tons of stalks @ $5	75
70 hens @ .40	28

This of course is only part of a long list including wagons, plows, incubators and tools of all sorts. I did not estimate the manure at all, but when we come to haul it out we will know how many loads there are, and put a value on it. We have no large scales, and do not know exactly how many tons of hay and stalks there are. How do we get these values? Frank would readily sell for $150 to-day. In the Spring he would bring $200. I would not sell him for $250. He cost only $80 four years ago! Dan cost $150, but is not worth so much, on account of his eyes. Old Major probably wouldn't sell for $5, but the Madame wouldn't have him abused for $500. He will surely earn the interest on $15 officiating as "woman's horse." Old Jersey cost $40 with a calf which I sold for $7. She gives nearly as much milk as she did when I bought her, but costs more for grain since her teeth are going. Good hay sells at $20 in our neighborhood, but some of ours was damaged. As a substitute for hay our stalks are worth $6 per ton, though I think our new shredder will raise this value to $8. When figuring up all our outfit on about this basis I am surprised to see how fast young and well-cared-for stock and stuff gain in value, and how rapidly age and poor care destroy values. The farm inventory will bring these facts home to the farmer, and is worth money to him for these things alone. I make no attempt to value the grass seeding or the growing rye, or to estimate what the cow-pea vines on the back field will save in next year's corn crop. I will wait until I see that value in crib and stack. Am I not right in waiting until our labor has given a tangible, salable shape to such things before valuing them?

FARM NOTES.—I don't quite like the looks of my grass seeding. This open Winter, without snow and with freeze and thaw is likely to pull many of the plants out by the roots. Still, I think this grass is safer for the extra pains we took. The soil was well prepared and the seed was put in early, so that it had a good chance. I make no brags about it, however. . . . . I have bought a Leslie or St. Albans shredder for the stalks. It is a powerful machine arranged so as to use a knife head or shredder as desired. We have not yet put the power on it, but Charlie ran a few stalks through. "It didn't do a thing to them!' was his report, as he held up a few ragged-looking fragments. Old Major saw them, too, and let out a loud horse laugh of joy, for a whole stalk is tantalizing to a large stomach when poor teeth stand between. We expect to put the power on this week. . . . We began the new year taking temperatures three times a day. I think such habits of making records are useful for all farmers. We care little which way the wind blows—the chief thing being that it blows hard enough to turn the windmill. Most of our prevailing winds blow down the valley from the northwest, and it is seldom that a day passes without power. . . . Speaking of stock and values makes me think that a good share of our profit, if there be any, must be looked for in the house. I suppose there must have been a time in the world's history when every wrinkle and gray hair which the Madame develops would reduce her value in an inventory! Happily she is not to be valued on the same scale as old Major! I suppose that about $1,000,000 for the Madame and half a million each for the children would be about right. Every good habit and noble thought fixed securely in the minds of these little folks is worth something to the country! In old times the value of the common people was estimated at the price they would bring in the market. I want my little folks to be valued at the price they will refuse to sell themselves for.

H. W. C.

WHEN you write advertisers mention THE R. N.-Y. and you will get a quick reply and "a square deal." See our guarantee 8th page.

McCormick

The McCormick Machines are the most **MODERN.** They are the Pride of the New Century. Highest in awards at the Paris Exposition. McCormick light draft machines dominate the fields of the world. Built best—work best—are best. With every test they prove the best.

McCormick

The McCormick Light Draft Binder is the most **MODERN** binder built today. It has concentrated upon it the vast resources of the McCormick Company, the largest builders of self-binders in the world. It is the binder by which the merits of all others are measured.

McCormick

The McCormick Twine was awarded the gold medal at the Paris Exposition. Its superiority is the result of its being spun by the latest, best and most **MODERN** machinery devised, and passing a most rigid inspection—McCormick inspection.

McCormick

The McCormick Light Draft Daisy Reaper is the most **MODERN** reaper. Used extensively on hilly land, and also for harvesting flax, clover, peas and similar crops.

McCormick

The McCormick Light Draft Mowers are the cleanest cutting, lightest working, farthest going, most **MODERN** mowers. They have recorded more sales than any other mowers.

McCormick

The McCormick Light Draft Hay Rake is everything that a farmer can ask for in a rake. It is the strongest, neatest, most **MODERN** rake.

McCormick

The McCormick Light Draft Corn Binder is the newest and most **MODERN** for cutting and binding corn. It is stiff, strong and successful. It binds the corn as it stands, which is the only successful way; this way is our patent.

McCormick

The McCormick Corn Husker and Fodder Shredder is a **MODERN** medium size machine with large capacity, fitted for one farm or several in the same neighborhood. It is a little giant—many buy it for job work. It is the surest money-making shredder on the market.

McCormick

The McCormick **MODERN** Light Draft Header is the best ever put into the field. Instead of six horses, only four are needed to draw the McCormick.

McCormick

The McCormick **MODERN** Knife and Tool Grinder is a boon to the farmer. "A sharp knife saves draft." It is quickly changed to a tool grinder.

Cooked Feed

It Saves Feed.

goes farther and gives quicker results than uncooked. The

GOSHEN Feed Cooker and Water Heater

has many advantages not found in others. Strongly **MADE OF STEEL** and galvanized to prevent rust or corrosion. Large fire box burns big chunks of wood or other fuel. Holds fire for hours. Double boiler gives clean hot water and cooks feed at same time. Cannot scorch feed. Has spark arrester. Fully guaranteed. Three sizes. Don't buy any cooker until you investigate the Goshen. We make Goshen Steel Tanks and Tank Heaters. Write.

AN ACRE OF CORN

and its possibilities under the Silage system—being the theme of

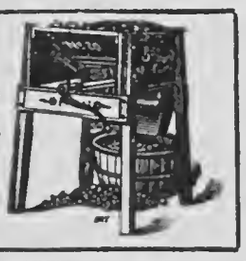
"A BOOK ON SILAGE"
By Prof. F. W. WOLL

of the University of Wisconsin. Revised and up-to-date, neatly bound into a volume of 234 pages. It embraces full information from planting to feeding the crop, and includes working plans and specifications for building all silos. Also embraces:

I—Silage Crops. II—Silos.
III—Silage. IV—Feeding of Silage.
V—Comparison of Silage and other Feeds.
VI—The Silo in Modern Agriculture.

And illustrations and complete plans for round and rectangular silos, dairy barns, tables of compounded rations, etc. Mailed for 10c. coin or stamps.
SILVER MFG. CO.
Salem, Ohio.

Banner Root Cutters.



Unequalled for cutting all kinds of roots and vegetables for feeding live stock. Take out all dirt. Cut fine. 5 sizes, hand and power. Catalog free.
O. E. THOMPSON & SONS,
Ypsilanti, Mich.
Largest Root Cutter Makers in the world.

THE LIGHTNING SEED SOWER

Guaranteed to sow 60 acres per day (either horseback or on foot) of Clover, Timothy, Millet, Flax, etc. Will be sent to any Post Office on receipt of..... $1.25
If not satisfactory, money refunded.
Circulars free. Agents wanted.
W. J. BUSS, 53 Day St., Golden, Ill.

WATCH CHARM FREE—All farmers interested in good **Fanning Mills** will receive a nice watch charm by sending 4c. stamps to JOHNSON & FIELD M'F'G. CO., Racine, Wis

Estab. '32 **SCALES** of every description. Satisfaction guaranteed. Write for prices. JESSE MARDEN, 109 S. Charles St., BALTIMORE, MD.

WELL DRILLING Machines

Over 70 sizes and styles, for drilling either deep or shallow wells in any kind of soil or rock. Mounted on wheels or on sills. With engines or horse powers. Strong, simple and durable. Any mechanic can operate them easily. Send for catalog.

SUBSCRIPTION: ONE DOLLAR A YEAR.

To foreign countries in the Universal Postal Union, $2.04, equal to 8s. 6d., or 8½ marks, or 10⅓ francs.

"A SQUARE DEAL."

We believe that every advertisement in this paper is backed by a responsible person. But to make doubly sure we will make good any loss to paid subscribers sustained by trusting any deliberate swindler advertising in our columns, and any such swindler will be publicly exposed. We protect subscribers against rogues, but we do not guarantee to adjust trifling differences between subscribers and honest, responsible advertisers. Neither will we be responsible for the debts of honest bankrupts sanctioned by the courts. Notice of the complaint must be sent us within one month of the time of the transaction, and you must have mentioned THE RURAL NEW-YORKER when writing the advertiser.

Name and address of sender, and what the remittance is for, should appear in every letter.

Remittances may be made in money order, express order, personal check or bank draft.

THE RURAL NEW-YORKER,
409 Pearl Street, New York.

SATURDAY, JANUARY 19, 1901.

HAVE a little patience with us at this time of year. If the date and label do not show credit promptly have no fear. Every remittance received is entered up carefully daily. We are yet a little behind with other work, but are catching up rapidly, and your credits will all appear shortly. Just so with orders for other papers. Other large publishers are behind at this season, like ourselves, but all orders are forwarded, and will be filled without unnecessary delay.

*

WHY not get up a little club for THE R. N.-Y. in your neighborhood? Send four names and $4 and your own paper will be credited for a year free; the five names for $4. If you are already credited for this year, keep $1, sending us $3 for the four names.

*

How many anti-oleo letters have you written to your Senator? None? You will feel like a hero, won't you, if he votes against the Grout bill and then says in excuse for such action that the people of his State didn't seem to care anything about it!

*

THERE are many good peach growers who class the Elberta peach with the Ben Davis apple. It is a showy, handsome fruit which sells for its face rather than for its flesh. One grower raised some fine-looking Elbertas, and was told, when he came the second time with them: "No, I do not want any more California peaches!"

*

WE have a letter from Senator Chauncey M. Depew, of New York, in which he promises to vote for the Grout bill. We felt sure that the eloquent tongue of Senator Depew would never roll over words in favor of oleo. The Senator is something of a farmer himself—an officer of the celebrated New York Farmers; of course he believes in killing the miserable grubs that torture the back of the good old cow!

*

How many middle-aged failures do you know? By "middle-aged failures" we mean men or women who have reached the prime of life, having had fair health and average opportunities, and yet have failed to secure competency and home. Take the list of such people within your acquaintance, and put opposite each name the known cause for the failure. We venture to say that a great majority of these failures will be traced directly or indirectly to the use of intoxicating liquor. We also believe that you will have the job of your life to find a life failure that can be honestly traced to the strict performance of duty.

*

ONE of the clearest demonstrations of the power and value of a live Grange is to be seen in the country around Lunenburg, Mass. Scattered through this country are numerous hill towns. In former years such towns, throughout New England, were usually prosperous. The little streams were fringed with factories and shops; the hillside farms produced fine crops of character, packed it into stalwart boys and brainy girls, and sent them out to do the world's work. As the inventors secured more and more of a monopoly of power in the valleys the wealth of the hill towns began to run down hill, like the water in their streams. In many places where there was little to tie farm families together this drain has gone on until farms and villages show the marks of desertion everywhere. At Lunenburg and nearby towns the Grange has largely stopped this drain. It has provided a strong social and business tie needed to make farm life brighter and more attractive. It is safe to say that no organization at present known could have taken quite the place of the Grange in saving these hill towns, and in preserving the best features of the old-fashioned New England home. In one way the Grange is seen at its best in New England.

*

WE have never liked the word "institute" as applied to the well-known meetings of farmers. It seems too formal, and does not seem to convey just the right meaning. Mr. Gold and Prof. Beal show us this week how the name first came into use, and it is now likely to stick, for 30 years of usage makes a strong glue for language. We do not pretend to be dictionary-makers, and there are apparently words enough now in our language, but we would like to see some simpler and more original word used in connection with meetings of farmers.

*

ON January 8 the House Committee on Agriculture at Washington gave a hearing to a committee of wholesale seedsmen, who argued against the Government free-seed distribution. They contended that the Government was interfering with private business. Seedsmen are drawing a comparison between the free-seed distribution and the ship subsidy bill, not at all complimentary to either. The fact is that the free-seed distribution is absolutely indefensible, as THE R. N.-Y. has stated many times before, and the only people vitally interested in it are a few Congressmen, who use the seeds as a political lubricant.

*

SENATOR Towne, the new Senator from Minnesota, will have but a short term in the Senate, but it will be bright with color for the cow if she can only get out of the Senate Agricultural Committee. This is what Senator Towne says:

> Of course, I believe that people who want to eat oleomargarine ought to be permitted to do so. I similarly believe that those who want to eat butter ought to be permitted to do so. Those who buy ought to know what they are buying, and the producer of butter ought not to be submitted to any other competition than that which would naturally exist between the two products on their merits.

The whole story is told in those 72 words. What the oleoists want to do is to sell a counterfeit. Never have lard and suet been of the same color as grass butter. They want to color these inferior fats and deceive the public. There you have the whole story—stripped of all their plausible talk about "poor man's food."

*

LAST year THE R. N.-Y. told of the great damage done to the wheat in Monmouth Co., N. J., by the Angoumois moth. This little insect took the milling value out of nearly 70,000 bushels of grain in central New Jersey. When the millers refused to handle the wheat something of a panic seized the farmers, and great loss was feared. After the article referred to was printed we began to get letters from poultrymen and stock-keepers asking whether this grain was good for feeding. Investigation showed that it was not badly hurt for feeding purposes, and most of it has already been sold at 62 to 70 cents a bushel, and regular wheat buyers handle it as feed. Thus this damaged wheat sells for about as much as the finest grain on the Kansas farm. In the thickly-settled portions of the East anything that has value for feeding animals or plants may be sold. Let us also remember that the New Jersey farms that produced this wheat have been in constant cultivation for more than 125 years—and still produce as many bushels of wheat per acre as the newer soils of the West.

*

THE Maine Pomological Society prepared a fine exhibit of apples and other fruits to be sent to the Buffalo Exposition. We understand that the Maine Legislature refuses to appropriate the money needed to show this fruit properly. If this report be true it is the most surprising thing we have heard of lately. The purest breed of Yankees left on this continent refuse a chance to advertise their wares! It seems impossible. The Maine apples are as fine in finish and flavor as any that can be grown inside the limits of this country—yet few, outside of parts of New England, know it. The people of this country are not running about to hunt up the best things. They are too busy earning the money with which to buy them. The producer must do the advertising, though the consumer often pays for it. California is a fruit-producing State, and the Californians are coming to Buffalo with money and men to crowd more of their fruit into the eastern markets. Much of this fruit, while large and handsome, is far inferior in quality to that grown in Maine orchards. Yet if Maine stands back with hands in pockets while California counts out a fair share of her roll for advertising purposes, California fruit will be demanded and sold. What in the world has become of the old Yankee genius for advertising? It will be a shame if that fine collection of fruit must be sold! Get after that Legislature!

THE article on Alfalfa printed in this issue, is of special interest to fruit growers or small farmers. To read what is said of this plant by western farmers one would think it was useful only on great farms where vast flocks and herds are kept. That is not true. It is also a blessing to the man with a few acres which are crowded hard with fruits or vegetables. As a rule, such a man does not keep much stock, and he cannot afford to have a large share of his land in fodder crops. Other crops pay better—yet the outlay for hay is considerable. Alfalfa gives a heavy yield per acre, and a comparatively small patch of it will furnish hay for the limited stock on a fruit farm. A few acres, which might not be suitable for the money crops, provide the fodder and save the hay bill. This is worth remembering wherever Alfalfa will grow. The only objection we have heard to the crop is the difficulty in plowing it when well established. The roots are large and tough, as one might expect, and the plow has a hard job among them.

*

MANY people are shocked at the disclosures of practices of nurses and others inside certain insane asylums. We are not much surprised at the stories told whenever a public cleaning occurs, for we have, unfortunately, been obliged to learn things about these institutions. Many of them are not asylums at all—they are jails for weak or broken-minded people. Most of them are elegant structures—the cost often running up into hundreds of thousands of dollars. In some cases honest efforts are made to cure the mental disease; in others the patient is regarded as a nuisance to be endured rather than cured. There are, unhappily, many thoughtless people who send friends or relatives to these palace prisons and then take no further notice of them. No wonder the attendants come to regard such patients as so many sticks of human timber! God help the poor nervous wretch whose mind is trembling in the balance, and who falls into the hands of some of these cold-blooded attendants! We think the plan of herding the insane and feeble-minded together in these great buildings is all wrong. They should be separated and classed and kept in small colonies on farms!

*

BREVITIES.

THE WHY MAN.

(Reprinted by Request.)

There was a man in our town and he had wondrous whys,
He went unto an institute—his talk was just this size:
"Say, mister, what is nitrogen and legumes—what are they?
And carbohydrate, oxygen and carbonate, I pray;
And what is an albuminoid, and what is chlorophyl?
And what are these bacteria you tell us how to kill?
Somehow it's worse than Greek to me, this learned stuff you said,
While these big, undiscovered words are buzzing at my head."
The people laughed, the chairman rose and pounded with his cane;
The wise professors wag their heads and look a look of pain.
They sat on our inquiring friend and ridiculed his whys;
And yet he had the right of it! The questions they despise
Were just the things he had to know ere he could understand
The matters they were driving at in speeches wisely planned.
And lots of those who laughed at him and ridiculed that day,
Knew less than he, but were afraid to "give themselves away."
And so they wisely wagged their heads at each big-sounding word,
Altho' they scarcely understood a fraction that they heard.
Chop up your scientific terms and deem it no disgrace
To make your science soluble at every talking place.

NO! NO! The "rest cure" never cured a case of laziness.

IT'S greed that makes some men substitute creed for deed.

IT looks like a sure thing that the quail will eat Potato bugs!

Is beardless barley worth sowing? Who can give facts about it?

HUMILIATING but true—the dollar is the best measure of friendship.

ONE of the best fruit reports we have ever printed on the next page.

THE food fraud and adulterator is the worst thief in the farmer's market.

A KNOWLEDGE of true principles ought to give a man more interest in agriculture.

MILK cans are sterilized by getting into hot water. Would that the same were true of the human tongue!

WE intimated last week that Senator Allen, of Nebraska, is against the Grout bill. We now learn that he favors it, and gladly correct the statement.

THE Baldwin apple was born in New England. Some things must be sent away from home to reach their best estate. Not so with the Baldwin. It is still the best red apple for its native heath.

MEN rise by what is put under their feet. They may put self there and stand securely. They may force others to build the pile, and find that sooner or later those who built will demand their own and pull down the pile.

Events of the Week.

DOMESTIC.—An earthquake shock passed through a portion of Missouri January 4. . . . . Eight men lost their lives by the burning of a lodging house at Minneapolis, Minn., January 6. . . . At Gibbstown, N. J., January 4, a dynamite explosion in a factory for explosives, killed three men. . . . . The families of a number of thrifty and peaceful colored farmers at Neelyville, Mo., have been warned to leave the county, or their homes will be burned and the occupants hanged. . . . . January 4-5, a great snowstorm raged over northern California and southern Oregon, blockading the railroads in many places. . . . . Fire Marshal Seery, who has been investigating the fire and explosion at the building occupied by Tarrant & Co., on Greenwich street, New York, in October, in which seven persons were killed and seven buildings destroyed, with a loss of $1,000,000, recommends that the District Attorney be asked to determine if there was any criminal neglect on the part of Tarrant & Co. Mr. Seery says that in the building there was stored 35 tons of chlorate of potash, 100 barrels of roll sulphur, 44 barrels of flour of sulphur, 55 kegs of chlorate of potash, 16 kegs of nitrate of strontia and 60 kegs of nitrate of potassium, and many other explosives. . . . A specific reward of $13,000 has been offered for Pat Crowe, the alleged kidnapper of young Cudahy, at Omaha, Neb. . . . . Frederick Northway, arrested in St. Louis, on a charge of blowing up a cable conduit with dynamite during the progress of the great street car strike last Summer, has been sentenced to eight years in the penitentiary. Maurice Brennan was sentenced to 10 years in November last. . . . . Nine armed bandits invaded the town of Cavette, O., January 3, and after terrorizing the citizens blew open a safe; they only secured $300. . . . . A boiler explosion wrecked a mill at Watseka, Ill., January 3, killing three men. . . . . A bill is being drafted in Indiana against kidnapping, which will provide for the death penalty or life imprisonment. . . . . The military board appointed by Secretary Root to investigate the death of former cadet Booz at West Point handed in its report January 8. There is no censure of Col. Mills, superintendent of the Academy, nor of any of the other officials. The cadets, however, are criticised for the extremity of their hazing, and hazing as practised at West Point is strongly condemned. One officer of the War Department, while declining to say what the report actually shows, expressed the opinion that the board did not find that Cadet Booz's death was the result of his treatment at the Academy. . . . . Fire in an orphan asylum at Rochester, N. Y., January 8, caused the death of 28 children, and injuries to 12 more. . . . . A tenement fire in New York, January 9, caused the death of four persons. . . . . A head-on collision between a light engine and a freight train, on a trestle near Morgantown, W. Va., January 8, killed six men. . . . . Three nurses at Bellevue Hospital, New York, have been indicted for manslaughter in the first degree, they having caused the death of an insane patient December 22, 1900, by pounding, bruising and choking him. The examination disclosed a horrible state of brutality in Bellevue, both doctors and nurses being utterly heartless. Political influence is the cause of these conditions. . . . . A decree has been signed in a Baltimore court restraining a packing firm of that city from selling fruit in cans bearing the label California, unless the fruit is the product of that State. . . . . Smallpox continues to appear in New York City and adjacent small towns. In Missouri, it has appeared in over 100 different places. New cases are developing in Chicago. . . . . P. D. Armour, the great Chicago packer, died in that city January 6, in his seventieth year. He was a New York State farmer's boy, made his first $100 by working as farm hand and village grocer's clerk; went west in 1852, and leaves an estate valued at $100,000,000.

CONGRESS.—The Senate committee on foreign relations, January 4, agreed to report favorably the reciprocity treaties with Nicaragua, British Guiana and Ecuador, and also a supplementary extradition treaty with Great Britain. . . . . The President sent a message to the Senate declining the request of that body for the transmittal of the Lawshe report on the Cuban postal frauds, for the reason that it is not deemed compatible with the public interests. . . . . In the Senate the consideration of the Army Reorganization bill was begun, that measure displacing the Ship Subsidy bill from its privileged position as unfinished business. During the debate the opposition Senators indicated that their line of attack upon the bill would be against the creation of a large permanent standing army. There was intimation that objection would not be offered to a temporary measure to provide an adequate force to maintain the authority of the United States in the Philippines. . . . . Delegates from the Philadelphia Pure Butter Protective Association were before the Senate Committee on Agriculture January 5 in support of the Grout oleomargarine bill. The speakers were Samuel Jamison, W. D. Edson, J. J. Habecker, W. F. Drennen, I. C. Cleaver, I. W. Davis, L. S. Kaufman, William Sharpless and T. C. Sharpless. They represented wholesale and retail butter dealers, farmers, creamerymen, etc., and all urged the passage of the bill as in the interest of health and the public welfare generally. . . . . The United States Senate, January 9, by a vote of 34 to 15, laid on the table the committee amendments to the Army Reorganization bill relative to the canteen. The effect of this vote is to abolish the canteen. The House considered the River and Harbor Appropriation bill, but made little progress. Several Western members assailed the bill for not containing provision for irrigation reservoirs, and Mr. Corliss, of Michigan, attacked it for not giving proper recognition to the Great Lakes deep waterway project.

FARM AND GARDEN.—John W. Springer, the millionaire president of the National Live Stock Association, was placed under arrest at Denver, Col., January 6, upon a charge of importing a docked horse. This is the first arrest of its kind in the history of the State. E. K. Whitehead, secretary of the Humane Society, signed his name to a bunch of affidavits filed with the information. He takes exception to the importation last July of the magnificent horse, Troubadour, and also to the steed's appearance at the Fall shows. The statute forbidding the docking of horses and their importation into Colorado became a law in April, 1898. Mr. Springer welcomes the prosecution as it will give him an opportunity of contesting the constitutionality of the statute for the benefit of horsemen and others who own docked horses.

The New Jersey State Board of Agriculture met at Trenton, N. J., January 16-18.

The International Consolidated Record Association met at Penn Yan, N. Y., January 15.

The dairy school at the Pennsylvania State College opened January 2 with 40 students. There were 71 applications for admission to the class, but it was impossible to find accommodations for more than 40. It is hoped to increase the facilities by another year.

At a conference of representatives of the horticultural and entomological departments of several eastern and north central States held at Chicago, Ill., concerning the methods of horticultural inspection work of their several States in progress under legislative authority, the formation of a National society of horticultural inspectors resulted. Prof. S. A. Forbes, State entomologist of Illinois, was elected president. This society will hold its next meeting at Washington, in connection with the annual convention of colleges and experiment stations. All persons officially connected with the inspection of nurseries and other horticultural property in the United States or Canada are eligible to membership.

The New York State Swine Breeders' Association will meet at Penn Yan, N. Y., January 15; secretary, H. E. Kline, Himrods, N. Y.

The Western New York Horticultural Society will hold its forty-sixth annual meeting at Rochester, N. Y., January 23-24.

The Connecticut Pomological Society will meet at Hartford, Conn., February 6-7; secretary, H. C. C. Miles, Milford, Conn.

The Pennsylvania Horticultural Society will meet at Harrisburg, Pa., Janury 21-22; secretary, Enos B. Engle, Waynesboro, Pa.

J. F. McNamee, representing the locomotive engineers and the labor federation of Columbus, O., made an argument before the Senate Committee on Agriculture, January 10, against the Grout Oleomargarine bill. He contended for the right of consumers to buy any article they might desire which was not deleterious to health.

The West Virginia State Horticultural Society and the State Sheep Breeders' and Wool Growers' Association will meet at Charleston, W. Va., January 29-30.

NEW JERSEY HORTICULTURAL SOCIETY.

NEW SMALL FRUITS.—The twenty-sixth annual meeting of the New Jersey State Horticultural Society was held at the State House in Trenton, January 3-4. The attendance was good, and much interest was manifested in the practical aspects of fruit and vegetable production. The fruit committee reported the crop of 1900 generally of poor quality and not very profitable. In raspberries, the Miller Red is driving the better-quality Cuthbert from market, on account of its brighter color. Loudon is not desirable for market on account of dull color and adherence to receptacle. Cumberland Black is not an improvement on Kansas in any essential particular. Among blackberries, Wilson is still favorite; Rathbun is very similar, if not identical, with Wilson. El Dorado, best new variety, vigorous, entirely hardy, heavy cropper, fruit very best quality. Erie and Lawton, best late varieties, but subject to root gall in south Jersey. Iceberg, the new California white blackberry, is no better than the old Crystal White, and neither amounts to anything. The Gladstone strawberry is found to be about the same as the Sharpless. Johnston's Early, a new berry from Burlington County, yields well and is as early as Michel. In Mercer County the following are commercially profitable; Tennessee, Gandy, on heavy soils; Glen Mary, Bismarck, Bubach and Pride of Cumberland. The Strawberry aphis, a small, blue species, works on the roots, and is increasingly destructive. Destroy them before planting by dipping roots in tobacco water. Thorough work is necessary. The query: "Does it pay to thin strawberries?" remained unanswered. In currants, North Star was reported very productive, but too small for market. The Early Rivers peach is profitable for near markets. Iron Mountain was declared identical with Ford's Late. Elberta is still best money-maker. The Black peach-louse, an old pest, has been troublesome in 1900. Many trees have it that are suspected of being infected with the yellows. It is more disastrous in some localities than scale. Tobacco answers on leaves, but not on roots. Meritorious apples of recent introduction are Mammoth Blacktwig, York Imperial, Langford and Stayman. Makefield apple, from Bucks County, Pa., supposed to be a bud variation from Smith Cider, is more valuable than the parent on account of color being all red, not splashed like Smith Cider. Tree is similar in all respects. Turn-of-Lane, an old variety from Salem County, is small and bright red, a late keeper, and of superior quality, little disseminated away from place of origin. Ben Davis is most extensively planted, and is the best money-maker.

THE KIEFFER PEAR.—A most interesting debate followed the reply of President D. D. Denise to the question: "Is it advisable to plant more Kieffer pear orchards?" President Denise said the tree is a nice, rapid grower, bears young, and is less subject to blight than other varieties; quality is much improved of late years, and now equal to some others; 25 per cent of the orchards set are neglected and never come into bearing. The local markets are overstocked, but there is a good distant demand. His little orchard of 1,200 trees has made more money than the remainder of farm. Prices no lower than best apples, and the yield is greater. In 1900 the trees yielded over 200 barrels per acre, at net profit of 50 cents per barrel, or $100 per acre. Neighbor with neglected orchard shipped ungraded Kieffers and got only *seven* cents per barrel net return! Best and highest-colored fruit is grown on land not too rich. Should be planted from 20x20 to 35x35 feet apart for best results. Every second year in poor soils should have 1,000 pounds or more of good commercial fertilizer. Must always have good culture, thorough pruning and thinning. Should be picked and put in storage as soon as the fruit will separate from stem. J. S. Collins, the largest Kieffer pear-grower in the State, said that the prices in 1900 were very low; could not dispose of all his crop in southern part of State. Discussion brought out the opinion that the canning test of 1899 was of no value, as many of the heaviest canners used a chemically-prepared sweet, with 50 times the strength of sugar, to save expense. This was satisfactory when first put up, as the color was better than when sugar was used, but later the preparation attacked the cans, giving a tinny taste to contents, and even ate holes through the cans, causing a total loss. One packing firm lost $50,000. Those canned with sugar found a good market, though the chemically-prepared stock injured the sale of all; and doubtless caused the decline in value of Kieffers in south Jersey last Fall, as the chemical tests were largely made in that portion of the State. Kieffers, picked when two-thirds grown, and ripened in the dark, were of best quality, but carried to market poorly. Rust or clouding of the Kieffer received considerable attention. It is thought to be a weakness inherent in the Japan pears, as their skin is thin and tender, and is not caused by insects. Late frosts in Spring, after fruit is set, early frosts in Fall, excessive spraying, too thick foliage and lack of pruning were given as causes. It consists of a corky growth, favored by lack of ventilation. It will remain, but care, culture and pruning to let in sunlight will lessen it. The crop of Kieffer pears in New Jersey is 10 times as great as all other varieties. Other good pears are Manning's Elizabeth, Clapp, Bartlett, Seckel, Duchess, Anjou and Lawrence, in order of ripening. They sold at $2 to $3 per barrel, while Kieffer did not bring more than $1.25 on the average.

PLUM CULTURE.—Two papers on plum culture, by David Baird and William Skillman, excited much interest. It was agreed that no European plum except the Lombard could be grown with profit in New Jersey. The trees grew well and set fruit regularly, but rot and the curculio so reduced it that practically none matured for market. The Lombard is a moderate success, but shows the same faults. No American plum except the Wild Goose has returned profit as yet. In many sections it does not bear unless pollinated with Cumberland. The Japan plums are the only money-makers. A number of varieties have been fruited and discarded. Red June, Abundance, Burbank, Satsuma and Chabot are liked. They are named in order of ripening. Hale, for home use, Wickson and October Purple are thought worthy of planting for further trial. The great defects of the Japans are the tendency to overbear and their susceptibility to brown rot. Bearing trees set five times as many plums as they can bring to maturity. Thinning must be thoroughly done if good fruits are expected. They should not hang closer than two inches apart. A very effective and practical way is by shaking the trees vigorously when plums are the size of a hickorynut. May be repeated several times, and then the tendency will be to leave too many fruits on the tree. Thinning makes size and checks the rot. The trees must be severely pruned. Thorough thinning and pruning will do more to limit rot than spraying which many consider not only useless, but injurious to the foliage. Curculio does not injure Japans, and is considered to be a benefit by reducing number of fruits. The fruit should be picked as soon as it shows color, as some varieties drop. They can be picked before coloring and color on way to market, but quality is injured. Peaches can also be well thinned by shaking.

KILLING THE SCALE.—The San José scale received much attention. Prof. J. B. Smith, State Entomologist, said it was here to stay, and in five years every peach tree and Kieffer pear tree would require special attention. The scale came from Japan and China, and the older Japanese imported trees were more resistant than American-grown stock. The scale often dies on the imported trees. New remedies must be found, as there is no effectual parasite. In time resistant varieties of fruits will be developed. J. H. Hale, of Connecticut, said that the Pernicious scale was the greatest blessing that could happen to fruit growers, as it forced careless cultivators out of the race. No one agreed with this conclusion, but thought it a serious menace. Crude petroleum has been largely used, with generally good results. Mr. Emmor Roberts used petroleum extensively, spraying 3½ acres of apples, using 10 barrels of petroleum. He thinks it often benefits the trees by killing fungi and other insects besides the scales. The petroleum killed many cherry trees and injures peaches frequently. Some apples are more susceptible to the effects of petroleum than others. Yellow Transparent and Wealthy are easily injured. Baldwin, Smith Cider, Cornell Fancy, York Imperial, Gravenstein and Ben Davis not affected. Ohio Pippin and Williams Early died, but were badly weakened by lice and scale previous to the application. The cut surfaces of pruned trees should be painted over before applying petroleum. Some difference of opinion was elicited as to method of spraying. Prof. Smith advised a bunch of two or three nozzles. Mr. Roberts says he uses a single nozzle, and takes advantage of high winds, spraying down the wind. He often covers more than the tree operated on by this means. A unique recommendation was made by H. T. Jones, of the flower committee, to plant the native holly by the acre to cut when in berry for Christmas greens.

NEW JERSEY VEGETABLES.—The vegetable committee reported great loss from the pea-louse. It is estimated that 75 per cent of the whole value of the crop was lost. First and second-early peas not much injured. The insect did not appear in force until nearly the middle of June. The first peas from New Jersey were marketed May 25. The pest can be controlled by careful spraying. J. Brackley, a canner, near Freehold, N. J., planted 1,436 acres of peas, 275 Lima beans and 100 acres of spinach; used 3,250 bushels peas for seed, at the rate of 2¼ bushels per acre; applied 543 tons of fertilizers at rate of 600 pounds to the acre; used 18 two-horse sprayers, as it was the first place in Monmouth County where the louse appeared. He used whale-oil soap solution. The sprayers lifted the vines and covered the lice with solution. Where peas were not sprayed the entire crop of the medium and late varieties was lost. As with the Potato beetle, it is necessary to have everything ready. Cabbages suffered severely from green worms which even attacked lettuce, spinach and celery. One grower in Essex County failed to get a good head from 10,000 plants. Total cabbage crop scarcely 25 per cent of an average, but quality excellent. Growers must now base prices at what it can be grown for elsewhere; $4 per ton pays very well. Tomatoes were a fine crop, though injured in localities by Tobacco worm. In northern part of the State Stone and Beauty are the favorites; in the southern portion, Stone and Paragon are preferred. Perfection is still grown somewhat. Acme grows well in dry weather, but spots too much. Conqueror is extensively planted for very early, and does well on light soils. Dwarf Champion is early and of good quality, but is a weak grower and requires a strong soil. Potatoes, generally only one-third of a crop. The sweet-potato crop was the largest ever grown. Storage houses for sweet potatoes will not pay this year. Direct shipments as far west as Denver have paid fairly well. Sweet corn was of fine quality but injured by Corn worm. Prof. Byron D. Halsted related some interesting results of crossing varieties of sweet corn, dwarf Lima beans, egg plants, tomatoes and the cultivated salsify with the native wild species. He evidently has some good things under way. Prof. E. B. Voorhees, also of the State Experiment Station, made a strong plea for irrigation of garden and fruit crops in the East. He claims that it is only necessary to supply the deficiency of the seasonal rainfall, and not to furnish the entire amount of moisture needed as in the West. When the natural facilities are good a plant, not exceeding $600 in cost has been sufficient to irrigate several acres in New Jersey. W. V. F.

Woman and Home

From Day to Day.

Ah, mother's gettin' old and gray;
Some day, why, she'll be laid away
Down in the field by th' old mill stream,
Where all the roses love to dream.
And when thet happens, like ez not,
The old farm'll jest 'bout go to pot;
We'd lose all hope, ef ma was gone,
Fer she most runs the farm alone.
Up with the sparrers every morn,
Callin' the chickens to their corn;
She cooks a meal I wouldn't trade
Fer the finest farmhouse ever made;
She cleans th' house an' sets the hen,
An' shoos the pigs back to their pen;
She feeds the cow, an' then she goes
Inter th' house, an' sews, an' sews,
An' bakes a cake, an' runs th' churn,
An' gathers in th' wood t' burn;
An' ef you say, "Ma, rest awhile!"
She'll answer, with her old sweet smile,
"Child, I ain't tired a bit. Are you?
We can't rest when there's work to do."
An', supper o'er, the chores all done,
She hears our lessons, one by one,
An' then she sees th' cat is fed,
An' puts the children all to bed,
An' when th' family's tucked away,
Then she, alone, kneels down to pray.

* * * * *

Yes, after all is said and done,
Your mother is the only one.

—Success.

*

MUSHROOM pink is one of the new colors of the season. It is a very soft, delicate tint, and is as attractive in flannel or albatross as in silk, being much used for waists. Pink waists are very often trimmed with gilt buttons and braid, small flat buttons finishing little straps on the stock collar when they do not appear on any other part of the waist.

*

A MAN in Norton County, Kas., has been receiving from the State, for the period of 14 years, 50 cents a day for the care of his insane wife. When the woman was adjudged insane there was no room for her in the State Asylum, and by an arrangement authorized by law for the care of insane persons, the local authorities gave her into the keeping of her husband as a charge upon the State. There were so many of these cases that the State Auditor recently suggested that they be sent to the asylums. The first response came from the Norton County man, whose wife refused to go to the asylum. Upon inquiry it was revealed that the woman's insanity was soon over, and that for years she had been keeping house for her husband, who all the time had been putting in quarterly claims of 50 cents a day. Of course, this pay was discontinued, but it is said that a similar fraud has existed in several cases.

*

WHAT we describe as obstinacy in the character of others we are very likely to consider merely determination in our own. The Youth's Companion tells this little story of a New England couple who possessed the quality referred to in excess:

The lady had been bereft of one helpmeet, and her second husband had twice been left a widower, before the pair were united in the bonds of matrimony. They were both of that temperament which causes its possessor to be characterized as "set.' On the wedding-day the bride found in the back entry, on a conspicuous nail, a sunbonnet which had belonged to her immediate predecessor. She removed it to oblivion in a closet. Her newly-wedded husband made no comment, but replaced the sunbonnet on its accustomed nail. During the next few days the calico head-gear vibrated with more or less regularity between the closet and the nail. Then there came a day when the bride approached her husband with a man's hat in her hand, as he was in the act of reinstalling the sunbonnet.

"If you have that sunbonnet there," she said, firmly, "I shall hang up my first husband's hat on the next nail."

She looked at the bridegroom, and met the counterpart of her own expression. She hung the hat on the designated nail, and although the two people lived to be very old, neither the hat nor the sunbonnet ever moved again till the house came into the hands of a new owner.

*

THE Youth's Companion tells this little story relative to the habits of some unrestrained and untrammeled hens:

Ephraim Knox lived in the center of his native village, and his hens wandered here and there at their own sweet will, to the frequent annoyanee of his neighbors. Ephraim, however, was no respecter of persons, and considered his hens "as good as anybody," and desirable visitors.

When it was decided that the town library should be built in a vacant lot "next door to him," Ephraim was filled with pride and joy, and he and his hens superintended operations from the first.

Ephraim's brother Seth was not devoted to hens. One day he was passing the site of the library with a friend and stopped to view the progress of affairs. Ephraim's hens were there, cackling away as if their lives depended on it. Seth looked at them in disgust.

"What in the world are those hens making such a noise for, do you suppose? There ain't any grain in there," said the friend.

"Well," remarked Seth, dryly, "they've had the oversight of 'most everything in town. You know the cornerstone of the building was laid yesterday, and I calc'late that speckled hen over there thinks she laid it!"

*

THE day after Christmas several of the big New York stores opened their display of washing shirt waists. This has come to be a rule now; as soon as the holiday shopping is over the Spring goods are displayed. It is rather trying to belated shoppers who still wish to buy some Winter garments, for there is a very scant selection to choose from. The wash waists so far shown differ very little from the Winter models, the bishop sleeve, with shallow cuff, being a marked feature. In pattern of material, stripes seem to predominate. The white waists show the same marvelous combinations of lace and embroidery seen in the first display last year, but

3692 Child's Long Coat
2, 4 and years.

they are so hard to launder that they never became popular. The rich woman is almost as badly off as the poor one when away from home, where she must trust to unknown laundresses, and it is amazing how many badly-ironed shirt waists one sees. Bolero effects are seen on many of the new waists, and the sailor collar seems likely to be quite as popular as it was last Summer.

*

A WOMAN in New York has brought a $5,000 damage suit against a druggist, because he sold her a substance that changed her hair to a vivid green. She wished to alter her golden hair to auburn, and was advised to use henna leaves; the result was a crown of vernal sea-green tresses which, while appropriate to a mermaid, are distinctly embarrassing in any other capacity. The druggist claims that henna, being a harmless dye, is sold without question in the ordinary course of trade, and that he is not responsible if the purchaser trifles with nature with embarrassing results. This brings out the fact that most city druggists are insured by a guaranty company, which defends them and conducts the case when lawsuits are brought against them in consequence of mistakes made by employees. A certain premium is paid for each clerk, and the plan is profitable to the guarantor, and a saving of trouble to the druggist.

The Rural Patterns.

The child's coat illustrated is especially suitable for the baby just promoted into short clothes, but may also

3702 Home Gown.
32 to 42 in. bust.

be worn by children from four to six years old. As shown the material is Russian blue broadcloth, with trimming of soft gray chinchilla; but younger children wear white bengaline, peau de soie, drap d'ete and velvet, corduroy or velveteen can be substituted for the cloth when the child has reached the mature age of four years. Fur is much used as trimming, but narrow frills of ribbon and stitched bands are entirely correct. The skirt portion is laid in box pleats, two at the front and two at the back, and is attached to a short fitted body. The double capes fall over the shoulders, the upper one being cut in points at the front. At the neck is a turn-over collar. The sleeves are full, in bishop style, and are finished with straight bands or cuffs at the wrists. The coat closes at the center front, where it is supplied with ornamental buttons and buttonholes. To cut this coat for a child of four years of age five yards of material 21 inches wide, 4⅛ yards 27 inches wide, 2⅝ yards 44 or two yards 50 inches wide, will be required. The pattern No. 3692 is cut in sizes for children of two, four and six years of age, price 10 cents from this office.

The simple, but well-modeled house gown shown fits closely at the back, but is free at the front, where it is held by a ribbon at the waist. The shaped backs and under-arm gores give an effect of slenderness and grace, and the soft folds of the front are universally becoming. As shown the material is cashmere in dahlia red, but flannel, flannelette and all washable stuffs are equally appropriate. The princess back, with under-arm gore, fits smoothly, but the full front is made over a short lining fitted with single darts. The sleeves are two-seamed, and roll over to form cuffs at the wrists. The neck is finished with a simple turn-over collar that can be omitted when desired and one of linen worn in its stead. To cut this gown for a woman of medium size 8½ yards of material 27 inches wide, 7½ yards 32 inches wide, or 4¾ yards 44 inches wide, will be required. The pattern No. 3702 is cut in sizes for a 32, 34, 36, 38, 40 and 42-inch bust measure, price 10 cents from this office.

Headquarters, No. 96 Fifth Avenue, New York.

Society Motto—"Good Cheer."

Colors—Yellow and White.

Flower—Coreopsis.

Society Song—"Scatter Sunshine."

Though the midnight found us weary,
The morning brings us cheer;
Thank God for every sunrise
In the circuit of the year.
—Margaret E. Sangster.

THE largest branch of the Sunshine Society comprises over 2,300 members. It is composed of young folks, and the members are scattered all over northern Michigan, the president being Mrs. M. E. C. Bates, of Traverse City. The rules of this branch are as follows:

"I will try never to worry or fret about anything.

"I will try to be as happy as I can and to make everybody happy as far as I can.

"I will try to be loving, helpful and kind to everybody and to every living thing.

"If I ever fail in trying to do these things, I will 'try, try again.'"

These rules are printed on a membership card and are signed by each member upon joining the club. They are very good rules for anyone, whether a Sunshine member or not.

* * *

"I BELIEVE," said an energetic little Sunshine woman, quoted in the New York Mail and Express, "that I have a great deal of cork in my nature." And she nodded a merry good-by to a puzzled group who turned a lifelong friend of her, asking what she meant.

"That is certainly one way of expressing it, and a good one too," she said. "It is cork. And I hope you have it in your natures, too. Perhaps you call it by another name, 'cheerfulness' or 'sunny temper,' qualities which the dear God bestowed on us not alone to make our own lives happier, but to brighten up the paths of others.

"Ever since this dear Sunshine woman was a young girl things have gone against her. She has had to fight the fight herself, whereas all you young people have a father, mother or brothers to help you in the battle.

"But Margaret has fought alone, and bravely, and made the most of her happy disposition, thereby smoothing an otherwise rough path. Disappointments? My dear girls! Perhaps the greatest disappointment of your lives was to have the rain fall when you wanted the sun to shine. But Margaret has encountered more serious obstacles. But she never gave up to despair. She simply began again, or, as she expressed it, "Bobbed up again." That's what she meant by the cork in her nature. You all know that if you throw even the tiniest bit of cork upon the surface of the water it will bob up at once. No matter how high the waves, it will always keep on the top. So it has been with Margaret.

"I am sure that there is some of this sunny buoyancy and cheerfulness in the nature of every one of us. It may be latent, but that is all the more reason we should draw it out and make it a help to all with whom we come in contact. Don't you think each of you has it in some degree, and if you have, why not make the most of it?"

The Farmer's Fare.

A handful of questions that fell to my share to answer from the question box of a recent farmers' institute in New York State may be of interest to the readers of THE R. N.-Y.

Is there anything that can be used in the place of eggs when they are 30 cents a dozen?

Nothing will take the place of eggs in angel cake, sponge cake and custards, therefore in midwinter let us make the suet puddings, the apple tapioca, and the creamy rice pudding, and have raised cakes, buns, cookies and good molasses gingerbread. Then in the Spring, when eggs are cheap again, we shall enjoy the custard pie and sponge cake all the more for having gone without them for awhile. I have very little sympathy with the sham sponge cakes and custards where baking powder in the one case and cornstarch in the other are used as vain substitutes for eggs; short cakes and plain cornstarch puddings are far better. When we compare eggs with meat, however, we shall see that even when Winter prices prevail they are not more expensive than the choicer pieces of meat. Eight good-sized eggs weigh a pound, and at 30 cents a dozen would cost 20 cents. There is little waste and little fuel or time is required to prepare them. Compared with a pound of beefsteak or lamb chops the eggs are not so costly as we sometimes think.

What shall we farmers' wives do for dinner when we have no meat but salt pork and codfish?

One great lack in the country, where of all places there should be abundance, is in variety of vegetables and a knowledge of their possibilities. The nutritive value of our common vegetables like cabbage, carrots and parsnips, can be increased by a judicious addition of milk, eggs and butter. The cabbage can be served with a salad dressing, the carrots with a white sauce and the parsnips after boiling can be sliced, dipped in butter, and fried in the salt pork fat. These taken in turn with the salt pork and potatoes, and a good pudding, will make a substantial meal. Again, have some fried apples with the salt pork and a dish of macaroni and cheese. The macaroni is cheap and appetizing when carefully cooked. It is first put into boiling salted water and cooked tender—a half hour or less—then it is drained, and rinsed with cold water, and cut in convenient pieces. A buttered pudding dish is then filled with alternate layers of the macaroni and chopped or grated cheese, perhaps a cupful of the cheese to a quart of the cooked macaroni. Season with salt and pepper, fill the dish with milk, and cover with bread or cracker crumbs mixed with a little melted butter, and bake in a moderate oven for nearly an hour, or till the macaroni absorbs most of the milk. The cheese will supply the proteid matter lacking in the fat pork. Boiled rice or macaroni in tomato sauce is another inexpensive food which is easily prepared.

The salt fish can be varied by combining it with milk and eggs in several different ways.

How are milk soups made?

The various soups known as cream of this, that and the other thing are usually about half milk and half meat or vegetable stock, slightly thickened with flour which has been blended with fat. For example, the tough, flabby portions and white leaves of a bunch of celery might be cut in small pieces, mixed with a sliced onion, covered with cold water and cooked until much of it can be rubbed through a strainer. To this juice and pulp is added an equal portion or even more of hot milk. For thickening a quart of soup slightly, one ounce of butter and one rounding tablespoonful of flour should be cooked together in a small saucepan until frothing, then add a little of the soup and beat until smooth, and then mix with the whole. Season with salt and pepper. For a thicker soup use twice as much flour and butter, though the butter may be decreased slightly. However, if we use skim-milk for the soup, as we may, the increase of butter is desirable. Such soups can be made from almost any vegetable, varying the thickening according to the thickness of the pulp of the vegetables. Bean and pea soup require less flour, but a little will keep them from becoming watery on top. A corn chowder can be made much like a fish chowder from fresh or canned corn with pork fat, onion and potato. Such soups are excellent for supper on a cold night, and give an opportunity to turn skim-milk to good account.

A Market for Chinch Bugs.

The Youth's Companion tells how a man who kept a little store in a western town was one morning approached by a farmer who owed him a small account, with a plea for an extension of time, as the chinch-bugs were eating up all the crops.

"Chinch-bugs! Nonsense!" said the the storekeeper, roughly. "I don't believe there's a chinch-bug within a mile of you."

"The chinch-bugs are there by millions."

"Millions! I'll tell you what I'll do. I'll give you a dollar and a half a gallon for every gallon of the bugs you'll bring me."

"Done!" said the farmer.

A day or two after he drove back to the village with a ten-gallon can tightly covered. This he unloaded from his wagon, and rolled carefully into the general store.

"What have you got there?" asked the merchant, suspiciously.

"Something for you."

"What is it?"

"Chinch-bugs," said the farmer. He lifted the lid and disclosed a mass of the hideous insects, wriggling and squirming.

"There's ten gallons of them," he continued. "I take it you owe me fifteen dollars. That will just about square my little bill, and I'll thank you to give me a receipt."

"Cover it up for goodness' sake, before any of 'em get away!" roared the unhappy dealer.

But he wrote the receipt so justly forfeited.

The story came out in the papers, and for months thereafter the storekeeper received letters asking for the latest quotations on the price of chinch-bugs, and inquiring how many he was prepared to take.

However, he had nothing to regret, for, as he said, the experience was worth a thousand dollars to him in advertising.

WHEN you write advertisers mention THE R. N.-Y. and you will get a quick reply and "a square deal." See our guarantee 8th page.

THE plague of lamps is the breaking of chimneys; but that can be avoided. Get Macbeth's "pearl top" or "pearl glass."

The funnel-shaped tops are beaded or "pearled"—a trade-mark. Cylinder tops are etched in the glass—"MACBETH PEARL GLASS"—another trade-mark.

Our "Index" describes *all* lamps and their *proper* chimneys. With it you can always order the right size and shape of chimney for any lamp. We mail it FREE to any one who writes for it.

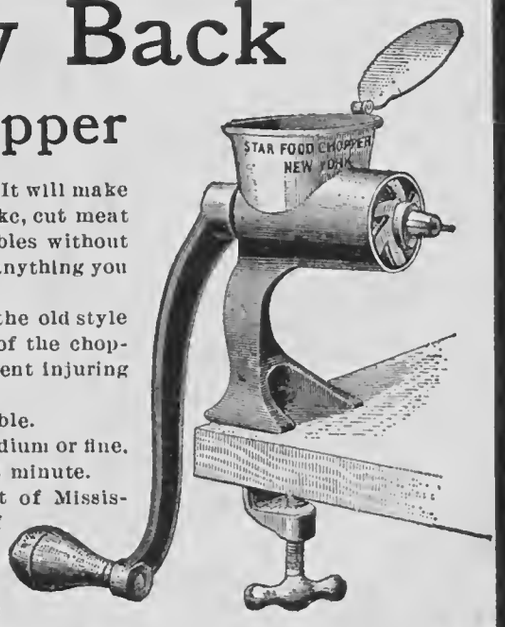
Your Money Back

if the Star Food Chopper



is not just what you want and all you expected. It will make your mince meat, cut your raisins and citron for cake, cut meat for your sausages, chop poultry, fruit and vegetables without mashing, **and grind your coffee.** It will make anything you now make with a chopping knife and bowl.

The **Star Chopper** has many advantages over the old style machines, among which is a plate hinged at the top of the chopper to press the food into the machine, and prevent injuring or soiling the fingers.

Knives require no sharpening—simple and durable.

Three sizes of cutters for chopping coarse, medium or fine, furnished with each chopper. It chops two pounds a minute.

I will send a **Star Chopper** to any address, east of Mississippi River, express prepaid, on receipt of $1.25. If you are not satisfied, your money back.

Send for full description.

CHAS. D. BROWN, 24 Hudson St., NewYork.

MARKETS.

REVIEW AND OUTLOOK.

BUTTER is down one cent from last week, and business is dull for everything except the choice grades. There is a surplus of ordinary stock, which in some cases is being offered at cut prices.

GRAIN.—Wheat is 1½ cent above last report on account of Hessian fly damage and unfavorable news from the South American wheat belt. Corn is also a trifle higher. The rains and muddy roads in the corn States hinder the movement of the crop to market. Oats are firm, and the stocks in hand light. Trade in rye and barley is dull.

HOTHOUSE PRODUCTS. — Mushroom trade is dull, there being but little call for anything but the better grades. Western rhubarb and asparagus are doing very well. Few of the cucumbers received are good enough to reach top prices. Lettuce is also inferior. As a general rule hothouse products of low grades will scarcely pay for shipment.

BUSINESS BITS.

A LETTER from the Inspector-General of the Paris Exhibition dated November 9, 1900, highly compliments the Reliable Incubator & Brooder Co., of Quincy, Ill., on their interesting and instructive exhibit. It would seem that the Reliable people took the lead at Paris.

MORRILL & MORLEY advise fruit growers not to experiment with spray pumps. Both these men are large fruit growers and have done the experimenting for you on their own orchards. Write to Morrill & Morley, Benton Harbor, Mich., and learn about the Eclipse spray pump.

WE have had many letters from subscribers asking where they could buy the kerowater sprayer so often spoken of in THE R. N.-Y. We now refer all interested to our advertising columns, which contain an announcement of the manufacturer, The Gould Mfg. Co., Seneca Falls, N. Y.

MANY of the faults of driving horses are due to improper bits. A harsh bit in a tender mouth will impel the animal to do all sorts of antics, and many make the mistake of putting a harsh bit in the mouth of a hard-headed horse. The Imperial bit will control the most vicious horse with ease, and at the same time will not injure the most tender mouth. Write the Imperial Bit and Snap Co., 400 Wis. St., Racine, Wis.

INFORM yourself as to the needs and requirements of your fowls; read "How to Make Poultry Pay," by E. C. Stearns & Co., Box 20, Syracuse, New York. This valuable book is sent free of charge to all who apply for it, and the information therein is founded upon the experience of some of the best and most successful poultrymen of the day. Much information is given as to the value of green cut bone and the best manner of preparing it with a Stearns bone cutter.

THE most approved method of marking cattle, sheep and swine for positive identification is by use of Dana's white metallic ear labels, as years of successful use by thousands of the best breeders and farmers and over 40 recording associations has thoroughly proven. The owner's name or address and consecutive numbers appear on the Dana labels; their application is easy, their permanence assured. For sample or agency write to C. H. Dana, West Lebanon, N. H.

INFORMATION is wanted about hand hay pressing. During the late war I bought and had pressed with hand presses (and horse) several hundred tons, sold to the Government. We would get from three to five tons pressed a day, according to the men working. Good hand presses can do a very good job. If the hay is in barns or sheds it can be pressed at odd times.

Marietta, O. S. S. T.

The price of cows to come fresh between now and April 1 is about $30 for fairly good animals, and from that up. There have been a good many culls sold cheap, but good ones have brought good prices. I was raised on a farm and have been farming for myself more than 50 years, and have never seen so continuous a drought during a whole growing season as the one just passed. The first real wetting to start springs and streams was about December 1. In some localities only a few miles away conditions have been very much better.

E. Masonville, N. Y. W. I. B.

SKIM-MILK CALVES.—A writer in the Pacific Rural Press praises the Holsteins for feeding calves. He says: "A short time ago I sold a grade Durham and Holstein calf (sire a purebred Holstein), raised on skimmilk and a little oil meal, which brought me $9.50 at 8½ cents per pound when six weeks old. I tried to repeat the experiment with a better-bred Jersey calf, and did well to have it come out alive. That is where the virtues of the Holstein come in play. They are docile and easily handled, good feeders, and lack the daintiness and nervousness of the Jerseys; they respond wonderfully to good treatment."

WHEN you write advertisers mention THE R. N.-Y. and you will get a quick reply and "a square deal." See our guarantee 8th page.

Asthma Can Be Cured.

Statement of a Noted Physician.

The astonishing statement that Asthma can be cured, coming from so well-known an authority as Dr. Rudolph Schiffmann, will be of interest to sufferers from Asthma, Phthisic and Hay Fever. The Doctor's offer, coming as it does from a recognized authority, who during a practice of over 30 years has treated and cured more cases of Asthma and its kindred than any living doctor, is certainly a generous one and an innovation in this age of countless fraudulent nostrums. Believing that the honest way to sell a remedy is to let those who would buy convince themselves of its merits before purchasing. Dr Schiffmann has authorized this paper to say that he will send a free trial package of his remedy, "Schiffmann's Asthma Cure," to any sufferer who sends his name on a postal card before March 10th. This remedy has cured thousands of cases that were considered incurable. Being used by inhalation it reaches the seat of the disease direct, stops the spasms instantly and insures sweet and refreshing sleep. A free trial package will convince the most skeptical. Those desiring to try a free sample should address Dr. R. Schiffmann, 349 Jackson Street, St. Paul, Minn

Wants, For Sale or Exchange

FOR SALE—Traction Engines and Thrashers, 2nd hand, cheap. F. A. Booth Co., Stanley, N. Y.

WANTED—A position as overseer on a fruit or dairy farm, by young married man, German. Good references. Address Box 70, North East, Pa.

Farm Managers, Gardeners, Buttermakers, etc., always on hand. No charges to employers. Write us. Rural Science Agency, Durham, N. H.

WANTED—Party to ship me fresh Butter and Eggs weekly. Address JAS. F. MARBARGER Drchersville, Schuylkill County, Pa.

Valuable Fruit Farm and Country Home, desirably located. Bargain. F. A. CHAPMAN, City Building, Wellsburg, West Va.

As Manager on Poultry Farm by a practical man of large experience. CAPABLE, care The Rural New-Yorker.

FOR SALE—Farm of 247 acres, five miles from Battle Creek, Calhoun County, Mich. Good buildings, barn and improvements. H. B. McGRAW, 917 Williamson Bldg., Cleveland, O.

WORKING FOREMAN wanted March or April 1, on a farm of 200 acres; one who understands care of live stock. Give age, number in family, experience and wages expected.
Address H. P. A., care of this paper.

WANTED.—A horticulturist of large experience, desires to engage with a commercial orchard dist or company expecting to plant largely of peach, apple, or pear. Would engage with a railroad or other corporation needing a man of this kind. SAM T. KENYON, 823 Galia St., Portsmouth, O.

FOR SALE.

An Ohio Farm of over 200 acres, one of the best in Wayne County, Ohio; good grain and stock farm; none better; about 20 acres of No. 1 timber; good buildings; good fruit; two orchards; tenant house; fish pond; gravel soil. On state road, two miles from railroad, and town of 1,000 and 2,000 inhabitants; near school and church. Price, $13,500; time given; int. 6 p.c.
F. A. LEISER, Room 516, Everett Bldg., Akron, O.

GLENN RANCH,

Glenn County, California,

FOR SALE IN SUBDIVISIONS.

This famous and well-known farm, the home of the late Dr. Glenn, "the wheat king," has been surveyed and subdivided. It is offered for sale in any sized government subdivision at remarkably low prices, and in no case, it is believed, exceeding what it is assessed for County and State taxation purposes.

This great ranch of 40,000 acres runs up and down the western bank of the Sacramento River for 15 miles. It is located in a region that has never lacked an ample rainfall, and no irrigation is required.

The river is navigable at all seasons of the year, and freight and trading boats make regular trips.

The closest personal inspection of the land by proposed purchasers is invited. Parties desiring to look at the land should go to Chico, California.

For further particulars and for maps, showing the subdivisions and prices per acre, address personally or by letter,

F. C. LUSK,

Agent of N. D. Rideout, Administrator of the Estate of H. J. Glenn, of Chico, Butte County, California.

Jacks for Sale.

A fine lot of No. 1 Jacks, two to seven years old, 14 to 16 hands high, extra well bred and guaranteed. Come or write at once.
J. BAKER, Lawrence, Ind.
8 miles northeast of Indianapolis, 1½ mile from Traction line.

Horse Owners Conjure By It.

A moment's investigation make luminous the fact that these words are full of potent meaning—that this ointment is as different from the harsh, gritty and poisonous substances called remedies, as day is to night.

VETERINARY PIXINE is as smooth as oil. It's absorbent, penetrating, antiseptic healing power is absolute. It is the only pharmaceutical, scientific veterinary ointment. It cures scratches, speed cracks, grease heel, mud fever, sores and skin disease of years standing, that resists every known treatment. It is guaranteed; money back if it fails.

2 oz., 25c.; 8 oz., 50c.; 5-lb. pkge., $4.

Includes expensive 1901 Almanac and Manual of Information. Handsomely illustrated. Invaluable for a lifetime. Not a patent medicine book.

At all Druggists and Dealers, or mailed postpaid

TROY CHEMICAL CO., Troy, N.Y.

COOK YOUR FEED and SAVE Half the Cost—with the PROFIT FARM BOILER
With **Dumping Caldron.** Empties its kettle in one minute. The simplest and best arrangement for cooking food for stock. Also make **Dairy and Laundry Stoves, Water and Steam Jacket Kettles, Hog Scalders, Caldrons, etc.** Send for circulars.

The Premiums.

The contest closed on January 15. Clerks are making up records, and club-raisers will get their checks as soon as the records are complete. Here is the list for last week:

Jan. 7. Jay E. Allis, New York.
Jan. 8. Jay E. Allis, New York.
Jan. 9. Mrs. C. B. Curtis, New York.
Jan. 10. Jay E. Allis, New York.
Jan. 11. Jay E. Allis, New York.
Jan. 12. Mrs. C. B. Curtis, New York.

We yet have liberal rewards for those who get up clubs. Send for them. Four names and $4 get your own paper free, the five for $4. Do not worry if that date on label is not changed promptly. We are a little behind with book work on subscriptions, but every remittance received is entered up daily, and the credits will appear on label shortly.

THE RURAL NEW-YORKER.

Market Briefs.

PICKED UP HERE AND THERE.

THE APPLE MARKET, for anything except the better grades, is weak, and conditions favors buyers. Some of the choicest cold-storage stock is held at prices above quotations, but such cases are exceptional, and $2.50 is the top notch for ordinary ice-house apples. I have noticed a good many Newtown Pippins. Fair-sized ones retail on the fruit stands at three for five cents, and the quality at this season of the year is excellent. While some of the earlier varieties have already lost their fine flavor, the Newtown is now at its best, crisp and juicy. It would be a great convenience to city buyers who have no place to keep a barrel of apples, if good fruit could be had in half-barrels or other small packages, but the retail grocer would rather buy in barrel lots and sell to his customers by the peck or half-peck at a big profit, and the trouble seems to be that dealers in the markets put a prohibitive price on the small packages. A bushel box of apples was offered to me recently for $3, nearly as much as a barrel could be bought for. No extensive trade in apples in boxes or kegs can be worked up without the coöperation of the retail grocer, and he is not going to coöperate in anything that will cut off his profits.

HEAVY DRAFT ON CHARITY.—A big strapping young fellow, with a pitiful put-on whine, recently asked me to buy him something to eat. As he appeared healthy, and fully able to do a day's work, I concluded not to interfere with hunger in its worthy effort to remind him that he who will not work shall not eat, the case being, so far as could be seen, one of pure laziness. Anyone with plenty of bone and muscle can earn enough money in this city so that he need not suffer from hunger. A person who would refuse to divide up with a cripple or helpless or unfortunate one in real distress, is lacking in that quality of human sympathy which would give him any right to expect mercy from others; but it is no kindness to give a healthy lazy man either money or food. Some would never work unless they felt the gnawing of hunger or the need of a new coat, and until they reform, such persons are of but little use to a community. It is sometimes hard to tell just who should have help, and probably better to err on the side of generosity by helping now and then an imposter, but in cases of glaring fraud a positive good may be done to the beggar by refusing him.

BOOM IN TIN HORNS.—It is not everyone who is honored by having a tin wedding on his first birthday, but this is what New York did for the new century. On New Year's Eve there were dozens of peddlers with bags, baskets and armfuls of tin horns, and they sold like hot cakes to the people who were on their way home from business, and wished to be prepared to celebrate in the orthodox way by cutting the midnight air up into bias pieces. For 10 cents a horn two feet long could be had, loaded with oceans of "come-to-dinner" music. The manufacturers had been thoughtful enough to make the horns with wooden nozzles, so that they could be operated without cutting the mouth on the tin. A crowd gathers around Trinity Church, where the chimes are rung a short time before midnight, and at the same time the horn blowers do their best to drown all other sounds. This time the special exercises in the City Hall Park drew the biggest crowd, and a brand of pandemonium was let loose there that discounted all previous efforts. There were times when probably 10,000 tin horns were in full blast at once. Men and women who ordinarily would not think of doing an undignified act on the street, blow their horns in each others ears, and in general act like a lot of wild school children. Of course, these things are all nonsense, but perhaps a little nonsense once a year is a good thing for people who are shut up in stores and offices most of the time; and this method of celebrating New Years is certainly a good thing for the tin horn people.

NOTES ON SUNDRY PRODUCTS.—The linseed-oil market is unsteady, with a downward tendency. Dealers are selling as low as 52 cents per gallon in Boston, and there are indications that a 50-cent rate may not be far off. All sales are small, as buyers are waiting until solid bottom is reached. Animal oils are very firm, and any improvement in the demand is likely to result in a rise in price. Prime neatsfoot brings 50 to 52 cents wholesale, and prime lard oil, 65 cents. Crude sperm oil brings 55 cents; the finest bleached Winter, 64, and bleached Winter whale, 48. . . . . Turpentine trade is dull, both here and at the South, 40 cents per gallon being the top figure named here, and 37 the highest for Wilmington and Savannah. Wholesale prices on tar and pitch are $2 and $1.75, respectively, per barrel, and coal tar in car lots sells for $4 per barrel. . . . . The trade in copper sulphate for use in treating Potato blight is reported to be greatly increasing in Ireland. Drug firms here are receiving numerous requests for quotations from dealers in that country. . . . . White lead ranges in price from 5¾ cents to 12, according to quality; prime white barytes, used largely as a substitute for white lead, $20 per ton, and pumice stone in lumps, five to six cents per pound. . . . . Business in domestic hides is reported quiet, and tanners are not showing any disposition to take large quantities. Top price for the finest native steers is 11¾ cents, and branded hides, 10 to 10¾ cents. Hemlock leather runs from 24 to 26 cents, and oak, 29 to 34, wholesale. Goatskins from Mexico and Brazil bring from 44 to 48 cents per pound. . . . . Rubber trade is quiet, and buyers, particularly shoe manufacturers, are not laying in heavy stocks. The open Winter thus far in many sections has put a damper on the shoe trade. The finest Para rubber brings 87 to 98 cents per pound. W. W. H.

THE GROUT BILL AT WASHINGTON.

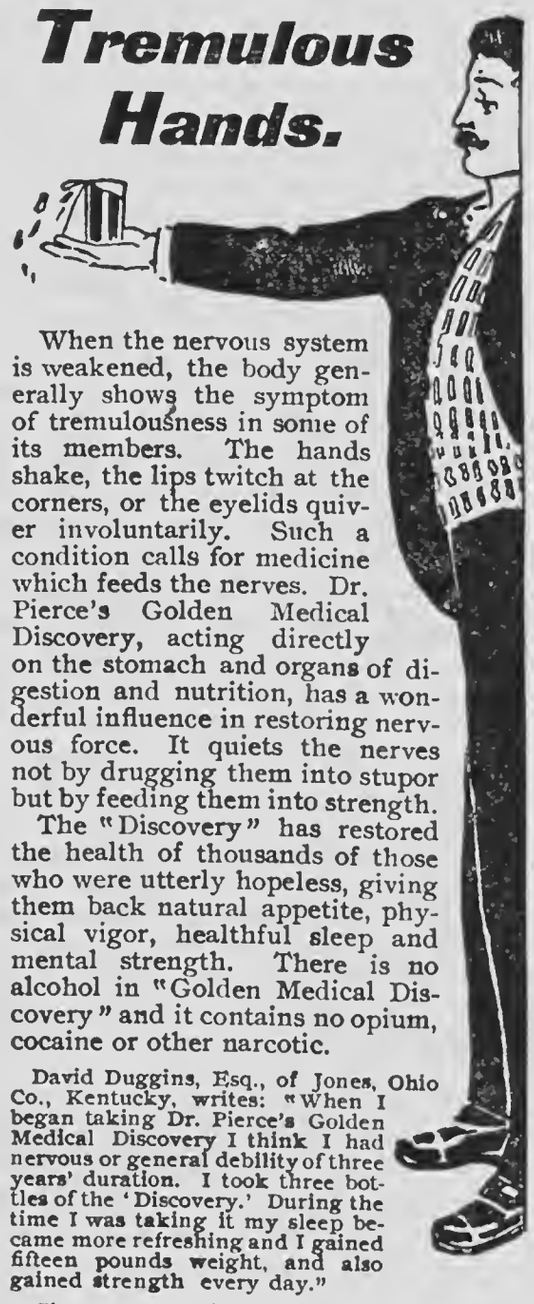
Arguments For and Against It.

The Committee on Agriculture and Forestry, of the United States Senate, has been listening to arguments for and against the Grout Oleomargarine bill for several weeks. It is seldom that a bill receives the attention from a committee of either House that has been bestowed on the oleo bill by this committee. Hearings have been almost continuous from day to day since the measure was put in the hands of this committee. Of course, it is not necessary that every member be present at each hearing, as the arguments are printed, and read before the final vote is taken to report the bill to the Senate. But the committee has listened with great patience to the various interests, and it would seem that everything that could be said on the subject had been heard before the hearings were closed on January 8. The purpose of the oleo interests has been to delay the hearings, and keep the bill in committee as long as possible in the hope of preventing a vote on it during this session of Congress. If they could accomplish this the whole work would have to be gone over again next year in the House, and in the meantime, oleo would be made in imitation of butter and sold as butter with the advantage of another year's profits in the pockets of the manufacturers. The committee cut short this little scheme by closing the hearings on January 10, and it is confidently hoped now that the bill will be reported to the Senate some time this month, and that it will be promptly considered by that body.

During the first week of January, George L. Flanders, of Albany; J. H. Kracke, of New York; J. Brown Richardson, of Lowville, and W. A. Rogers, of Watertown, appeared before the committee from New York State in support of the bill. Last week another delegation consisting of Mr. Kracke, Chas. H. Royce, of Rhinecliff, and John J. Dillon, of New York, appeared in support of the bill. The hearings were closed on Tuesday by arguments in favor of the bill by Chas. G. Knight, of Chicago; Dairy Commissioner H. C. Adams, of Wisconsin, and Secretary of Agriculture Wilson, of Washington, D. C. The oleo interests were represented mainly by paid attorneys of the manufacturers and cotton-seed oil interests From their arguments I am forced to the belief that they have made out a very poor case Their arguments were not only weak but inconsistent. Every man whom I heard on the oleo side contradicted himself over and over before he left the floor. Their main contentions are that the proposed law is unconstitutional, that they cannot sell oleo except when colored yellow, that the law is intended to kill their industry for the benefit of the dairymen, and that if this bill becomes a law dairymen and creamerymen will form a trust to advance the price of butter to the consumer. Some of their arguments would make a farmer smile at the blissful ignorance of the speakers. One contended that the farmers' wives made butter in their bedrooms; this same speaker, who claimed to represent labor unions, insisted that he ate oleo in preference to butter, and insisted that all laboring men wanted oleo when they could get it. He thought the only trouble was that farmers would not know what to do with their cows if the people were allowed the free use of oleo. Another claimed that workingmen in Pennsylvania towns asked for butter at the store and winked one eye when they wanted oleo. Another claimed that the butter was an imitation of oleo, and perhaps the most amusing of all was the serious way a Chicago oleo employer read a "black pepsin fraud" circular and offered it as an argument against the Grout bill. It was like a thief asking to have the laws against stealing annulled because a bunco man had attempted to sell a gold brick.

Those who appeared for honest butter simply contend that it is a fraud on the consuming public to mix up cheap fats and color them in order to sell them for butter. While butter is generally colored to preserve a uniform appearance, there is no deception; but on the other hand, oleo is colored in order that it may be sold for butter. Therein is the deception and the fraud. Those who spoke for honest butter called attention to the fact that ice cream is eaten and relished when in its natural light color, or when colored chocolate, pink, or strawberry. Why not adopt one of these colors for oleo? There is but one answer; it could not then be sold to a consumer who thought he was buying butter at butter prices. But the game is up. The Grout oleo bill will become a law. D.

Tremulous Hands.



When the nervous system is weakened, the body generally shows the symptom of tremulousness in some of its members. The hands shake, the lips twitch at the corners, or the eyelids quiver involuntarily. Such a condition calls for medicine which feeds the nerves. Dr. Pierce's Golden Medical Discovery, acting directly on the stomach and organs of digestion and nutrition, has a wonderful influence in restoring nervous force. It quiets the nerves not by drugging them into stupor but by feeding them into strength.

The "Discovery" has restored the health of thousands of those who were utterly hopeless, giving them back natural appetite, physical vigor, healthful sleep and mental strength. There is no alcohol in "Golden Medical Discovery" and it contains no opium, cocaine or other narcotic.

David Duggins, Esq., of Jones, Ohio Co., Kentucky, writes: "When I began taking Dr. Pierce's Golden Medical Discovery I think I had nervous or general debility of three years' duration. I took three bottles of the 'Discovery.' During the time I was taking it my sleep became more refreshing and I gained fifteen pounds weight, and also gained strength every day."

Free, on receipt of stamps to pay expense of mailing *only*, Dr. Pierce's Medical Adviser, 1008 pages. Send 21 one-cent stamps for book in paper covers, or 31 stamps in cloth binding to Dr. R. V. Pierce, Buffalo, N. Y.

RHEUMATISM.

The Dr. Von Post great Holland remedy, "QUICK RELIEF," in capsule form, QUICKLY CURES RHEUMATISM IN ITS WORST FORMS. No free doctors. No free samples. No free humbug, but an HONEST and special quick relieving remedy, as thousands will testify. Don't wait and suffer. The price is $1 per hundred, or send 25 cents in silver and get 25 capsules for trial and be convinced.

JOHN H. POST, Deep River, Conn.

Are You Deaf??

All cases of DEAFNESS or HARD-HEARING are now CURABLE by our new invention; only those born deaf are incurable. HEAD NOISES CEASE IMMEDIATELY. Describe your case. Examination and advice free. You can cure yourself at home at a nominal cost.

THE BREEDERS' WAYSIDE.

Silage and Abortion.

Is abortion contagious in a herd of cows? If so, what can I give to prevent it? Does feeding silage have anything to do with it?
Cayuga Co., N. Y. J. C. O.

I will answer the last part of the question first, by saying that silage will not cause abortion. There is no doubt about that. To be sure, abortion may occur in herds where silage is being fed, but that is only an incident. Contagious abortion is due to the occurrence of a disease germ prevailing in the stable. Only extreme cleanliness and special medical treatment will cause the disease to disappear. The stable should be thoroughly disinfected with crude carbolic acid or chloro-naptholeum, about the barn, and especially the stalls and manure trenches. The cows also need special treatment. They usually abort at five or seven months pregnancy. After an abortion the parts should be washed off and syringed out with a two-per-cent solution of chloro-naptholeum. This treatment, however, should be conducted under the direction of a competent veterinarian, which I am not, and it requires unceasing labor to get rid of this trouble. C. S. PLUMB.

Value of Corn Fodder.

Can you tell me the feeding value of a ton of dry corn fodder, stalks stripped of the leaves and husks? I have often heard that the bare stalk would be worth more alone than the leaves and husk. J. H. S.
Bernhart, Pa.

Chemists for many years have been studying the composition of the corn plant in its various parts and stages of development, so that now we can have a fair idea of what there is of value in the crop. Of course the real value of a food lies in its digestibility, and that is ascertained by studying the effects of the digestion of animals on the foods, or by means of artificial digestion experiments, in which pepsin is used in that connection in the laboratory. Several years ago Prof. Patterson, of the Maryland Station, made a study of the corn plant, in which he brought out the following facts: One acre of Indian corn yielded of digestible food, in the different parts of the plant, as follows: Ears: Dry substance, 1,530 pounds; protein, 157 pounds; carbohydrates, 1,343 pounds; fat, 30 pounds. Topped fodder: Dry substance, 450 pounds; protein, 10 pounds; carbohydrates, 422 pounds; fat, five pounds; ash, 13 pounds. Blades: Dry substance, 197 pounds; protein, six pounds; carbohydrates, 193 pounds; fat, four pounds; ash, 14 pounds. Husks: Dry substance, 426 pounds; protein, six pounds; carbohydrates, 414 pounds; fat, two pounds; ash, four pounds. Stubble: Dry substance, 569 pounds; protein, six pounds; carbohydrates, 545 pounds; fat, 13 pounds; ash, five pounds.

The dry substance referred to is that part of the plant digestible after absolutely all moisture has been removed. The protein, of course, is the most valuable portion, and the value of feeding stuffs is largely dependent on the amount of this present in them. In reporting on his work, Patterson states that the corn husks or shucks contain 72 per cent of digestible matter, the stubble or butts 66½ per cent, the blades or leaves 64.2 per cent and the stover (stalks) 55 per cent. There is more digestible matter in the corn fodder from one acre than in the ears from one acre. The stover from one acre yields as much digestible matter as do two tons of Timothy hay. At both the Pennsylvania and Georgia stations similar experiments were conducted, and conclusion arrived at much the same as at the Maryland Station. Out West, where corn is grown in enormous areas, the people are beginning to appreciate the great value of the stover. Each Fall and Winter great quantities are shredded and fed. For two Winters at the Indiana Station we have been keeping five horses on shredded fodder and grain in a small way, and feeding no hay. The horses have done more or less hard work, and thrived on the food, and we have been much pleased with it. Every bit of our 20 acres or so of corn fodder is shredded or cut up and fed out to horses, cattle and sheep. To be sure, there is some waste of the more pithy parts, but the stock relishes the feed greatly. Our people should feed more fodder, and they would gain thereby. Indian corn is the greatest farm crop grown in America. Corn is King!

C. S. PLUMB.

THE CONTENTED COW.

No, we do not pretend to say that the scene pictured on the first page is an ideal milking scene. Your expert breeder will prove without any trouble that the cow has not the true dairy shape, that her udder is too small, and that she cannot give a large yield of high-testing milk. Some good farmer will stand up and say that it's all a mistake to feed a cow while you are milking, and some professor of domestic science will say that the milking is not done in a sanitary manner. The young woman who is milking ought to have something over her head, and her dress is all wrong for the barnyard—besides, what is Grandmother doing out there when she might be at work indoors? In spite of all that these critics may say this picture illustrates one great foundation principle of successful milking. Everyone, including the cow, is comfortable and happy. The person who coined the phrase, "the milk of human kindness," must have been a dairyman, for the first principles of milk production are based on love and kindness. A contented cow is the milker for you. The cow in the picture may be a scrub so far as her breeding goes, but she is thoroughly happy and contented—willing to give down all the milk she can make up. The scientists and the sanitarians may improve her surroundings and ward off germs, but unless they copy the good nature and contentment which she now shows their labors will have been in vain.

A BOTTLE PIG.—One of our readers, Lovell Lea, of British Columbia, sends us the picture shown at Fig. 16. He says this is one of the ways they have of raising pigs in British Columbia. This little pig was hurt when it was only a few days old. Mr. Lea's sister said she would try to raise it on a baby's bottle. The pig soon learned to take its milk in this way, and is now as large as any of the others in that litter. We are glad to get this picture, because there has been a good deal of talk, first and last, about the chances of raising little pigs in this way. Dr. Jordan, of the New York Experiment Station, once invented a plan for feeding such pigs. He had a tin trough with a number of rubber tubes, and it is said that the little pigs learned to take their nourishment in this artificial manner. One thing is pretty sure, whenever there is a weak or ailing young animal on the place it pays to turn it over to the women folks for care, for they are far more likely to give it the attention that it needs than any of the masculine members of the family.

OLEO MORALS.—One of the best speeches on the oleo question was made by Congressman Cousins, of Iowa. Among other good things he said: "A hair in the butter used to be regarded as an awful thing, but now statesmen would defend it on constitutional grounds, holding that the ingredients of hair are harmless and that its trade between States should be unrestricted."

There has been considerable stock sold off here on account of short hay crop, but as far as I know by observation it has been mostly young stock and culls from the dairies. Most farmers have sold their surplus stock, keeping dairy cows, owing to high price of butter and cheese. I think it would be a hard matter to pick up a desirable lot of cows at $25 to $30. Most farmers have already disposed of stock enough so that they can winter what they have on hand. W. J. M.
East Randolph, N. Y.

EVOLUTION.—The following story of a famous restaurant in New York is told by a writer in Recreation: "The proprietor keeps several traps set on the roof of the building he occupies, and keeps the roof and the traps well baited with cracked wheat, or other food that English sparrows are fond of. Once or twice a day one of the waiters goes on the roof, takes the birds out of the traps, wrings their necks, and a few hours later they are served up to the gourmands as reedbirds at 50 cents each. The transformation from a street scavenger to a nicely browned reedbird is a form of evolution in bird life which Darwin probably never dreamed of."

COTTAGE CHEESE: A BY-PRODUCT.

In these days of cheap production it becomes necessary to make every by-product bring in its little revenue in order to make farming pay, and a farmer should be the greatest financier in the world. As we run a small dairy, and retail butter to customers in a city near by we have a hand separator and, of course, have a quantity of sweet skim-milk which, in past seasons, had been used to good advantage in feeding calves and young pigs. Last Summer, as we had no need of it for either, it became a question what to do with it until we hit upon a good article, in a dairy paper, telling how to make cottage cheese. We immediately began experimenting and in a short time succeeded in making a very good article.

The separated milk was set in tall cans, covered with a cloth, and left to sour. Just as soon as thick, for too long standing made bitter cheese, it was poured into a large milk pail, and this set into another vessel (ours was of galvanized iron, a 1½ bushel basket) containing water, and heated upon the stove, or oil stove, whichever was handiest. The milk was tested with a thermometer during its cooking, and only allowed to reach 110 degrees. It was stirred frequently to keep the heat even throughout the entire mass, also to break up the curd. If allowed to stand at 110 degrees very long the product was hard and dry, and no amount of working would make it a good article. When the cooking was done the mass was emptied into a cheesecloth bag to drain, the whey being saved and mixed with grain for pig feed. The bag was then hung up to drain over night. Next morning the cheese was taken from the bag and put upon the butter-worker. If well drained it contained many lumps, and the grains were of various sizes and very dry. After working—how much depended upon the amount of moisture left in from the draining—the cheese was transferred to a large butter bowl, weighed and salted, one-third of an ounce to one pound of cheese. Then with the hands it was manipulated much as is done with bread—until the salt was well mixed throughout. If not moist enough, cream was added until it was of a consistency which made it easily molded. The cream gave it also a faint yellow color; the color, however, was sometimes made for it by the addition of a small quantity of cheese color placed in the skim-milk when set to sour.

The last process was the forming into prints. This was done by means of a butter print in the pound size; the packing of print being done with a tablespoon. When molded, the cakes were done up in parchment papers, appropriately labeled with "Fancy Cottage Cheese" and the name of farm and proprietor. These pound prints found a ready sale among our various butter customers at 10 cents per pound, and we also gave them to a vegetable peddler to handle, in the same city. He found no trouble in disposing of them to his customers. The buttermilk also found a ready sale in like manner at 10 and 12 cents per gallon. Of course, to many this would not be very practical on account of the various tools we used in its manufacture, but as we already had them in connection with our dairy business it worked in very nicely. The trade in cheese only lasted during the Summer months and then was best during the earlier ones. In the warmer part of the Summer the souring of the milk had to be watched more carefully and less cream, if any, be used in the manufacture of the cheese, in order to make its keeping qualities good. In cool weather it would keep for three or four days, but in warm weather, unless kept on ice, fermentation would begin very quickly, and the cheese spoil in a day.

MRS. G. L. ROSS.

Lake Geneva, Wis.

A TALK ABOUT ROUP.

The fact that roup as an epidemic rarely if ever attacks the farmer's flock is significant and instructive. It belongs largely to the class of diseases which artificial conditions of the fowl have developed and stimulated. It is not inherited, and is not likely to appear in a sturdy, healthy bird. Anything in housing, feed or care that tends toward lowering vitality acts as a ready factor, where the constitution of the bird is ripe for or open to the assault. At the Rhode Island Experiment Station they recently yarded six late-hatched pullets and four vigorous, healthy hens with an extreme and a typical case of roup. The fowls fed, ate and slept together, also every morning had their eyes anointed with the exudation from the sick bird's eyes. The experiment extended over two months, during which time two of the pullets died (one of them sickening only at the end of four weeks). The other two showed slight symptoms of the disease about the eyes, but gradually recovered. None of the hens sickened. The first pullet that succumbed to roup was in a weak, debilitated condition. The experiment is important to us, mainly in proving the value of the rule of prevention over that of remedy.

Being embarked in poultry raising, and not contemplating shipwreck, it is well to realize that an epidemic means heavy loss and endless expense in time and labor, ending in very unsatisfactory results, and therefore to use every precautionary method to prevent disease from attacking the fowls. Along this line one finds use for quite a little common (or as some claim uncommon) sense, and put yourself in their place. Provided the stock is all right, they will stand quite severe cold in housing if given plenty of hearty food and exercise; beef scraps, corn, grain ,vegetables, good water and grit. But a current of air, a steady draft, on a roosting bird, is fatal in its results.

A case of roup, in its incipient stages, will be very much benefited by a warm dust bath such as recently described in THE R. N.-Y., in which is a good proportion of slaked lime. The hens exercise and kick the air full of lime, which is inhaled, and they cough out the mucus. Somehow it helps them quite a little, and also a few drops of tincture of iron in the drinking water assists in throwing off the disease. Where roup is well under way and has developed into an epidemic, the best authorities appear united in advice to kill and burn the sufferers, thoroughly disinfect and cleanse the premises, including buildings and furniture, and to give the fowls left a nourishing diet with exercise and a tonic. In the case under discussion, it is difficult to tell which is most injurious in its results—drafty housing, improper feeding or filth. Certainly the stress laid on the cleansing of infected quarters shows uncleanliness to hold no mean position of importance. The constitutions of birds that have had the roup are usually so weakened as to unfit them for breeding purposes; so it does not ordinarily pay to doctor them back to convalescence. Their eggs should neither be sold nor used for hatching. Given good health from the start—if well fed, not crowded, having plenty of sunshine and fresh air, fowls will not easily contract disease, and if roup ever gains headway in a poultry yard, the owner has only himself to thank for the discouraging outlook before him.

Chazy, N. Y. F. E. W.

WHY I KEEP LEGHORNS.—There are several reasons. I formerly thought raising meat and eggs should go together, and I found some profit in it, but as I increased my flocks the nuisance of broody hens became unbearable. I do not wish it understood that my Leghorns never want to sit, for many of them do, but they are easily cured, and they lay much better during the Summer and Fall than any others I have tried. They can be kept cheaper than large fowls, as they can be fed more corn, and corn is the cheapest feed to be had at this place. Large fowls, after they are one or two years old, become over fat, unless great care is exercised, while Leghorns seldom do, and can be kept much longer. They do not require so much house room. A house large enough for 40 Leghorns is none too large for 30 P. Rocks or Brahmas, and at the end of the year my cash account is decidedly in favor of Leghorns.

SHARPLES Cream Separators.

Don't think if you buy a farm separator you must buy something complicated and hard to manage.

Don't think that because one kind of farm separator requires an hour to wash it that all do.

Don't think that constant repair bills are a necessity just because some one with a complicated separator has to pay them.

Don't think that some other farm separator is as good as the Sharple because some agent for the other condemns the Sharples. He fears its superiority, is the reason he condemns it. Send for free Catalogue No. 25

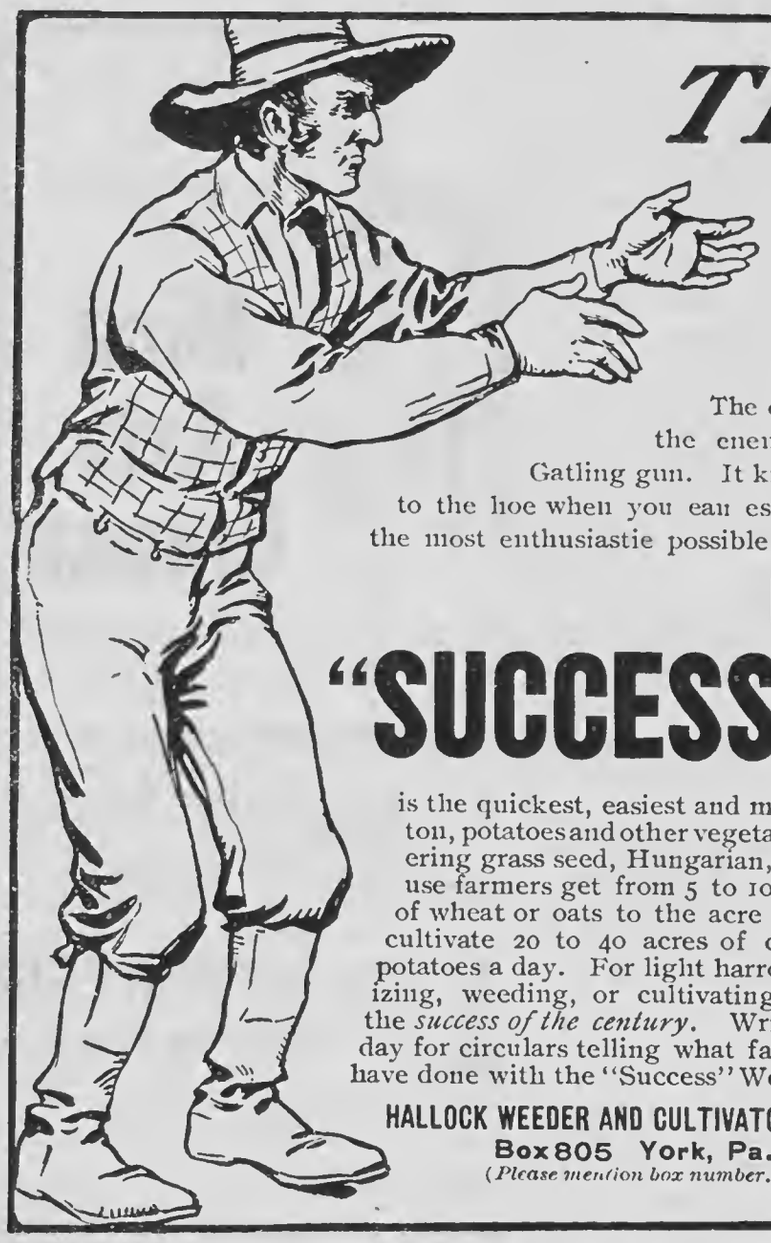
How to Drain Land Profitably.

On every farm there is probably some land that could be made more productive by underdrainage. Properly drained land can always be worked earlier, and more profitably. The best and most economical way to drain is explained in the book, "Benefits of Drainage and How to Drain," which is sent *free* by

ROUND TILE

JOHN H. JACKSON, Third Ave., Albany, N. Y.

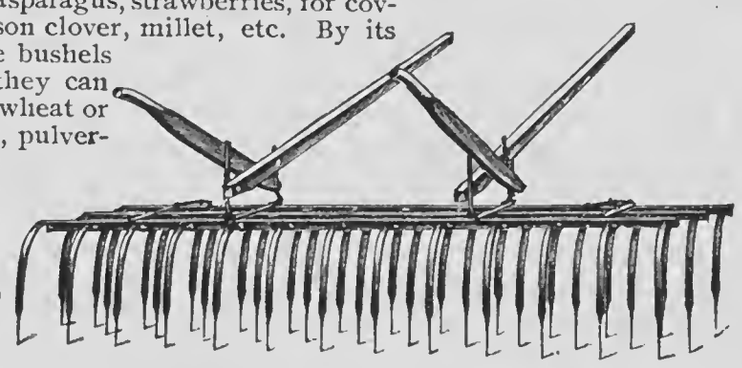


Throw away The Old Hoe

The old hoe for fighting weeds was like an old-time musket, it killed the enemy one by one. The Halloek "Suecess" Weeder is like a Gatling gun. It knocks them over by the million. Can you afford to be a slave to the hoe when you eaii escape so easily? Halloek's is the only perfect weeder. It has the most enthusiastic possible endorsement from the 50,000 farmers who now use it.

HALLOCK'S "SUCCESS" Anti-Clog WEEDER and Cultivator

is the quickest, easiest and most thorough implement for working eorn, wheat, oats, rye, eotton, potatoes and other vegetables, asparagus, strawberries, for covering grass seed, Hungarian, crimson clover, millet, etc. By its use farmers get from 5 to 10 more bushels of wheat or oats to the acre and they can cultivate 20 to 40 acres of corn, wheat or potatoes a day. For light harrowing, pulverizing, weeding, or cultivating it is the *success of the century*. Write today for circulars telling what farmers have done with the "Success" Weeder.



HALLOCK WEEDER AND CULTIVATOR CO.,
Box 805 York, Pa.
(Please mention box number.)

TRANSPLANTERS

We make them for transplanting plants, such as Cabbage, Tobacco, Sweet Potatoes, Celery, Sugar Beets, Turnips, Tomatoes, Strawberries; also used on Sprouts and in planting Potatoes. Absolutely guaranteed to do the work. Capacity 4 to 6 acres per day. Lightest, cheapest and easiest operated machine made.

THE RURAL NEW-YORKER

A JOURNAL FOR THE SUBURBAN AND COUNTRY HOME

VOL. LX. No. 2661. NEW YORK, JANUARY 26, 1901. $1 PER YEAR.

A WESTERN HOG RAISER'S METHODS.

CORN, WATER, AIR AND PASTURE.

The Fine Art of Pork Making.

CORN AND WATER.—The average western hog-raiser is dreadfully "unscientific" in his methods, but he raises hogs, and lots of them, and usually makes plenty of money by the operation. The writer was reared on a farm, in a "hog district," in the great Middle West, where hogs are raised on corn, just plain corn and water (and, as the Editor suggests, plenty of fresh air), and nothing more, and never dreamed that they were ever raised in any other way, nor that there was other normal food for swine than corn. Once upon a time when visiting a farmer in southeastern New York, I was requested, in the absence of the farmer, to feed the "pig"—a 400-pound swill barrel, in a hog skin, on a board floor, in a little 4x8 sty. After searching long for the corn crib, I found a few well-preserved ears, which were fed to piggy, but this bloated eastern aristocrat positively refused to eat them! On the return of the farmer, great light was shed on the subject of pork-raising as practiced in the East and the West, and on the preservation of *seed corn!* That was 15 years ago, but the wonder expressed by those people is not yet dim in my recollection, and thinking that others might wish to know of the western method, it is here outlined.

A HOG FORCER.—Sidney Terwilliger, whose farm is within five miles of Madison, and within 1½ mile of a railroad station, is a fair example of the Wisconsin hog-raiser. Mr. Terwilliger tried "cow-punching" on the plains in the early days of the ranching industry, when the men who pursued this calling were liable at any moment to be themselves pursued by hostile Indians, intent on scalp-lifting. He now occupies a handsome modern residence in one of the prettiest suburbs of Madison, within easy reach of his 300-acre farm. I called on him recently for the purpose of getting facts in regard to present-day methods. He had but just returned from Chicago, where he had gone with a carload of hogs, and as the markets had been favorable for some time, the answers to my questions were naturally somewhat optimistic.

"How many hogs do you sell in a year?"

"From 175 to 225. I shall have about 220 this year."

"At what age do you aim to have the pigs ready for market?"

"From nine to 10 months. If properly handled, there is more money in a pig at nine months than at any later time. Mine will average 250 pounds at this age. I aim to have them ready in December or January. I am breeding later and later every year, and next year will have no pigs before May 1, as they start off better at this season, and with less trouble than earlier."

"What breed do you consider best for this 'forcing method'?"

"The Poland China; I have tried Chester White and Jersey Red, and crosses of each on Poland China, but I am breeding back to pure Poland China now. The Chesters are not prolific enough to be profitable, and the Jerseys are too heavy-framed, and require too long a time to mature; they are too slow in laying on fat."

"How many brood sows do you keep, and how are they fed?"

"I have selected 40 sows this year from the drove. These are fed but little corn now, but have the run of the steer-feeding yards instead. I figure on five pigs apiece. Sometimes as many as 16 are born, but five or six is the average raised. The sows, of course, have separate pens with board floors. Ground feed (corn and oats) and whole corn is the diet. The milk from 20 cows is fed, but this amounts to little. When the pigs are eight or nine weeks old, runways are opened, and the pigs are given all of the milk, but this amount, as you can imagine, furnishes little more than a good-sized smell for each one; but this, with good pasture, is all they get until new corn comes in."

"Don't you feed shorts?"

"None at all. I have not fed five tons of shorts in all the time I have raised hogs, 25 years. Corn and water is the diet, with plenty of grass."

NOTHING LIKE CORN.—This is the secret of it. Western farmers are accustomed to say that their pork is produced on corn and water alone, but forget the grass. Good pasturage all the Summer is the rule, with a liberal allowance of old corn. Late in August, or as soon as the growing corn has fairly well formed ears, "snapping" is begun. The ears are grasped near the end, and by a sharp, downward motion are easily broken from the stalk. The hogs do the husking, and do it well; if not overfed the softer husks and the cobs will often be eaten also. Acres of corn are fed by this method, and the stalks left standing, to be picked over later by cattle. Mr. Terwilliger, however, no longer "snaps" corn, but fences off a portion of the cornfield and turns in the drove. By this plan the labor of gathering the ears is saved. Later, as the stalks ripen and the husks open, corn is husked and fed direct from the field.

A "RAZORBACK" AND HER FAMILY. FIG. 19.

One of the typical and interesting sights of a western hog farm is the feeding. A two-horse load of corn, which means from 30 to 40 bushels of ears, is hauled direct from the field to the pasture or yards, into the midst of 200 or 300 squealing porkers. Until the teamster can secure his team and start shoveling, the din is something terrific. The scoop-shovel is soon set in motion and the great yellow ears are scattered over the field, and all is quiet except for the crunching and grinding of the kernels in 200 hungry mouths. Where the drove is as large as Mr. Terwilliger's, one man is kept fairly busy husking and feeding. No stated hours nor any given amount of corn is proscribed. As much is fed as will be eaten, and it is astonishing to see the quantity that will be consumed. There is no variety. Corn for breakfast; corn for dinner, corn for supper and corn at the numerous lunch hours. Only corn and nothing more—except grass and water, and as the season advances, grass is no longer available. At the close of the fattening period the porkers, when not eating, lie sleeping in the Autumn sunshine, turning corn fat into hog fat. Mr. Terwilliger, in common with other large producers, prefers to hire a car or cars, and ship his hogs, rather than sell to traveling buyers. From 60 to 70 250-pound hogs is the capacity of an ordinary stock car. Freight and stockyard charges are thus paid by the owner, but the gain in price over that offered by the buyer, is usually sufficient to insure a handsome profit when this system is followed.

THE DARK SIDE.—This is the bright side of the hog-feeder's picture, and it might be inferred from this that a fortune may be easily and quickly made producing pork for the Chicago market. It sounded easy as Mr. Terwilliger told it, and had I not known him for a lifetime I might have been induced to buy a farm and attempt to do likewise. Fifty-five thousand pounds of pork! Also 12,000 pounds of beef, besides several hundred pounds of butter and a few young horses to sell every year! Thousands of western farmers do as well, while thousands of others fail. It is the *man* and not the crops after all. I have not mentioned the hog cholera, the dreaded scourge of every farmer in the Northwest. Anxiously the drove is watched, and if a wheezy cough is heard or a porker refuses his feed, cold chills run down the owner's back, for he well knows what to expect, viz., instead of several thousand pounds of pork at $5 per 100, he will have in a few weeks a fine lot of fertilizer worth $5 per ton. In three townships of Dane Co., Wis., the loss has been estimated at $50,000 last Fall. When wheat raising failed in Wisconsin Mr. Terwilliger, in common with many others, possessed the foresight to go into this line of farming, and 25 years of careful study of breeds and methods have brought success. As the present generation of western farmers have shifted from wheat to corn and pork, so the next generation will without doubt shift largely to butter and cheese. The dairy cow is bound to divide honors in the future with the hog, but they will work well togetner.

FREDERIC CRANEFIELD.

Wisconsin Exp. Station.

R. N.-Y.—There is one very sure thing about the hog business. If Mr. Terwilliger undertook to feed and breed such objects as the one pictured on this page, Fig. 19, he would have a different story to tell. His corn would simply vanish into thin air, blown through the hog's throat in the form of squeals. The animal is a true "razorback" from the South. She can outrun a deer and eat more than an elephant. She was carried about from one fair to another to advertise a wire fence, and taught facts regarding livestock keeping. Here is one result of "natural selection." Inbreeding has reduced her vitality and given prominence to the parts of her carcass—such as nose and legs—which are of least service to man. She has also been left to select her food "naturally," and that means little of it when most needed. Yes, indeed, it is a long step from the stringy "razorback" to the meat-making Poland China, but there is hope for the grandchildren of this old sow! Could not she and her descendants be improved by feeding alone? Yes, to a great extent, but it would require long years to accomplish the desired results. The introduction of improved blood would be a surer and quicker method because this improved blood would bring with it inherited tendencies to produce better shape, larger size and ability to turn food into meat instead of motion.

RETAIL BUSINESS ON THE FARM.

Printers' Ink for Middleman.

Some of our western readers who are located on large farms, and do a wholesale business in grain and meat or wool, are apt to think that the little eastern farms, located in thickly-settled districts, are mere toys. They would be astonished if they could know how much some of these little farms produce. We have recently learned something about the methods employed in selling the products of Unkeway Farm, which is located at Babylon, Long Island. This place is on the south side of the Island—the Summer home of many wealthy people, and a vacation ground for many more. F. R. Townsend, the proprietor of Unkeway Farm, is a former business man, and instead of selling to peddlers and grocers he goes direct to the consumers. He has a printed list of the 51 articles produced on the farm. These lists are mailed to customers with the prices of articles marked in ink. For example, here is the list as it was sent early in December:

We quote prices to-day as follows:

Eggs, per doz	35
Chickens, roasting, lb	16
" fowls, per lb	14
" broilers, pair	1.25
Ducks, per lb	—
Asparagus, bunch	—
Artichokes, each	—
Beans, string, per qt	—
" lima, per qt	—
Beets, per qt	5
Brussels sprouts, per qt	7
Cabbage, each	8
Cauliflower	10 to 25
Celery, head	4
Corn, per doz	—
Cucumbers, each	—
Egg plant each	—
Kohlrabi, bunch	—
Leeks, bunch	5

Articles not marked are not on hand.

Lettuce, hothouse, head	8
Mushrooms, ¾lb. per qt	40
Okra, per qt	—
Onions, per qt	10
Parsley, bunch	5
Parsnips, each	2
Peas, per qt	—
Peppers, each	—
Potatoes, per peck	20
Pumpkins, each	—
Radishes, hothouse, bch	5
Rhubarb, bunch	—
Spinach, per peck	20
Soup vegetables, bunch	5
Squash, each	—
Sweet potatoes, per qt	5
Tomatoes, per qt	—
Turnips, per qt	5
Carrots, per qt	5

Fruit in Season.

Apples, per peck	25
Plums, per peck	—
Pears, per peck	—
Currants, per peck	—
Raspberries, per peck	—
Blackberries, per peck	—
Gooseberries, per peck	—
Peaches, basket	—
Grapes, per lb	—
Melons, musk, each	—
" water, each	—
Young roasting pigs, ea	3.50
Sausage meat, per lb	18

"How often are these statements sent out?" we asked.

"We send the marked quotation list every 10 days, and postal cards are included, printed with blanks in such a way that it is easy for customers to make their orders."

"Of course you aim to sell only first-class products?"

"We work hard to produce the very best article possible, and on no condition will we fill the order unless the articles are as good as the market affords. You will see that we offer 51 different articles from our farm, and we often have much difficulty in providing really first-class goods enough for our trade."

"Who do these circulars go to?"

"We send them to all prominent residents of our town, and to all those hiring or taking Summer cottages, of which there are many along the shore. We also send them to our friends and acquaintances in New York, and are constantly on the lookout for new customers."

"How and when do you deliver?"

"In our town goods are delivered at once if wanted. If not, they go out with our first delivery. Some of our customers give us orders for certain quantities every other day, or twice a week. Others change but little, and as soon as we learn the requirements of a family, we are safe in taking the goods to the door even without a positive order."

"How about goods for the city?"

"Friday is our shipping day, and with few exceptions our customers are willing to accommodate us. All our articles are packed carefully in hampers which are made especially for us. The express company returns the hampers free of charge."

"How large are these orders?"

"Here is a copy of one just delivered which will show about the character of the goods ordered:

BABYLON, L. I., DEC. 7, 1900.

Mrs. Blank.

TO UNKEWAY FARM

F. R. TOWNSEND.

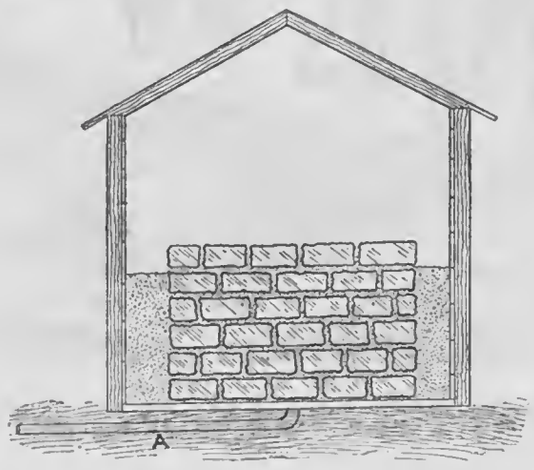
4 Dozen eggs @ 35c	$1.40
2 Chickens, 8½ lbs. @ 16c	1.32
2 Quarts of beets @ 5c	.10
1 Cabbage	8
4 Lettuce @ 6c	.24
6 Celery @ 4c	.24
1 Quart onions	.10
2 Parsley @ 5c	.10
4 Parsnips @ 1c	4
1 Peck potatoes	.20
6 Bunches radishes @ 5c	.30
1 Peck spinach	.20
1 Quart white turnips	5
1 Quart carrots	5
1 Soup vegetables	5
4 Quarts sweet potatoes	.20
2 Pounds sausage meat @ 18	.36
Total	$5.63

"How large is your farm?"

"We have under intensive culture about 13 acres, and about two acres devoted to the chicken department, about 2,000 square feet of glass and over 50 cold frames."

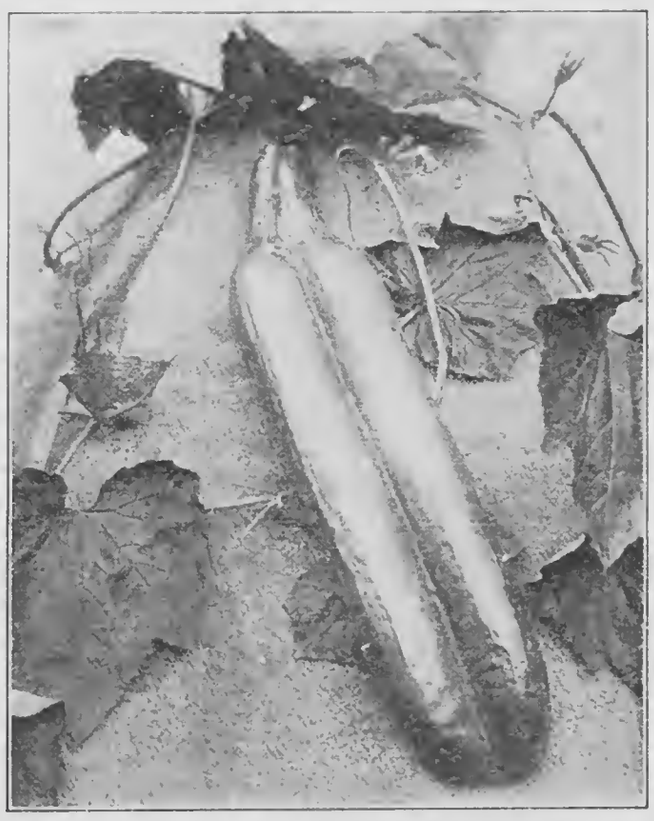
"What is the most profitable department of your business?"

"The fruit and plant department. We raised last year about 40,000 vegetable plants. We used many ourselves, and the remainder we sold. We could have sold many more. We also raise quite a good many



PROPERLY-PACKED ICE. Fig. 20.

flowering plants, palms, roses, etc. The following list will show what we now have growing: Twelve varieties of geraniums; one rose; four varieties of Fuchsia; eight Chrysanthemums, including Marguerite; 12 hardy roses; 12 tender roses; one Gesnera; one Yucca; three Hibiscus; one Croton; six ferns; two Dracænas; three carnations; eight palms, all our own seedlings, including Latania, Phœnix, Kentia and Cocos; two Agaves; two Aspidistra; 10,000 strawberry plants, including Sharpless, Gandy, Glen Mary, Beder



A TWIN CUCUMBER. Fig. 21.

Wood and Brandywine; 300 blackberries; 600 raspberries; 175 currants; 175 gooseberries.

"Do you supply flowers for family trade?"

"We supply many farmers' wives with small plants for their window boxes. For instance, we can supply the following list in two-inch pots for 25 cents, or four-inch pots for 50 cents: One geranium, one ice plant, one wandering Jew, one rose geranium, and one small palm. This would be the smallest order, and, of course, we handle them in much larger lots

A DOUBLE-BARRELED SILO IN NEW JERSEY. Fig. 22.

when desired. This is a good business, especially in a neighborhood like ours. We give a little instruction to those who buy these plants, especially with regard to watering and ordinary care. The farm is run in a strict business way, with accounts open with six different departments, with a regular set of books, so that we know just what each department brings in and also what it costs."

My experience in seeding Timothy is to plow the land in the Fall and seed Timothy alone. I have cut the next July two tons per acre. I sow about four quarts of seed per acre. M. L. S.

FILLING THE ICE HOUSE.

The sketch, Fig. 20, shows a cross section of our own ice house, with boards nailed horizontally on the inside of the poles. From 12 to 15 inches should be left between the ice cakes and the walls. Locate the ice house where good natural drainage may be secured. Tile may be laid, as indicated at A, to secure more adequate drainage if needed. Cut the cakes so as to break joints, say 18x36 inches, or 15x30, as conditions may require. It will be impossible to make the cakes fit together perfectly, no matter how expert the saw manipulator may be. On this account, we put in one layer, fit closely as possible, then shave over the upper surface of all the cakes with a carpenter's adze. The shavings of ice are swept into the crevices between cakes. When freezing cold, a little water is sprinkled over the whole surface to cement the layer solidly together.

As each layer is completed, the sawdust should be filled in around the sides, level with the top, and solidly tamped down. Allow no sawdust to remain on top of the various layers until the ice house is filled. Fig. 20 shows the sixth layer in and ready for the sawdust. Ice is preserved by being packed away from the air. As hot weather comes on the ice will settle some. Be sure to keep the sawdust tamped down around the sides frequently during early Summer, and see that no airholes form. When the ice is all packed in, cover with 10 to 15 inches of sawdust. Leave the gables open more or less to allow free circulation of air over the ice. I hope that this description, with sketches, of our own successful harvesting and storing of ice in a cheap pole-frame ice house, will encourage many farmers, who read The R. N.-Y., to decide to have some ice next season. And may they thoroughly enjoy, for the first time, the cooling benefits which accrue to the fortunate possessors of the congealed fluid. Next Summer write us how you like it.

J. H. BROWN.

A TWIN CUCUMBER.

Fig. 21 is a very good representation of a twin cucumber grown in England and reported to us by Mr. Charles J. Fox, Ontario, Canada. Abortive twin fruits are not uncommon, but it is seldom that one arrives at any symmetrical maturity, as the chances are all against the equal pollination and development of twin or multiple ovaries. As every cell in a growing plant is theoretically capable of indefinite segmentation or sub-division, there would seem to be ample opportunity to develop these monstrosities, but Nature generally confines her efforts to the perpetuation of the species in the most simple and direct manner, and twin fruits usually either fail entirely or develop in a lopsided manner. The cucumber represented is evidently one of the glasshouse or forcing varieties, which have been so educated by culture under highly-artificial conditions that the fruits, which are only enlarged and highly developed ovaries, are grown to maturity without the stimulus of pollen from the male flowers, and, in consequence, without the production of seeds. For this reason this class of cucumbers is more likely to develop a symmetrical twin fruit than most other plants, but it is rare to find so perfect a specimen. Mr. Fox omitted to say whether perfect seeds were found in this specimen or not. In case seeds were developed the subject of illustration is even more extraordinary, as an almost equal number must have been found in each of the twin fruits.

A LIFE-TIME SILO.—Noticing Mr. Cook's recent article on solid and substantial silos I am moved to send you a little sketch of twin silos recently put up by a large dairy company in New Jersey, shown in Fig. 22. These silos are of large capacity, being 22 feet in diameter and 30 feet high inside, and made of brick and stone throughout. The plan is that given by Prof. King in the Wisconsin bulletin on silos, with one notable exception. The doorway has no wooden frame, as given in the bulletin, but the door is clamped to the inside of the opening by strong rods, which pass to a timber across the outside. There is thus no woodwork to decay that cannot be easily replaced. These silos cost about $800 each, and are calculated to last a life time. C. O. U.

Plainsboro, N. J.

Crude petroleum is being used as a first coat or "priming" on weatherbeaten buildings. It is a wood preservative and makes good underclothing for a coat of paint.

In regard to hay press will say that I made one for hand power; two men can bale three tons in 10 hours; size of bale 48 x36x23 inches; weight from 125 to 180 pounds. M. L. S.

Cows have been pretty well picked up in this section, Chemung County, at prices ranging from $10 to $25 on an average. No doubt there are some throughout the county left, which could be bought at the prices mentioned, but no large amount, and I do not think they would be of extra quality. B. N.

Horseheads, N. Y.

ESSENTIALS OF STRAWBERRY CULTURE.

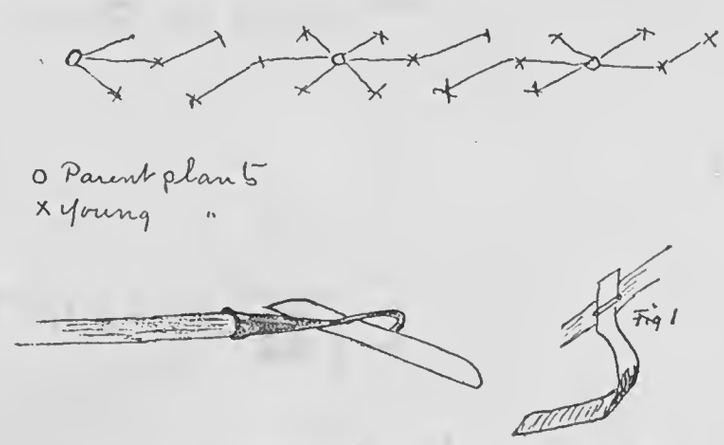
How It Is Done in Oswego Co., N. Y.

THE SOIL AND ITS CARE.—The soil in which the strawberry attains its greatest perfection in this section seems to be a deep, rich, clay sand loam mixed with small stones, originally wet but underdrained. Our soil contains large quantities of potash, chiefly in the form of silicate of potash, which we are told by the chemist gives up its properties very slowly; hence our soil is strong and lasting. On account of late Spring frosts the best results have been attained on hilltops and north and east slopes. Low lands are as a rule avoided, both on account of frost and character of soil, which being mucky or heavy clay is not congenial to strawberries. Fertilization is best done by preparing the land a year or two in advance by thorough tillage and the addition of something to make humus; if nothing better is at hand plenty of straw. For slow-starting varieties, a light application of nitrate of soda is of value, but great care must be taken in applying it, as it is very caustic. The fitting of the land is of the very highest importance. Nothing should be spared here, as upon this preparation the success or failure of the future crop depends. In short, it should be as finely fitted as an onion bed, and furrowed. The Meeker harrow is the best tool known for the purpose. Marking is done by a hand-marker made of a tough board of bass-wood, spruce, etc., 10 to 12 inches wide, ⅜-inch thick, about 12 feet long, fitted with a light pair of thills and little runners on the bottom of board at desired distances to mark the rows. A line is stretched along one side and one end of the field, and a guide-mark made. The marker is then drawn carefully across the field both ways, thus throwing it into squares. The utmost care is needed here to keep the rows straight and of uniform distance apart. This care is amply repaid during the season both in appearance of field and ease of culture. The distances vary from 2½ to three feet, according to varieties, individual taste and other conditions.

PLANTS AND SETTING.—The plants, which have been grown in beds separately for that purpose, and not taken up between the rows, as is the custom with some, are carefully lifted with the spading fork, earth shaken out, roots straightened, runners and old leaves pulled opposite way, and while yet in bunches in the hand the roots are shortened back to about four inches, and tops sheared back as closely to the hearts as can be done safely. This is a much shorter way than the old one of trimming each plant separately. The roots are then dipped in water and the plants placed in tight boxes; shoe boxes are good. *Never expose a plant to the air a single second longer than is absolutely necessary.* More plants are lost or seriously weakened in this way than any other way of which we know. The quicker the plants are dug and replanted the better the chances of success. For setting we use long-handled spades. The man carries on his back a market basket with a board cover and a wet cloth inside, in which the plants are put. He thrusts his spade deeply into the ground at the cross-mark, pushes the handle well forward, while the dropper boy, who has taken a small handful of plants from the basket, places one or two plants in the hole thus made. The spade man then removes the spade and steps close to the plant, thus securely firming it. Care should be taken that the roots are well spread out in a fan shape, and when planted they should be as deep as before digging, but no deeper. A dust mulch should be made at once about newly-set plants. This is very important.

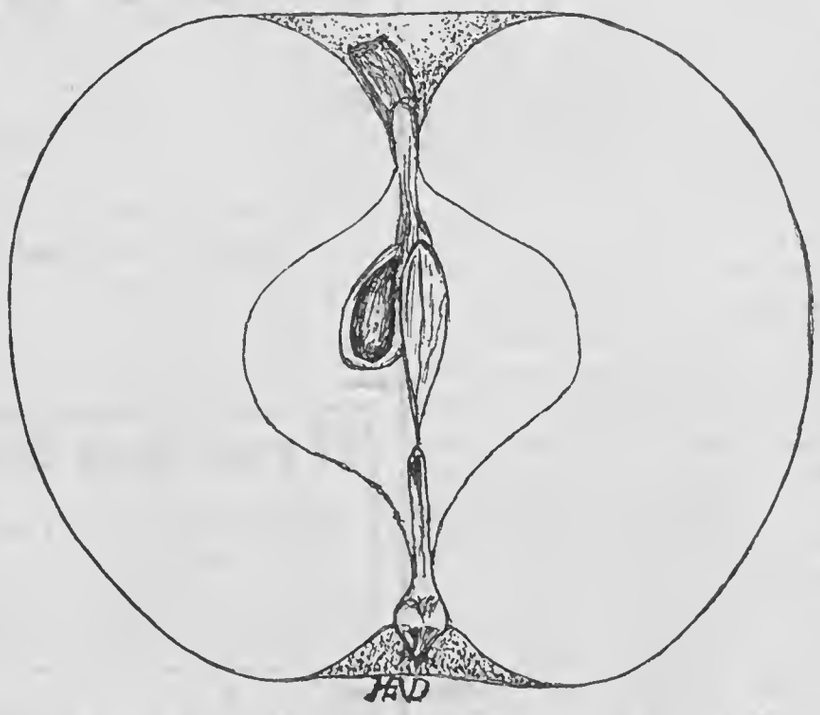
CULTIVATION AND TRAINING.—After-cultivation consists in keeping the soil well stirred to a depth of one or two inches but not deeper, and all weeds removed. A 14-tooth cultivator is a very fine tool if provided with three or four flat-cutting hoes like those shown in Fig. 23. These are made for us out of old wagon springs. They cut all thistles, dock and other weeds which may be left by the narrow teeth. Our experience has been that a strawberry plant should be as near 12 months old at the time of fruiting as possible. To attain this result, the runners must start early; consequently we set very early and encourage the plants to throw out runners at the very earliest possible moment. The largest, best and most fruit is always found on these early plants. The later plants are weak, short-rooted, and in many varieties partially or wholly barren, particularly those of the Marshall or Gandy type. The old rule was to cut off the first runners; this is now reversed, we cut off the later ones. We cultivate both ways frequently until the runners start freely, when we train lengthwise in the direction the rows are to be, placing the runners as shown at Fig. 23; those in front of the plant, as the bedder is working, to the left, those behind the plant to the right. This method prevents the plants from growing together in bunches and allows the extra plants to run out between the rows where they can be easily destroyed. Bedding is done by people on their knees astride of the row, using a homemade tool very like a wide putty knife. This bedding is, we think, the most important, though costly, part of the culture. Plants so treated are much larger and are far better rooted. We dare not omit it.

During the latter part of the season we use hoes like the one shown at Fig. 23, which are 12 inches wide and two inches broad. There is a beet hoe now made, which, though not quite so wide, will do nicely. This



BIG STRAWBERRIES; TOOLS AND CULTURE. FIG. 23.

hoe can be worked under the leaves and runners, doing better and quicker work than any tool we have. Autumn hoeing and weeding is very important, for if not done such weeds as chickweed, etc., may seriously injure the plants before Spring. If plants are found to be too thick, or rows too wide, we do not hesitate to thin out severely, as a strawberry plant too many is the very worst kind of a weed in a strawberry bed. Nature's time for mulching the strawberry is when the leaves from the trees have fallen and are blowing about. We can make little mistake



THE PARAGON APPLE—FROM LIFE. FIG. 24. SEE PAGE 54.

in following Nature. In covering with straw, which is our only covering here, great care should be taken that it is free from Timothy grass seed, which is one of the worst things to get into a bearing bed, as it is so fine it cannot be weeded in the Spring, and quickly forms a sod. We use from three to six tons of straw per acre, spreading it from a one-horse two-wheeled cart, with wheels from an old mower, the axle of which is five feet long. This cart runs on the outside of two rows, while the horse walks between them, thus doing no harm. In this article we have tried to touch upon a few of the more important parts of strawberry culture. In our experience of over 20 years, each year impresses us more firmly with the fact that strawberry culture consists, in common with all the other higher divisions of horticulture, of an intelligent and strict attention to a mass of what the ordinary reader would consider unimportant details. If these details are not fully carried out, success rarely results.

F. G. TICE.

Oswego Co., N. Y.

THE HIRED MAN'S SIDE.

Establish a reputation for hiring good men, paying good wages, and paying promptly.

Give your man just as much time on Sunday as is possible. Give him occasionally the use of a horse. A half holiday when fishing or hunting is good, will make him work more cheerfully, especially overtime.

Do not talk about other help, lest your present hand think you are picking him to pieces to other people.

Provide a clean room and a clean bed free from vermin. If it is impossible to give each man a separate room provide separate beds and something in which he can lock his things securely.

Set a good table, have meals served promptly, and try to provide food for which the hired man shows a preference.

Try to have his clothes washed clean, well mended and returned promptly to his room. In his room have private toilet facilities, and a pin cushion on which are several needles kept threaded with linen thread, a box of pants buttons handy, and a large brass thimble.

If he is suffering with a cold or complains of other ailments, such as chilblains or chapped hands, offer him remedies from the family medicine chest free.

Give him a chance to bathe in a warm kitchen once a week at least, with a large wash-tub.

The women folks and children do well to give their orders through the head manager of the farm, for most men dislike to try to follow instruction of more than one master.

Do not expect your hired man to take an interest in your crops, your stock and your general welfare unless you take enough interest in him to observe all and every one of these rules.

J. J. G.

FIGHTING THE PEACH BORER.

Life on a California Fruit Ranch.

I expected to write you about the results of our last year's treatment of the Peach borer by this time, but other work has occupied our time, and we have not been able to examine many trees, but as far as our observation extends the result is very encouraging. The treatment that I refer to was the application of lime, salt and coal tar to the trunks of the trees, and extending down to the roots. This was applied to our orchards in the "Willows," about 70 acres, and to all varieties of trees alike, including apple, apricot, cherry, peach and prune. Just as soon as we get at it again I will write you fully, and if the remainder of the orchards show up as well as the four or five acres that have been uncovered, I shall be very much gratified in being able to give to the fruit growers of the United States a pointer that will be of use to them in fighting this great pest. We treated about 100 apricot trees here on this ranch with several handfuls of salt put in a depression immediately about the trunk, and allowed to dissolve and wash down with the rain. No good results followed this treatment, as the borers were found there as badly as anywhere else. We have now hunted out the borers from all apricot trees on this ranch, and have applied the lime, salt and tar mixture. It is early to do this, but we wished to put Canker-moth traps on the trees, and were compelled to put on the wash first, as the traps when on would interfere with the work.

Some of your readers may wonder what we are doing on the ranch at this time of the year. As we have about 20 men to keep busy we should have accomplished something in the past two months. Before the rains came nearly the entire force was at work digging borers; 200 acres of fruit trees have been examined, and the borers dug out. All of these trees except peaches and almonds have wire moth traps about their trunks. Part were put on in 1899, and part in November, 1900, but all had to be examined to see if they were in perfect order. The moths begin to ascend the trees ordinarily about December 1. At this time we are encouraged in finding very few moths in the traps, but there are some there, and also a few have passed through or over, and we have found a few eggs in the trees. Many of the moths, in fact, nearly all, are barren of eggs. We are hoping that this pest has run its course, and that we will not need the army of men and the barrels of molasses and tar and the sulphur and flour that were in evidence in the orchards last April.

We have also dug up about 400 cherry trees, or about one-fifth of the cherry orchard, these trees having succumbed to the very dry weather of the past two or three Summers. These trees are dug out and will be cut up in four post lengths, the smaller branches being bound in bundles, and all will make fuel for the engine house. Large holes are dug, about 3½x3½ feet, and prune trees will be set therein immediately. We have also put in since the rains have softened the earth about 200 acres of barley and wheat. Our crew in the grainfields consists of three five-horse gang plows, two four-horse harrows, one three-horse harrow and one seeder, two-horse. One four-horse team worked on a harrow part of the time, and on a seeder whenever needed to even up the work and keep near to the plows. Rainy days there is wood to cut from broken Live-oak trees in the park, or about the ranch, or Blue gum trees in the grove that was planted about 10 years ago and is now growing into wood faster than it is needed. The teamsters have harness to oil and mend and other odd jobs indoors. To-day four men are shoveling over about 40 tons of prunes, and rearranging a lot of dried peaches and other fruit in the fruit warehouse.

H. G. K.

Edenvale, Cal.

THE weather last Fall and Winter so far has with us been pleasant. Farmers got their work well done. Hay and straw hold their price well up; $16 to $20 per ton. I never had apples keep as well as this year. Eggs are very scarce, and hard to be obtained, and yet the price has fallen to 28 cents per dozen. Other products remain about the same.

Top-Grafting Apple Trees.

D. W. D., Hickman, Ky.—I want to top-graft about 200 14-year-old apple trees this Spring. Is it too late to cut scions?

ANS.—No, it is not too late to cut scions for grafting up to the very day they are to be set, provided they are not injured by the severity of the preceding Winter. This can usually be told by the discoloration of the inside of the twigs, the damaged ones being brownish next the bark. H. E. VAN DEMAN.

Early Ohio Grape.

P. B. T., Visalia, Ky.—Can you tell me anything about the faults and good points of the Early Ohio grape for vineyard planting for market in the Ohio Valley? Is it vigorous, productive, free from rot? Does it hold to the stem, and not crack, and is it a fair table grape?

ANS.—Early Ohio is one of the very earliest grapes; being about one week earlier than Moore, which has long been the standard of earliness. It has a vigorous and productive vine and seems to be remarkably healthy. The fruit is quite exempt from mildew and rot. The bunch is large, the berries of medium size, black and adhere tenaciously to the stem. The flavor is good, being much better than that of most of the early grapes. It is a good variety for early market. H. E. VAN DEMAN.

Some Apples for Connecticut.

W. H. K., Bethel, Conn.—I intend setting out an apple orchard the coming Spring. What varieties would you recommend for this section? My idea is to set out mostly Baldwins. What other kinds would you recommend? How about the York Imperial and the Gravenstein, also McIntosh? Would they be good kinds for standard trees? I expect to set out about two acres in the Spring, and five acres in another year. I have an idea that I will set out my orchard like Ralph S. Eaton, of Nova Scotia, only I will set my standard trees 40 feet instead of 33 feet as Mr. Eaton does, and when I get my fillers all in my rows of trees will be 20 feet apart. Do you think 40 feet too far? I will use peach, plum and some early-bearing trees for fillers. How would Ben Davis do for temporary trees? Would the Yellow Transparent apple be a good standard? What sized trees do I want for apples, peaches and plums?

ANS.—While Baldwin is a very popular market apple it has the fault of overbearing at times, and then failing for several seasons in succession. I would not advise planting all of this or any other variety. York Imperial is too little tried north of Pennsylvania to enable us to say positively whether or not it would be advisable to plant it commercially in Connecticut. All that I would now say is to give it a test by top-grafting, that fruit may be produced as soon as possible. It is one of the standards from Pennsylvania to Colorado. Gravenstein is a very good apple in every way, so far as a Fall variety can be, but would not be so valuable for market as one that would be a true Winter variety. McIntosh is good in color and quality, but it is not a late keeper, being much like its parent, the Fameuse, but somewhat better in size and color, and some think in keeping and in resistance to Apple scab. I would advise planting both of the latter but sparingly. Sutton is more likely to be a profitable apple for Connecticut than any of those already mentioned. Rome Beauty is worthy of being tested in that section. Forty feet apart is not too great a distance for permanent trees. Peach trees as fillers are often quite injurious to the apple trees between which they are set, because they grow more vigorously and are apt to stunt them. They also require different treatment of soil to some degree; and in spraying the apple trees there is danger of some of the mixtures being hurtful to the peach trees, because the wind will naturally carry some of it on to them. The latter is true of plum trees. My own practice is to plant only apple trees in the apple orchard, after considerable experience and observation with peach trees as fillers. Yellow Transparent would make a good filler, but there is not likely to be profitable market for large quantities of the fruit. Ben Davis may be profitable there as a filler, but Connecticut is too far north for its proper development, and I think it of doubtful value. Wagener would be my preference, as it is an early and heavy bearer, and a large red apple of good quality and a good keeper. Apple trees two years old and about five feet high are the proper age and size, and such as I would plant. Peach trees should be one year from the bud, and plum trees may be either one or two years, but they should be from three to four feet high. H. E. VAN DEMAN.

Root Galls on Raspberries.

N. G. H., Stratford, Conn.—I noticed in issue of December 29 the article by F. H. Ballou referring to Prof. Selby, of the Ohio Experiment Station, and his paper on the root gall of the red raspberry. I partly set out a patch of Loudon last Fall, and will finish setting in the Spring. Of those I have dug up, 10 per cent had root galls, and nearly every gall had a few small brown worms, which from the little notice I gave them, looked like the small worms we see so plentiful in chip dirt. I set out only good plants, which are on new ground, and should be pleased to hear the best way to keep the gall in check, or get rid of it.

ANS.—The small, brown worms which you observed on the root galls of your Loudon plants are not responsible for the mischief. It is my experience that the most careful selection of plants will fail to prevent the introduction of this serious disease into the new plantation. Like the black-knot of the plum, which brought such destruction a few years ago, one may carefully prune away every trace of the trouble from a plant, only to be rewarded by a more deadly attack in a vital point apparently unaffected at the time of examination. It is to be hoped that, like the black-knot scourge, this discouraging feature of red-raspberry culture will eventually run its course. F. H. BALLOU.

The Velvet Bean in Maryland.

A. H. H., Rayville, Md.—Will the Velvet bean do all right in northern Maryland? I wish to grow it in my orchards. If you think it will give good results will you give full particulars?

ANS.—We do not feel like advising readers to plant the Velvet bean north of Georgia. We have grown it two years and last year the season was so long that the crop produced seed. The vines were not much larger than our Lima bean vines. Cow peas are better for orchards. They are hardier, will make more growth on poor soil, and are easier to work under. We know that the Velvet bean is a great success in Florida, but for the North we do not advise it.

Treatment for Potato Scab.

W. H. H., Letcher, S. D.—I have heard that at the Ames (Iowa) Agricultural College they treat their seed potatoes to corrosive sublimate, the same as wheat is treated to bluestone for smut, spreading the tubers out and sprinkling the corrosive sublimate over them until they are thoroughly wet. Is such treatment effective? Is the solution used any stronger than for soaking? Will formalin do as well as corrosive sublimate?

ANS.—We do not treat potatoes in the way mentioned in your letter, although we have made experiments with potatoes with bichloride of mercury, corrosive sublimate and formalin. In our experiments the usual methods of soaking were used. L. H. PAMMEL.

Iowa Exp. Station.

Facts About Root Gall.

F. E. B., French Creek, W. Va.—I have lately purchased some Cuthbert raspberry plants that are badly infested with root gall. Can I safely set these in my patch of healthy plants? Will you give information as to cause and prevention of Raspberry root gall?

ANS.—If the raspberry plants purchased by you are so badly affected by root gall they will surely carry the trouble with them into the new plantation. If they be worth planting at all, by all means set them as far as possible from your healthy patch, and rigidly quarantine them. A perfectly healthy plantation of red raspberries is an exception in our present day—especially in Ohio—and you are fortunate if you have one. When once affected the most critical selection of plants will fail to keep the disease out of the prospective plantation. I am somewhat surprised to hear of the Cuthbert being so badly affected; it is generally considered to be more exempt than other varieties. So far no remedy has been found for this trouble. Peach trees planted on same ground will contract it. F. H. BALLOU.

The Emerald Gem Melon.

B. G. R., Oronoque, Conn.—Is there any better kind, all things considered, than the Emerald Gem muskmelon? What is the best way to get rid of the blight, or curled leaf as some call it? Does the quality of the ground have anything to do with the flavor of the melon? If so, what is the best soil for a fine-flavored melon? Is phosphate or barnyard manure preferable? What is the best way to get the fruit early? I have raised these melons for a number of years, with very varying success. For the last two years they have been good for eight or 10 days, and have then grown comparatively tasteless. Is there any way to insure their flavor through the season? Do you think this loss of flavor applies to all melons, or can it be that the Emerald Gem is run out?

ANS.—The Emerald Gem muskmelon is considered by most eastern growers to be the highest in quality, but it is small in size and often cracks badly before ripening. We have succeeded better with the Paul Rose, and find the quality almost as good, and the size and keeping qualities much better. The very destructive leaf blight of melons has not been well studied, and no effective remedy is known. It can best be avoided by early planting and stimulating culture. A light, well-drained soil produces the best melons, other conditions being equal. The secret of melon-growing seems to be to keep the soil filled with decaying vegetable matter, and for this purpose there is nothing better than rotted barnyard manures. Chemical fertilizers are useful to give the young plants a start, but can seldom be depended on to carry the plants to maturity. Use stable manure in the soil, and chemicals in the hill, or later as a dressing. Early melons can be had by starting the seeds in three or four-inch pots, under glass, and carefully planting them out as soon as the weather is sufficiently warm. The loss of flavor is common to all varieties some seasons, and depends greatly on weather conditions. The Emerald Gem has certainly not run out. As tested by the writer on Mr. Burpee's Fordhook trial grounds the last two seasons it was still ahead of all others in quality.

A Cement Floor.

J. T. H., Chambersburg, Pa.—I wish to build a general-purpose house for washing, butchering, preparing produce for market, etc., the building to have cellar for vegetables, so it is necessary to have a floor that will keep water from dropping through. Is there anything better than cement? How can I make it?

ANS.—While it is not at all difficult to lay a cement floor it is well to have the advice and assistance of a local mason. The main thing is to get a good foundation of broken stones or bricks at least six inches deep. The cement can then be mixed dry with its bulk of coarse, sharp sand, or fine gravel. Add water and mix very thoroughly until it is a soft uniform mortar. Pour over the foundation, tamping down well until it fills all crevices between the stones. In about 24 hours another thinner coat may be smoothly spread over the surface, making everything level. Cover with hay or straw for several days to avoid too rapid drying and cracking. There is nothing better than cement for the purpose.

Chance for a Small Greenhouse.

F. B. C., Eugene, Ore.—I am situated three miles from the county seat, population about 4,000; State university located here. I commenced gardening here nine years ago, without any knowledge of the business; now have a nice home and a fine trade, both retail and wholesale. Would you advise the taking up of the flower business along with the other, and should I try cut flowers or plants, or both? There is no one doing this kind of work near here. I have about 5,000 square feet under glass, and could add more if it would pay. I am 40 years old, have good health and used to hard work; can hire a man for $200 a year, he to board himself; I to furnish house and vegetables. What are my chances for success?

ANS.—It is a difficult and often thankless task to advise in regard to local business conditions, but we think F. B. C. is well justified in venturing into the production of flowers and ornamental plants for his customers, provided he has a liking for the business. It will be safest to begin in a small way, with popular and easily-grown plants, and such flowers as carnations and violets, which do not demand as high temperature and costly equipment, as the more exacting roses. There is often more satisfaction and profit in a small local florist's business than in more expensive metropolitan establishments, where competition is so keen that only the highest class of products is salable at all. While the immediate demand is not likely to be great your excellent local conditions should develop a growing trade.

The Young Man in Politics

By Grover Cleveland

Former President of the U. S.

IN THIS WEEK'S (JAN. 26) NUMBER OF

THE SATURDAY EVENING POST

OF PHILADELPHIA

A handsomely illustrated and printed weekly magazine, with a circulation of 300,000 copies. Established 1728.

EVERY FRUIT GROWER SHOULD READ R. M. KELLOGG'S NEW BOOK, ENTITLED

GREAT CROPS OF SMALL FRUIT

AND HOW TO GROW THEM. The author has grown the largest crops of fancy fruit ever produced on an acre. In his experimental grounds are single plants which yield over FOUR QUARTS each of fine large berries. His customers have done as well. This has been accomplished by SCIENTIFICALLY BREEDING up plants to a high fruiting vigor so they throw their energies to the development of fruit instead of useless runners. The profit comes from a big crop of big berries that sells at sight to regular customers. This book tells you all about how it is done. THE CHEAPEST PLANT is the one that will give you the best fruit and most of it. You can't afford to play second fiddle on the market by using scrub plants. The only stock of scientifically-grown thoroughbred plants in the country for Spring planting. Send your address at once, and get a copy of this book, and a revised edition for three years FREE. R. M. KELLOGG, Three Rivers, Mich.

THE PARAGON APPLE.

For several years past there has been confusion in the minds of most pomologists, and among the nurserymen as well, regarding the identity of the two apples now properly called Paragon and Arkansas, both seedlings of Winesap, one originating in Tennessee and the other in Arkansas. While they are perhaps equal in all essential points they are distinct in individuality. The Arkansas is also called Arkansaw, Mammoth Blacktwig and sometimes Paragon. The latter synonym was given by mistake, many of us thinking at one time that the Tennessee variety had been taken to Arkansas and by mistake renamed. Many trees of the Arkansas have been sold by the nurseries under the name Paragon, which was done because of this mistaken idea. Not long since I was shown in Kentucky a number of apples from a tree that came direct from the stock of the true Paragon tree in Tennessee. I selected one of these, and have made a life-size drawing, Fig. 24, and a written description as well. This variety is of medium size; oblate conic in shape; has a short stem, is much like Winesap in color but darker and not so distinctly striped, being a dull, dark, mixed red, with almost no appearance of stripes; the flesh is yellow, not very juicy but of good, firm yet fine texture; has a small and nearly closed core; perfect seeds; pleasant subacid flavor and good quality. It keeps about the same as Winesap. The tree is of much better shape than its parent, being more upright and regular in habit. The Paragon is worthy of trial where the Winesap is popular. The original tree was found by Dr. W. L. Moores growing in the orchard of Maj. Rankin Toole, near Fayetteville, Tenn., 30 or more years ago.

H. E. VAN DEMAN.

THE IDAHO PEAR—BLIGHTED.

At the time of its first introduction it was thought by Prof. Budd and many others that the Idaho would prove to be blight-proof or more nearly so than almost any other variety of pear. Unfortunately such has not proven to be the case. Until about four years ago the blight was practically unknown in this section of the country; when it made its appearance the Idaho was the first victim to its ravages. The blight came in a virulent form; the peculiar odor emitted by the blighted foliage could be distinguished quite a distance. Thousands of the trees were dug up the past season; it now looks as though there would not be any left in a year or two more. This is very much to be regretted, as the fruit was very fine; I think the most valuable pear we had, not only as a fresh fruit, but also for canning, and especially for drying. Three years ago, at the Spokane (Wash.) Fruit Fair, which is the leading fruit exhibit in the Pacific Northwest, there were more plates of Idaho pears on exhibition than of all other varieties combined. They were sent in from all the different sections of country. Thousands of the trees were planted all over the Northwest, and had it not been for the scourge of blight the fruit would have been in such abundance that it could have been shipped east by carload lots. The quality of the fruit has continued equal to the best specimens ever sent East. I think those I had the past season would have weighed about 20 ounces on an average, while occasional specimens weighed over 30 ounces. While I regard it as a great misfortune to lose so fine a fruit from the list of pears I do not know anything that can be done to stop the ravages of the blight, especially when it is so virulent.

Idaho. JOHN H. EVANS.

THE Idaho pear has gone out of date in this part of the country. The leading pears here are Bartletts and Winter Nelis.

Oregon. R. P. G.

The Sutton Apple.

Can you inform me concerning the merits of the Sutton apple? Also, whether it is a desirable variety for either market or home use? G. E. H.

South Framingham, Mass.

Sutton is an apple that originated at Sutton, Mass., many years ago, and has been tested quite extensively in some of the more northern States and in Canada. It seems to do well there, as the tree bears well and has no serious faults. The fruit is of medium size and roundish in shape. The color is red and yellow, mixed and striped, making a very attractive appearance. The quality is very good, being a pleasant subacid. It keeps about as well as Baldwin where the two are grown in the same locality. It is good for both home and market purposes. H. E. VAN DEMAN.

Stayman's Superior Apple.

I write to inquire about an apple that I planted in 1893, called Stayman's Superior, which bore the past year for the first time. The tree is quite irregular in growth, with a low, wide spreading head, and limbs which are inclined to point to all parts of the country. The fruit is of full medium size, deep blush-red in color and with fine-grained, juicy, very rich, high-colored flesh, that is as exquisite in taste as that of any pear. It has not proved an early bearer with me, and I would like to inquire what others know about it. In tree it agrees fairly well with Stayman's Summer as described by Downing in his First Appendix, but mine is an October apple and differs in many ways from the other in fruit.

Illinois. BENJ. BUCKMAN.

This is one of the seedlings originated by Dr. J. Stayman, of Leavenworth, Kan., and, I believe, from seed of Winesap, which it resembles in habit of growth. It is rarely found, even in the most extensive experimental orchards of the country. Just how it will behave in the country at large is not known, and any further information concerning it will be prized by many.

H. E. VAN DEMAN.

The Strong Points of the Elberta Peach

Hardiness, thriving anywhere within the peach belt.

Large size, marketable even when allowed to overbear.

Fine appearance, so beautiful that it sells at sight at highest rates, even when the market is glutted with other sorts.

Freedom from rot, even when fruit on adjoining trees of other kinds was badly affected.

Not stung by insects; curculio, wasps, etc., let it alone, while they did serious damage to other nearby sorts.

Does not drop; successfully defies the winds and hangs on persistently through the hardest gales.

Is a good shipper, standing up well after a long journey.

This is the writer's experience, and for commercial purposes he would advise planting Elberta largely. For home use, only sparingly, for like all of the North China type, it is not up in flavor to many of our standard sorts, yet for its many proved excellences it is destined to peach immortality, and the wise man who raised and introduced it—the sole survivor of 25,000 seedlings—deserves to be held in lasting remembrance by grateful posterity. J. YATES PECK.

WHEN you write advertisers mention THE R. N.-Y. and you will get a quick reply and "a square deal." See our guarantee 8th page.

HOPE FARM NOTES.

SHREDDED FODDER.—I spoke last week of our Leslie or St. Albans corn shredder. We have a good supply of dry cornstalks. They were cut and cured properly, and I feel sure that they are worth, ton for ton, half as much as good Timothy hay. The horses did not eat them well. They nibbled off the leaves and upper stalk, and left the long butts untouched. I don't think we realized over 40 per cent of the feeding value of the stalks, and the manure gave us the backache every time we looked at it. After much thought I decided to get a shredder. This machine is adjustable—that is, you may, if you like, put in a regular knife-head which slices or chops up the stalks in the usual way. If you wish to shred, this knife-head can be taken out and another put in its place. The shredder consists of a number of small sharp teeth. If you were to put small sharp chisels at the ends of your fingers, and then claw at the fodder sharply with the palms down you would give a fair imitation of the work of this shredding cylinder, which runs at the rate of 1,000 revolutions per minute, and fixes those stalks so that they take very little stock in themselves when they feel the touch of those fingers.

ALL BROKEN UP.—We were able to hire a portable steam engine. A big "barrack" behind the barn was full of husked fodder. Charlie fastened the shredder to the barn floor, put on the belt, ran his eye over the whole outfit and said: "Get up!" There was a hiss and a groan, and off they went. A big bundle of tall, thick cornstalks lay on the table. All through the Fall this bundle had been lying in the barrack bragging that no live animal on Hope Farm was man enough to destroy its identity. Other bundles had been carried into the barn, and a few days later they came out of the back door to the manure pile—a little stripped and bruised, but still—*stalks*. These old veterans called over to their friends in the barrack, "Never touched me! Wait till we get on his manure fork!"

So the big stalks on the table of the shredder had no fear until they began to move. Then they surely thought something had hit them. A big fluted roller caught them and hauled them along to where a whirling shower of keen, narrow knives pounced upon them and tore them so that even the cornfield crows would despise them. There was a roar and a shriek, and out they dropped so smashed and mangled that when the few fragments reached the manure pile their former comrades failed to recognize them. It was about as practical a change as it would be if you buried a big stalk in the ground and grew a young, tender one from it. With 60 pounds of steam the engine made play with the cutting knife-head. With 80 pounds the shredding cylinder made her puff! The difference in power was shown in the fodder!

CORN HAY.—The shredder worked so well that the boys kept on until the entire barrack was emptied. It filled a big box stall and three other small ones, besides a big lot on the barn floor. It may not all keep—but we will have a chance to find out! We use a bushel basket for feeding; the stuff is really too fine and silky to handle with forks. The horses now eat over 85 per cent of the stalk—that is, they handle more than twice as much as they did when the stalks were fed whole. The orts are now chiefly the pith and the lower part of the stalks, which were damaged by rain in the barrack. We have begun feeding waste beet molasses along with the shredded fodder. This molasses is very thick and heavy. We mix it with water and pour the mixture over the stalks. I am not yet able to tell what value to put on such molasses. We have fed no hay thus far, and do not expect to feed any up to April.

CRUDE PETROLEUM.—We get numerous letters like the following:

On page 832 Prof. H. E. Van Deman says that more than 25 per cent of crude petroleum is dangerous to fruit trees. Bulletin 14 of the New Jersey Experiment Station says use it clean. N. W.

The facts are that "crude petroleum" varies considerably. Some of it may be used clear without damage, while other samples would kill the trees if it were not diluted. The safe way is to have the oil tested, for there is a reliable test that will show when the oil is dangerous. I know about this, because your humble servant happens to be an office holder. Yes, I know, the people of Bergen County defeated me last Fall by a great majority—but "you can't keep a good man down." The Governor of New Jersey evidently knows an expert when he hears about him, for I have been appointed San José scale commissioner. I have the tools for testing the oil, and after I have tried some experiments of my own I will attempt to tell about it.

BELATED COW PEAS.—A friend in Pennsylvania sends these questions:

Please tell me, if you can, whether Black cow pea seed on the stalks standing in the ground at this time will grow if taken care of now? They were ripe before the frosts came and were left in the ground through carelessness. I do not wish to go to the expense of harvesting if the seed will not grow. My idea is those that have not came in contact with the ground would be all right, but the others I am afraid are partly rotted. C. D. G.

We are in much the same boat. A large share of the Black cow peas were never picked. Many of them have shelled out and are, of course, worthless. Some are still in the pods—held up from the ground. They look plump and clean, but I doubt whether they will make good seed. Our test is to pick a few, dry them carefully and then see whether they will sprout. They may be planted in a flower pot with a house plant, or put in a germinator. This can be made by placing two sheets of moist blotting paper between two dinner plates. Put the cow peas between the pieces of paper and cover with the plates. If any fair proportion of the peas sprout it will pay to pick them. We doubt whether the Blacks will sprout. The Whippoorwill pea has a very hard thick pod, and is more likely to be alive.

WINTER JOBS.—I have had a number of suggestions about profitable jobs for the Winter. I don't know whether they are all tested or not. Here is a new idea:

In regard to profitable Winter labor on farm, spoken of in Hope Farm Notes, please accept the following suggestion for what it may be worth: A few acres planted to witch hazel might be worth trying. The seed could be bought of Thorburn, of New York, the plants set about six feet apart each way, and in a few years would be ready to be cut, bundled up and sent to the factory where the oil is distilled. The sprouts from the stumps would probably be big enough to cut the next Winter, and each succeeding Winter you would have work that would require no special skill and that would bring cash returns.

That seems sensible, but I am not familiar with crops of that sort. I have heard of farmers who distill these essential oils, and if there are any such among our readers I wish they would tell us about it. Surely the extract of witch hazel is soothing and wonderfully healing. Perhaps the work of extracting it from our loafer fields would heal the face of the farm and sooth the gall of the mortgage on my pocket nerve. I will look that scheme up. It evidently beats broom corn! Still another scheme for Winter jobs is suggested by a Cape Cod man as follows:

One of THE R. N.-Y. hobbles is the disposition of the old dairy cow. Of course, if you have a cow that for sentimental reasons you refuse to make into beef, all right. But an old cow may make decent beef. I always have mine butchered—killed one December 8; sold something over three-fourths to neighbors, and have now just put away a piece of round or chuck frozen hard to try to keep frozen through next thaw. I think you could solve the problem of Winter work by picking up old cows in Fall—new milkers or otherwise—feed them fat and take the milk as you go along. When the milk will no longer pay for feed, butcher and dispose of best you can. If no better way make into mincemeat and so find a market for unsalable apples.

I have heard of this before, and feel quite sure it would work. If sheep could be bought at fair prices I think they would pay better, for the butchers will take such small carcasses. Cows have been very cheap the past season in some of the dairy districts of New York State. At one time I thought of buying several, but gave it up for good reasons. While old cows do not make the best of beef they may be fattened so as to make fair quality. The beef business in our part of the country is entirely controlled by the dressed-beef trust! I don't know about the justice of a family that eats as few pies as the Hope Farmers selling "pie timber" to others! H. W. C.

WHEN you write advertisers mention THE R. N.-Y. and you will get a quick reply and "a square deal." See our guarantee 8th page.

ACME PULVERIZING HARROW

To be returned at my expense if not satisfactory.

The best pulverizer and cheapest **Riding Harrow** on earth. We also make walking Acmes. The Acme crushes, cuts, pulverizes, turns and levels all soils for all purposes.

Made entirely of cast steel and wrought iron—**indestructible.**

Catalog and Booklet, "*An Ideal Harrow*," by Henry Stewart, mailed free.

Free on board at New York, Chicago, Columbus, Louisville, Kansas City, Minneapolis, San Francisco, etc.

DUANE H. NASH, Sole Mfr., Millington, New Jersey, and Chicago, Ill.

$2.50 CASH will buy the BEST **DUTTON** Knife Grinder EVER MADE.

$5 CASH Buys a $10 ROOT CUTTER at the **CUTAWAY HARROW CO.** Higganum, Conn.

ORCHARD PLOW.

CLARK'S Double-Action CUTAWAY HARROW.

EXTENSION HARROW.

PLOW

Send for circulars

Wood Saw Machines

6 sizes; hand or self-feed. 15 to 75 cords per day. **SMALLEY** and **BATTLE CREEK Drag Saws.** No. 2 Self-Feed Battle Creek Drag Saw, for 2 to 4 horses. Price $85.00; with power complete, $150. Famous Electric Circular Saw Machine. The best Long Timber or Pole Saw on Earth. We also make Ensilage and Fodder Cutters, Grinding Mills, the Battle Creek Bolting or Slat Mill. FARM POWERS. Cat. and introduction prices to any one naming this paper.

SMALLEY MFG. CO., Sole Makers, **Manitowoc, Wis.**

Big Gardeners

frequently fail to secure normal profits because dry weather prevents crops from utilizing stable manure; it "fire fangs," burns up and dies. This trouble does not, cannot arise where they use sufficient supplies of

Nitrate of Soda

to force all their crops to early maturity. The *cheapest* and *most effective* of all Nitrogenous fertilizers. Write for free book to **John A. Myers,** 12-O John St., New York. *Nitrate for sale by fertilizer dealers everywhere.*

Write at once for List of Dealers.

Choice Vegetables always bring high prices. To raise them successfully, a fertilizer containing at least 8% Potash should be used.

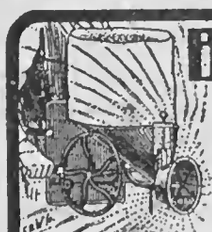
Our books furnish useful information on all subjects relating to crop raising. They are sent free.

GERMAN KALI WORKS
93 Nassau Street, New York.

Broadcast

Seeding is made easy and effective by the

Cahoon Broadcast Seeder



sows five times faster than by hand. Saves one-third the seed. Sows absolutely even, thus insuring good crops. Does't wear out. Anyone can use it. Ask your dealer about it.

GOODELL COMPANY,
14 Main Street, ANTRIM, N. H.

THE LIGHTNING SEED SOWER

Guaranteed to sow 60 acres per day (either horseback or on foot) of Clover, Timothy, Millet, Flax, etc. Will be sent to any Post Office on receipt of..... $1.25

If not satisfactory, money refunded. Circulars free. Agents wanted.

W. J. BUSS, 53 Day St., Golden, Ill.

THOMP SON'S GRASS SEEDER

Sows all clovers and any other grass, no matter how chaffy. Sows 20 to 40 acres a day. Beats the wind and wet.

Special Hopper for wheat, oats, etc. Weighs only 40 lbs. LASTS INDEFINITELY.

Don't buy a seeder until you send for our free illustrated catalogue.

O. E. Thompson & Sons, Ypsilanti, Mich.

WELL DRILLING Machines

Over 70 sizes and styles, for drilling either deep or shallow wells in any kind of soil or rock. Mounted on wheels or on sills. With engines or horse powers. Strong, simple and durable. Any mechanic can operate them easily. Send for catalog.

WILLIAMS BROS., Ithaca, N. Y.

LAND DRAIN TILE

(Car-loads or less).
Sizes, 2, 2½, 3-inch and up to 15-inch.
WILLIAM T. LEGGETT & CO.
1025 Liberty Avenue, Pittsburgh, Pa.

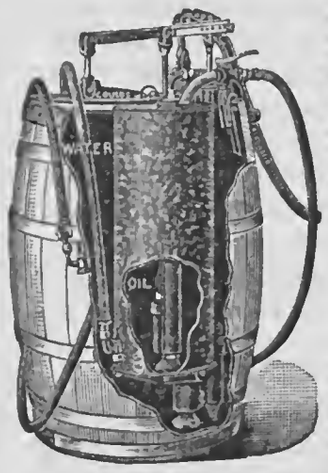
WHY

Can we Save You Money on a vehicle, harness or a fly net?

Because we have no agents.

Can we really do it? We say yes. Can we prove it without cost to you? We can. How? We will ship you a harness, saddle or vehicle, without you sending a single cent, and let you look it over at your freight house and if you don't find we have given you the biggest bargain you ever saw or heard of, return the goods to us at our expense. We give with each vehicle a 2-year iron-clad guarantee, protecting you from poor material and workmanship. Our vehicle catalogue describes the largest line of buggies, road wagons, phaetons, surries, spring wagons and carts, harness and fly nets ever shown in one book. It's free. Send for it.

Marvin Smith Co. 55-59 N. Jefferson St. U-2 Chicago, Ill.



(PATENTED).

Goulds "Kerowater" Spraver

For Emulsifying and Spraying Kerosene and Water.

Endorsed by the leading Horticulturists and State Experimental Stations. A kerosene sprayer which *accurately* proportions the mixture for any desired strength. Built in three sizes, for tank, barrel or knapsack use. There is a great demand for them. Ask your dealer or write direct to us.

"How to Spray, When to Spray, What Pumps to Use," a valuable Booklet, free for the asking.

SUBSCRIPTION: ONE DOLLAR A YEAR.

To foreign countries in the Universal Postal Union, $2.04, equal to 8s. 6d., or 8½ marks, or 10½ francs.

"A SQUARE DEAL."

We believe that every advertisement in this paper is backed by a responsible person. But to make doubly sure we will make good any loss to paid subscribers sustained by trusting any deliberate swindler advertising in our columns, and any such swindler will be publicly exposed. We protect subscribers against rogues, but we do not guarantee to adjust trifling differences between subscribers and honest, responsible advertisers. Neither will we be responsible for the debts of honest bankrupts sanctioned by the courts. Notice of the complaint must be sent us within one month of the time of the transaction, and you must have mentioned THE RURAL NEW-YORKER when writing the advertiser.

Name and address of sender, and what the remittance is for, should appear in every letter.
Remittances may be made in money order, express order, personal check or bank draft.
THE RURAL NEW-YORKER,
409 Pearl Street, New York.

SATURDAY, JANUARY 26, 1901.

LAST Fall we called on farmers to report the figures which buyers were offering for apples. The result was a mass of information which told the story and helped stiffen prices. Now we want at once the figures offered by canning factories for peas and other vegetables. Send us as soon as possible a statement of what the canners offer, and a sample contract. The situation is such that these facts and figures sent right at this time will enable us to help the growers—especially those who plant peas. Get together, farmers! Let us have these facts at once!

*

A PORTABLE thrashing engine was recently used in rather an unusual way by a New Jersey florist. The 60-horse-power boiler used in heating burst, and it was impossible to heat the greenhouses. A steam engine belonging to a thrashing outfit was brought into requisition, steam being supplied by a one-inch pipe running from the dome of the engine, and connecting with the large main of the greenhouses. The main return pipe was disconnected from the damaged boiler to allow exhaust steam to pass out. By this means frost was kept out of the houses until the boiler was repaired. Why not thrash Jack Frost as well as old straw?

*

IT is easy to point out the advantage of direct dealing between farmer and consumer. In many thickly-settled places it seems all wrong to pay a tribute to the peddler or the merchant when the farmer lives within a few miles of the people who eat what he produces. Some farmers like a retail business, but most of them seem to prefer a wholesale trade, except for such things as eggs and butter. Most farmers who have become experts at producing crops cannot afford to stop and peddle out their goods. At least they think so, but are they right or wrong? Mr. Townsend, whose methods are given on page 50, appears to have an original plan of selling.

*

ON page 8 THE R. N.-Y. made some statements about the use of oxygen which are wrong, and we desire to correct them. It is said that the French have devised some cheap method of separating the oxygen from the nitrogen as it exists in the air in a mechanical mixture. Oxygen promotes combustion. When it is present fuel burns with a fierce blaze and great heat. The oxygen itself does not burn, and will not add to the world's supply of fuel. It may, perhaps, be used to make fuel burn more rapidly, and will possibly save heat by giving a more perfect combustion. It will not, however, with our present knowledge of chemistry, add to the world's supply of fuel, and we regret that our statement gave that impression.

*

A CERTAIN farmer was once made chairman of the political organization in his township. It was a close campaign, and many of the township chairmen were called to headquarters to see the State chairman; among others our farmer friend was called. The question of distributing "literature" came up. There was one pamphlet in particular advocating a policy which this farmer felt sure was positively against the interests of country people. To his surprise the State chairman said that he was opposed to this measure personally, but that it was a good party policy to advocate it. Here was a man talking and writing with all his power in favor of a plan which he knew would result in trouble and injustice to many country people! The worst of it was that this man knew that he deliberately deceived thousands of honest, simple-minded men who had such confidence in him that they accepted his suggestion as a political command! Suppose that man had spoken just what he believed—fearlessly and without dodging! His party would probably have rolled over him and buried him from view, yet the world would have been better for it. "Statesmen" are apparently much like other persons—perhaps "more so." They believe in advancing their own interests first of all.

*

OSWEGO County, N. Y., is famous for the strawberries which are fruited late in the season. The growers try to produce large, firm, high-colored berries that will stand long shipment. F. G. Tice is unquestionably one of the best growers in Oswego County. He can not only grow the fruit, but he can tell how to do it. That is why we asked him to write one of those "essential-principle" articles which we have promised. What we ask you to remember is that back of the 1,000 words which Mr. Tice has written stand several million little details which he has carefully attended to year after year! The next "essential-principle" article will discuss currants and their culture. It is written by W. N. Scarff, of Ohio, who had so much confidence in fruit growing that he borrowed every dollar he could raise to invest in fruit land.

*

SOME of the men who keep a pig in a little box or pen where the poor porker wallows in mud and lives on soup may open their eyes at the story of western hog-raising, told on first page. The western farmer is usually a man of large ideas—he grows crops on a large scale, and is used to methods which Eastern farmers call "liberal" or wasteful as they wish to speak politely or bluntly. We are apt to say that western farmers need to study some of the saving, smaller methods of the East. That is true, but it is no less true that many eastern farmers need to let out their belts and follow some of the larger practices of the West! In this matter of hog-raising, for instance, the eastern farmer will do well to take an ax, knock down his small pen, and let the hogs out into a field where he sowed rape, sorghum and other grazing plants. All the hog wants is a fair chance!

*

THE Indiana Appellate Court recently decided a case involving the death of three cows caused by their experimenting on a diet of coal. Nelson Bart owns a large farm near Fort Wayne. A ditch was ordered across his pasture, and Freemont Sprangle, the contractor, who was working on the ditch, brought to the pasture a large amount of machinery, including a lot of coal and coal-oil waste. Sprangle's men were boarding with Bart, and one of them, at the dinner table, gave out the information that Bart's cattle were eating the coal. This was commented on as a very astonishing circumstance, but Bart still left the cows in the pasture. A week after two of them were found dead and the third dying. On cutting them open their stomachs were found packed full of coal. "It looked," said Bart, "as if it had been hammered in." One of them had also partaken of a liberal supply of coal-oil waste, which was found wadded with the coal. Bart sued Sprangle for negligence in leaving the coal within reach of the cows. The jury gave him a verdict for $150 for the value of the cows. This judgment the Appellate Court affirmed.

*

SECRETARY of Agriculture James Wilson has declared in favor of the Shipping bill which provides large subsidies for American ships. He says that farmers need better freight service to foreign countries and gives instances to show where important freight has been delayed. He then says that from every point of view we should not depend on foreign ships, but that Americans should carry American freight. We agree with the Secretary, though we know from experience that it often pays better to hire some one else to carry your produce than to do your own hauling. If Mr. Wilson wishes to give the farmers real advice he should not stop with what they already know, but go on and tell us why the rich ship builders and steel makers need help from the Government. That is the point to be discussed. Why should the farmers be taxed to support a class of people who are better able to provide for themselves than most business men? Mr. Wilson is quoted as saying that he "knew from correspondence that there is a practically universal sentiment among the farmers in favor of the bill, and that those who are against it are mainly those who do not understand what advantages the bill will bring to the farmers." Our experience and observation indicate just the reverse of that statement. The farm papers of the country are outspoken against the bill. The few farmers who talk to us in favor of it seem to have an idea that it is a party measure which will make their party stronger with certain rich men, or in certain localities. There are many farmers who now see in their own business the results of former indirect taxation schemes. Here is their question, Mr. Secretary—perhaps you will answer it. Why, if our manufacturers can outdo the world on machinery and material, do they not build their own ships without help?

*

HERE is a letter from a subscriber who writes what thousands think:

We note your advice to snow United States Senators under with letters giving our wishes in regard to oleo legislation. Would they ever reach the eye of the Senator? Would not the omnipotent private secretary consign them all to the waste basket and say nothing about it? I know that all classes in this vicinity are very anxious to have the Grout bill made the law of the land, and if our Senators ignore our wishes and interests the time will surely come when they will hear from us.

The impression that Senators do not see communications from their constituents seems to be a common error. The idea was expressed before the Senate committee during the hearing on the oleo bill by one of the oleo men. Senator Proctor, chairman of the committee, corrected him, saying that all such communications received attention, and while they could not remember the details of each letter, they always knew in a general way from such letters what the people want. There never has been a time in this country when farmers followed up these matters as they do now. The result is that never before did their wants receive so much consideration. One advocate of oleo in the hearing referred to told the committee that it was not the farmers, but other meddlesome individuals who were asking this law. He said: "You know, Senator, that farmers have no time to leave their plows and their cows and follow up legislators." "I know," promptly replied Senator Allen, of Nebraska, "that they come pretty close to it at times." The Senator knew more about that subject than the lawyer who was earning his fee talking for the oleo frauds. It is the farmers' duty to let their Senators know that they do want this bill. Have no fear that your letter will not be read. A politican may not tell the people what he honestly thinks about them, but he is very glad to learn what they honestly think about him.

*

BREVITIES.

THE ROGUE'S PARADE.

Drum! Drum! Here they come, Fraud, Fake and Buncombe!
Ho! Ho! There they go. Led by Oleo!
See him strut and hear him crow!
"What do I care for law, you know?
Honest butter's on my track,
But the boodle's at my back!
What care I for honest right?
Greasy dollars win the fight!"
Next come lightning rods—they drag bills in wads!
See that canning shark? Now farm shins will bark!
Ah! There! patent churn! Sign his card, you'll learn
That the sig. you wrote—turns up as a note,
Here's commission merchant thief
Sucks you dry and then in grief
You can only grunt and groan,
He skips out for parts unknown.
Toot! Toot! Better scoot!
Here comes Uncle Public Wrath,
See his gun? There'll be fun!
When through you he cuts a swath! W. W. H.

NOT much use for a snow shovel yet!

TRY Alfalfa, but don't get crazy over it.

A CHECK book removes one bait for a burglar.

THOSE rules for the hired man's treatment on page 51—are they fair?

THE French mushroom crop is said to amount to $2,000,000 annually.

MAN puts his mind to most ignoble uses when he goes hunting 'round to find excuses!

IT'S a case of "roast" beef when an institute man gets his tongue after a scrub.

HAVE you noticed any difference in varieties of asparagus as to their liability to rust?

ALL a good man has a right to ask for is a fair chance. The oleoists had a fair chance to be honest!

THE way to make a boy "cranky" is to work him on an old-fashioned grindstone and hold down hard with the ax.

DON'T expect too much from the Grout bill. It will never feed your cows for you, or enable you to make clean butter from dirty milk!

WHICH section of country will come out ahead—the one in which labor is skilled and high-priced, or the one in which it is poor and cheap?

A KANSAS paper suggests this subject for debate at a local literary society: "Should a farmer invest his money in life insurance or cabinet organs?"

FLORISTS are somewhat disturbed by the rumor that the price of window glass will be increased again 15 per cent during January. The beneficent glass trust appears to be flourishing merrily.

THE growth of Water hyacinths in the St. John's River, Florida, is again causing difficulty by blockading navigation, and the Government will be asked to aid in the removal of the plant.

IF my horse reaches two feet into my neighbor's field and steals his grain I must pay for it. If his tree sends its roots over into my field for 10 feet and steals the plant food which I meant for my corn, must he pay for that?

Events of the Week.

DOMESTIC.—Fire broke out in the Eric Basin, on the water front at Brooklyn, N. Y., January 9, starting on the steamer Idlewild. It spread to surrounding shipping, and the damage is over $500,000. . . . The overdue Alaska steamer Tillamook was hemmed in by ice in Saldova Bay, Cook Inlet, and finally wrecked. She had 50 passengers on board, and a steamer was sent to rescue them. . . . A smallpox epidemic at Murray, Iowa, has caused the closing of schools and churches. A portion of the town is under quarantine. . . . Gates Mills, O., is entirely cut off from the outside world by a smallpox quarantine. January 8 there were 40 cases, and it was feared that the medical resources of the village were unequal to the situation. . . . A panic caused by a cry of fire during a theatrical performance in a hall in Chicago, January 12, caused the death of four women and two children, who were trampled to death. Many other persons were injured. . . . The United States Supreme Court, January 14, made a decision in the Neely extradition case. The Court held that Neely was subject to extradition, and must be surrendered to the Cuban authorities; that Cuba is foreign territory, our only purpose in the war with Spain being to free the Cubans from Spanish domination. . . . Alvord, the defaulting New York bank official who embezzled $620,000, has received a sentence of 13 years imprisonment.

CONGRESS.—The United States Senate January 10 made considerable progress with the Army Reorganization bill. The committee amendments were disposed of, and those providing for the appointment of Generals James H. Wilson, Fitzhugh Lee and Shafter, to be Major Generals of the regular army and retired, prevailed, despite bitter opposition from Mr. Pettigrew. An appeal was presented by Mr. Teller, of Colorado, from more than 2,000 persons in Manila, urging the Government to cease its operations against the Filipinos. The appeal was so unusual in form that Mr. Hawley, of Connecticut, objected to its publication as a document, and declared that it was treasonable denunciation of the Government and an attack upon our soldiers. . . . In the House January 12, Mr. Pearson, of North Carolina, introduced a bill empowering the Secretary of Agriculture to purchase land suited to the purpose of a national forest reserve in the Appalachian Mountains, within the States of Virginia, North Carolina, South Carolina, Georgia, Alabama and Tennessee, not to exceed in extent 3,000,000 acres. Five million dollars is appropriated for the purpose. . . . The House Committee on Post Offices and Post Roads, January 15, practically completed the Post Office Appropriation bill, the total of which will be about $122,748,000. The item for rural free delivery is increased from $1,750,000 to $3,500,000. No provision is made for pneumatic tube service. The Naval Appropriation bill, completed in committee January 15, carries $77,000,000, an increase of $11,000,000 over that for the present year. Two new battleships and two cruisers are provided for, but no additional submarine vessels are recommended at present.

GENERAL FOREIGN NOTES.—The recent blizzard throughout Russia stopped all traffic on several railways, and the poor in many outlying districts are nearing starvation. All business in Odessa was stopped for several days, and prices of provisions advanced 500 per cent. Some of the trains were blocked in the snow for six days, and the passengers suffered much distress, some of them being frozen to death. . . . An explosion in a hat factory near Manchester, England, January 14, killed 10 persons. . . . The Italian steamer Leone was wrecked near Corsica, January 14; 15 lives lost. . . . Venezuela has seized two steamers belonging to the Orinoco Shipping Company. They sail under the British flag, but the majority of the stock is owned by Americans, and it is believed that the aggression is the result of the controversy over the asphalt beds, and is part of a plan to dispossess the American holders of the concession by force. The Colombian government recently seized a British vessel under similar circumstances, but paid $30,000 indemnity when visited by the gunboat Pheasant.

FARM AND GARDEN.—The Montana State Arid Land Commission has let a contract to L. D. Beary, of Helena, for a 50-mile irrigating canal, intended to reclaim 33,000 acres of land located in the northern part of Lewis and Clarke counties, of which Helena is a county seat. The contract price is $412,000, to be paid in bonds which are to be secured by the lands sought to be reclaimed, and the work must be completed within three years. The contractor also agrees to place settlers upon the lands. Work on the canal will be commenced next May.

At the annual meeting of the American Beet Sugar Association at Detroit, Mich., January 9, the association adopted a resolution earnestly protesting against any form of reciprocity that would sacrifice protection to the domestic sugar-growing and manufacturing industry. It was also agreed to protest against the suspension of duty on Russian sugars, and especially in the face of reports by Government experts that Russia pays a sugar bounty.

At the meeting of the Illinois Dairymen's Association at Aurora, Ill., January 8, a resolution indorsing the Grout bill was the first business considered. About 300 dairymen from Illinois, Wisconsin and Indiana were in attendance. Among the speakers were C. P. Goodrich, president of the Wisconsin Dairy Association, Prof. T. L. Haecker, of the Wisconsin State dairy school, A. H. Jones, of Robinson, Ill., State Dairy, and Food Commissioner, G. A. Wilmarth, president of the State Farmers' Alliance, and Prof. Davenport, of the Illinois Agricultural College.

The thirteenth annual meeting of the Illinois Swine Breeders' Association convened at Taylorville, Ill., January 8, about 150 members being in attendance.

The Illinois State Pigeon and Pet Stock Association opened its seventh annual show at Bloomington January 10. Among the principal exhibitors were T. H. Ayers, Hoopeston, Cochins; George Attig, Chenoa, Black Langshans; W. E. Nesbitt, Bloomington, Bantams; C. A. Axline, Wenona, Brown Leghorns; John Brey, Neola, Ia., Buff Wyandottes; Ora Ethell, Bloomington, Buff Rocks; George Eyre, of Buckley, Barred Rocks; F. H. Jackson, Rutland, bronze turkeys; J. F. Hulva, Bloomington, Minorcas; W. C. Mootier, Gibson City, Pekin ducks; Joseph Vogel, Benson, white Holland turkeys.

The annual meeting of the Arkansas State Horticultural Society will be held at Little Rock, January 30-31.

The fourteenth annual convention of the Kansas Dairymen's Association was commenced January 8 at Topeka, with an attendance of 300. The topics of the principal papers were devoted to creamery systems, methods of feeding, butter-making machinery, keeping dairy accounts and grades of milch cows best suited to Kansas herds. An interesting description of dairying in Denmark was given by A. M. Larson, of Kansas City.

A meeting of the Mississippi Valley Apple Growers' Association was held at Quincy, Ill., January 10. It was the sense of the meeting that drastic measures should be taken to exterminate all pests which had contributed largely to the recent failures of the fruit crops in that part of the country, and especially so where Illinois was affected. It was ordered that a special committee of four, consisting of Henry C. Cupp, of Fall Creek, president; James Handly, of Quincy, secretary; Homer D. Brown, of Hamilton, and C. H. Williamson, of Quincy, should be appointed to coöperate with the Illinois State Horticultural Society, and also to make special efforts in the work of securing an appropriation from the State Legislature for the purpose of providing means of eradicating all of the general orchard pests. A resolution was also adopted condemning the existence of the English sparrow, and petitioning the State Legislature to continue the standing of the statute which offers a bounty of two cents on the head of each sparrow killed.

The meeting of the Illinois State Dairymen's Association at Aurora closed January 10, the following officers being elected: President, Joseph Newman, Elgin; vice-president, J. H. Biddulph, Providence; secretary, Geo. Caven, Chicago; treasurer, H. H. Hopkins, Hinckley. Directors, Joseph Newman, John Stewart, Elburn; R. I. Murphy, Garden Plain; J. H. Buddulph, F. A. Carr, Aurora. H. Nolan, Hinckley, scored the highest on butter, 97¾. He gets $25 and a gold medal from the Elgin Board of Trade. G. Herman, Manhattan, scored second, 97½; F. E. Barrett, Union, third, 97; Otto Bloyer, Elkhorn Grove, fourth, 96¾. Two hundred and ten dollars will be divided pro rata among those who scored 93 or better. J. H. Biddulph, of Providence, Ill., scored highest on cheese.

The annual meeting of the New York State Association of County Agricultural Societies and the State Association of Union or Town Agricultural Societies was held at Albany, January 17. The organization of County Agricultural Societies elected the following officers: President, D. W. Jenkins, Central Bridge; second vice-president, Philip Keck, Johnstown; secretary, G. W. Harrison, Fort Edward; treasurer, A. E. Brown, Batavia. The Union Agricultural Societies elected president, George I. Wilber, Oneonta; vice-presidents, J. B. Wilton, Dryden; H. C. Wallace, Sandy Creek; F. A. Wickers, Hemlock; Ferris Reynolds, Walton; Delbert Dinehart, West Copake, and William Wallace, New York City; secretary, G. B. Harmon, Brockport; treasurer, D. C. Dow, Cobleskill.

As we go to press we are informed that the Grout bill will be favorably reported by the Senate Committee on Agriculture, and its success may now be considered secure.

WHAT ABOUT THE POTATO CROP?

The Commission Men Talk.

There are no potatoes in the farmers' hands in our section of the country, and very few dealers have any quantity stored. No doubt good stock will bring much better prices later. The present market of jobbers is 55 cents for good stock. PLETSCH & SUTTON.

Columbus, O.

We have been out through Ohio, Michigan and Indiana, and have had considerable talk with the farmers, and do not think that they have any large quantity of potatoes on hand. We should think that the prices would be considerably higher in the Spring than they are now.

Providence, R. I. HUMPHREY & CORNELL.

The closest estimate we have been able to make on the potato crop is that one-half of the crop is still in the hands of the grower. We do not anticipate higher prices until after March. If anything there may be a slight drop, but it will only be temporary we think.

Denver, Col. THE DONALDSON & HOWARD COM. CO.

The stock of potatoes in farmers' hands is about as usual, and we do not anticipate any high prices this Spring, unless something unusual should happen in the meantime, so that part of the crop would be destroyed. We think that the market will be liberally supplied with potatoes until the new crop comes in.

Cleveland, O. THE KELLY CO.

The larger part of the trade here had expected to see a 60 to 65-cent market here for potatoes by this time, but our local market has only reached 50 cents so far. It was pretty thoroughly understood early that the late plantings of late potatoes came out very light, but weather has been too mild to put the price where it should be. STRANGE & NOKES.

Cleveland, O.

Our impression is that about 30 per cent of the potatoes are still held by the farmer, and about 10 per cent by the potato merchant. In this part of the country the growers all have their supply in full. There are some potato merchants who carry a few carloads each, which they are holding for better prices in Spring, but it is our judgment that between 30 and 40 per cent are still held for sale. JOHN A. SALZER SEED CO.

La Crosse, Wis.

Maine had a fine crop and growers hold about one-half of them. At present they are shipping to the South and Southwest large quantities for seed, as they do every season. New Hampshire had about one-half crop, and has sold most of them. The crop of Massachusetts was small, and very few are held at present. We have received some foreign potatoes, and should the price hold to 75 to 85 cents per bushel there will be lots shipped here. LAWRENCE & CO.

Boston, Mass.

The stock of potatoes in the farmers' hands is large. The farmers are speculators this year, both on seed and table stock. The same may be said of the dealers in localities where the crop was good, but in many localities where large crop was raised in 1899, last Fall's crop was a failure, and they are shipping in potatoes from other sections where they are in larger supplies for their present use. We do not look for any higher prices in the Spring. GAMBLE-ROBINSON COM. CO.

Minneapolis, Minn.

The supply of potatoes in this market is moderate, and prices are steady for a good quality at around 50 cents per bushel. Our supplies are drawn very largely, and up to this time this season almost exclusively, from the States of Ohio, Michigan, Wisconsin and Minnesota. Ohio has become quite a potato producer, but this year the crop was much below an average, and it has been largely disposed of. In the other States named, or through the northwestern field, the crop was understood to be large, the quality up to an average, and the movement to market restricted through a scarcity of cars during the early shipping season. The quantity from this territory still to come forward is understood to be large enough to meet all demands during the remainder of the season, and the outlook does not favor advanced selling prices. SOMERS, BRO. & CO.

Pittsburg, Pa.

Notes from Potato Growers.

There is about one-half of the potato crop in the farmers' hands. J. A. THOMPSON.

Livingston Co., N. Y.

I believe about 50 per cent of the potatoes are marketed; that would leave about 50 per cent unsold. The local market to-day for general stock is 30 cents per bushel.

Mears, Mich. W. M.

I should think about 50 per cent of crop is in farmers' hands unsold. It is the opinion here that seed potatoes will be higher this Spring than last. G. B. P.

Ontario Co., N. Y.

There are few potatoes in the hands of farmers' in this county; not enough for home use. They are selling here at 60 cents per bushel, but I think seed will be $1 for common stock. T. C. HEATH.

Armstrong Co., Pa.

I do not think that there is 10 per cent of the potato crop in the hands of producers in this section. Prices of seed are 15 to 20 per cent lower than last season. Earlies will be short. GEO. H. COLVIN.

Lackawanna Co., Penn.

The potato crop throughout this county is almost all sold; very few in farmers' hands at present. I think seed potatoes will be high this Spring. It will depend largely on stock unsold in other sections. D. F. L.

Washington Co., N. Y.

One-half of the crop (which was a light one) is still on hand; those who were obliged to sell sold last Fall, and those who could hold their crop have them yet, and are holding for 60 cents per bushel. Carload price now is 50 cents per bushel. Judging by the crop of the country prices must advance before Spring. As to seed potatoes, good stock will be scarce, and will bring good prices.

Waterloo, N. Y. G. A. B.

The general impression is that there is not over 25 or 30 per cent of the potato crop held by our farmers, and this is being gradually worked off in our local market. From present conditions there will be less acreage planted the coming Spring than in the past, which was above the average. With few exceptions the crop was very light the past season. C. B.

Mercer Co., N. J.

Shipments have been liberal from all points where cars were furnished, and buyers have had more trouble in securing cars than potatoes. Where there is storage the bulk of crop in potato sections is in the hands of buyers. This is especially true of northern points, and the demand for potatoes has exceeded supply of cars at all places. I have had larger inquiry and more urgent demand for stock for immediate shipment from dealers and buyers than before in years. My opinion is that there will be an advance over present prices, and whether advance will be sharp or not will show by February.

Eaton Co., Mich. W. E. I.

From the most careful estimates, we find fully 50 per cent of this year's potato crop is marketed, in this section. Owing to the most severe drought ever experienced in this part of the country, there was not more than half an average crop. However, the stock, as a whole, is smooth and nice, with no signs of rot whatever. At this writing, the outlook is favorable for a greater demand for seed potatoes this season than last. There has been a fair demand for southern seed, which is nearly all shipped. From various indications, especially in the West, we venture to predict that the price of seed will rule higher this year than last. HILER BROTHERS.

Steuben Co., N. Y.

Good Roads in New York.

I believe if all tax assessed upon the people was paid in cash, and put into the hands of a competent man in each town, or part of town, as he might be able to oversee, and properly expended in the improvement of the roads, we would need very little increase of taxes to secure good roads. The road commissioners of each town should, on petition of the best and most responsible men of the political parties, be appointed by the county judge, very much as the wheel path commissioners are chosen. Each commissioner should be known to be a good, responsible and competent man, who would give a bond sufficient to cover double the amount of money given into his hands, and should not have too large a territory to look after. The idea is to take the selection of the road commissioners out of politics, as in many cases under the present system they are elected by the town's money, and by votes of the lowest element, those who pay no taxes, not even a poll tax.

These men many times appoint the path-masters from the same element, and this system has resulted within a few years, in two districts near my home, in not having a single man called out to work the roads. Other years money has been collected upon the assessments to the amount of $50 or $100, and to my certain knowledge only a small part of the amount expended upon the roads. Aside from that, favored ones in the district would escape either in whole or in part, the payment of their road tax. It seems to me all the legislation we need is sufficient to carry out something in line with the above, making the penalties for "crookedness" so severe that no official will dare do aught but his duty. Commissioner Todd, of the town of Eaton, Madison County, by the system of collecting the tax in cash and expending the amount under the supervision of honest men, has accomplished a grand work on the roads in his town.

Oneida Co., N. Y. J. T. THOMPSON.

Woman and Home

From Day to Day.

We don't get anything to eat at our house any more—
There's never any common dish comes through the kitchen door;
For ma and all the girls is workin' like they was machines—
A-makin' "Dainty Dishes" from the fashion magazines.

They give us dabs o' this an' that, with names we can't pronounce,
With sprigs o' stuff around them all, just like a little flounce.
A stalk or two o' spinage takes the place o' "mess o' greens"—
We're eatin' "Dainty Dishes" from the fashion magazines.

The groc'ry bill's a-hummin' now—I tell you it's a sin;
We got to buy the dainty stuff an' things to cook it in.
I'm blamed if I'll call bean soup any "consummay de beans!"
But it's in the "Dainty Dishes" in the fashion magazines.

I want a steak—I want it quick—I'm hungry as a hoss—
I want it with thick gravy—no new fangled kind o' sauce;
An' listen kerful an' you'll know jest what the ol' man means—
I want no "Dainty Dishes" from the fashion magazines.

—Baltimore American.

*

ISABELLA fox is one of this Winter's furs. It is white Alaska fox dyed a creamy tan blending into a deeper brown stripe, rather suggestive of stone marten. This latter beautiful fur is much imitated, wolverine being dyed (or blended, as furriers say) into an excellent imitation.

*

STOCK collars, or neckers, as shop slang describes them, of fine white cashmere are seen this Winter in a variety of shapes. Their advantage is that they may be washed, while more perishable materials may not. Panne makes many handsome stocks, but it is extremely perishable, not only soiling quickly, but also wearing rough. The cashmere stocks are usually trimmed with many rows of machine stitching.

*

THE editor of the Kansas City Journal says he is going to quit talking about the erudition of Boston people. One day recently a plain farmer from Smith County left off plowing long enough to come in and tell the editor that he had plowed up some crinoids belonging to the paleozoic or mesozoic age, as well as some silurian trilobites and brachiopods. That must be a university-extension farmers'-reading-course farmer. Still, hasn't a farmer a better chance to become acquainted with trilobites and brachiopods than the man who sells hardware over a city counter?

*

THERE are many things a man may do better than a woman, but dressing children is not one of them. The New York Sun illustrates this fact in the following little happening:

When they came on the car the other day everybody wondered what made the small girl look so queer. A nice-looking man was leading her by the hand, and she would have been nice-looking, too, if it hadn't been for her bonnet. It was the strangest bonnet seen in many a day. A deep and full ruffle fell into the child's eyes, while a stiff, shelf-like projection stretched out over her neck. She was uncomfortable and the man was oblivious. After a while a plump and comfortable mother of two could endure it no longer. She leaned across the car and said something to the man, who began to smile. He untied the bonnet and put it on the other side up. The ruffle developed into a little cape and the shelf into a poke bonnet, and the transformation was complete.

"You see, her mother wasn't around and I——," he began.

"Of course you did," smiled back the mother of two.

A LITTLE trifle sold at a recent fair consisted of a small vial, dressed in a quaint little silk gown, a Shaker kerchief, and a silk hood. Attached to it was a card inscribed: "What is this for? If you guessed its use you might take it; if not, you must buy it for five cents." No one ever guessed it, and

3713 Girls' Blouse Costume
4 to 12 years.

everyone wished to try, so a large number were sold. After the sale was over the purchasers were informed that the vials were for broken needles, and were to be suspended from the sewing table by a loop of ribbon. The little silk hood, which was lined with batting, was pushed back when necessary to remove the cork, and broken needles or pointless pins put into the bottle.

*

AT Cleveland, O., a fraudulent "employment agency" has been gathering in a fat living for its proprietors for several years. The law could not touch it, but it has secured plenty of money from working women, and prospered on the ill-gotten wealth obtained under promise of securing employment for its victims. Finally a young woman who had paid $2 to the "agency," in the effort to find work, took the law into her own hands. She collected 50 other women who had been similarly treated, and marched to the swindling office. The women raided the establishment, carrying off everything movable, and compelling the proprietor to flee for his life. The police declined to interfere, and the general verdict is that the swindler deserved the treatment given him.

*

LAST week Miss Anna Barrows, editor of the American Kitchen Magazine, made some suggestions concerning the farmer's bill of fare, and how to make the best of our food materials when they are restricted in variety. Miss Barrows has been speaking at farmers' institutes, and she finds the women eagerly interested in any ideas that will aid them in doing their work well, or in making the best of food materials at hand. The lack of variety in vegetables on the farm is often referred to, and is a serious disadvantage. With plenty of vegetables one can make much of limited materials, and it is a short-sighted policy which ignores the home garden. Why not consider this matter now, and decide upon a plan for the coming Spring? If the seeds are procured early so that they are on hand, and all plans laid for the garden, it is less likely to be neglected than if set about hurriedly, at the last moment.

The Rural Patterns.

The blouse in combination with a gored skirt makes a simple costume much worn and much liked by little girls. The tasteful model illustrated is made from dark red serge, with bands of black velvet edged with narrow gilt braid and a shield and collar of gilt-embroidered red panne. The skirt is cut in three pieces, the gored front and circular sides, and is joined to a body lining that is snug and closes at the center back. The shield portion is faced into the lining and the standing collar is seamed to the neck, so that all closes together. The blouse is separate, with shoulder and under-arm seams, and opens at the front, where it is provided with buttons and buttonholes. Both back and fronts are plain across the shoulders, b ι slightly full at the waist, where the blouse pouches over the belt. The right side laps over the left in double-breasted style, the rounded points being decorated with gold buttons, and the neck is finished with a deep collar that is round at the back and square at the front. The sleeves are two-seamed and nnished with turn-over flare cuffs. To cut this costume for a girl of eight years of age five yards of material 27 inches wide, 2⅜ yards 44 inches wide, or two yards 50 inches wide, with ⅜ yard 18 inches wide for shield and collar, will be required. The pattern No. 3713 is cut in sizes for girls of 4, 6, 8 and 10 years of age. Price of pattern 10 cents.

The Eton jacket illustrated shows the fashionable kaiser or military collar, now very popular. The model is made from black cheviot with self-faced revers, and collar finished on the inside with velvet and rows of narrow gold braid, and is closed by means of handsome smoked pearl buttons; but black

3715 Double Breasted Eton.
32 to 40 in. bust.

velvet, melton and beaver in brown and tan, dark blue and red are all correct for the separate wrap, and the various suiting materials are used when the jacket matches the skirt. The fronts are cut with single darts, but fit snugly to the figure. The back is seamless and finished in a rounded bat-like extension below the waist, and is joined to the fronts by wide under-arm gores that extend well back to form side backs and give a slender, tapering effect to the figure. The sleeves are two-seamed, snug, without being tight, and are cut in modified bell shape, so allowing the jacket to be slipped on and off with ease. At the neck is the military collar, with pointed ends that can be hooked over close or left free, as preferred. To cut this jacket for a woman of medium size four yards of material 21 inches wide, two yards 44 inches wide, or 1⅝ yard 50 inches wide, will be required. The pattern No. 3715 is cut in sizes for a 32, 34, 36, 38 and 40-inch bust measure; price 10 cents from this office.

Rural Recipes.

You may breathe a pious blessing
Over viands rich and good,
But a blessing with long faces
Won't assimilate your food;
While a meal of bread and herring,
With a glass of water clear,
Is a feast if it's accomp'nied
With the blessing of good cheer;
Knowing something funny, tell it;
Something sad, forget to kneil it;
Something hateful, quick dispel it,
At the table.

—Boston Bcacon.

Bacon Fraze.—Beat four eggs very light; add one-half cupful of milk, one tablespoonful of flour and one saltspoonful of pepper; lay eight or nine thin slices of bacon in a hot frying-pan; when slightly brown, turn and pour over them the prepared batter; brown on both sides and serve on a hot platter.

Poached Eggs and Celery.—Arrange carefully poached eggs neatly on rounds of hot buttered toast. Fill in the center of the dish with a pint of celery cut into inch lengths and cooked in boiling water until tender, then stirred into a cupful of cream sauce. Serve very hot.

Creamed Liver.—Cut one pound of calf's liver in inch-square pieces and cover with cold water; add one teaspoonful of lemon juice and one whole clove and simmer gently for one hour; add one-half teaspoonful of salt after half an hour; pour off water and add one-half pint of rich milk or thin cream; mix a heaping teaspoonful of flour with one tablespoonful of butter and add as soon as the milk or cream boils; add one-fourth of a teaspoonful of salt, a pinch of white pepper and let boil up once. Serve on small squares of crisp toast.

Maryland Oysters.—Sprinkle gradually three-fourths pint of Indian (corn) meal into one quart of boiling water, previously salted with a large teaspoonful of salt; allow it to boil half an hour. Drain one pint of oysters of their liquor, and stir them into the mush; allow 10 minutes longer, then pour the mixture into a square mold or a baking-powder can which has been wet in cold water. Cut in neat slices in the morning and fry.

Bird Neighbors in Elmville.

It was just 4 o'clock in the morning when Miss Clarissa Steele crept quietly downstairs and out at the side door. She stood for a moment on the broad stone step and took a long, free breath, then she went down the gravel walk and into the street. She turned away from the village, and, as if with a definite object in view, walked swiftly toward the fields and hills to the north.

It was only since April that Elmville had taken a lively interest in birds. It had known vaguely that there were birds within its borders—English sparrows, an oriole or two, and out in the country crows, perhaps a few jays. This limited ornithological knowledge had satisfied Elmville, and when it heard that in Boston it was the thing to rise early, take one's opera glass and go "birding" it had smiled indulgently. That, however, was two years ago and Elmville was 200 miles from Boston. A hundred miles a year was quite fast enough for a fad to travel toward Elmville, but when it finally arrived it was received with enthusiasm.

The little village suddenly awoke to the fact that there were birds in its trees of which it had never dreamed, and birds in its fields and pastures whose very names it had never heard. It began to talk wisely of vireos and warblers, red-starts and flickers. Quiet folk who had known of birds all their lives suddenly found themselves in great demand. This popularity might have turned their heads had it lasted long enough, but when it was discovered that there were questions which they could not answer they were promptly made to know their proper places and to feel like impostors who have been found out.

The newly-aroused interest in birds took different forms. There were some who made up parties and took long walks in the woods, where they talked and laughed so loudly that all the birds fled before them. This class enjoyed the bird walks greatly and went every week. Then there was young Mrs. Goodnow, who had seen more birds than anyone else in town, but who could not tell the song of a rose-breasted grosbeak from that of a cuckoo, declaring naively that she did not care anything about the noises the birds made. Others wondered how she could know so many birds when she did not have her ears to help her, but then she had a very fine pair of field glasses and unlimited time. There were the two elder Misses Steele, who contented themselves with looking from windows into the tops of the elm and maple trees which grew about their their home, and there was their sister Clarissa, who on this beautiful June morning, was out in the country at a little after 4 o'clock.

It was 7 o'clock when she walked up the path to the side door. She was tired and very hungry, but she was also happy and had a quantity of bird news to tell her sisters. Breakfast was ready and a delicious odor of hot coffee came out to her through the screen door, and she went in eagerly. She hung her hat in the entry, then passed on to the dining room.

Usually she greeted her sisters with a cheery good morning, but this time she had hardly crossed the threshold before she was aware that something was wrong. A quick glance at Elinor and Caroline showed her that it must be something very wrong indeed. Her heart began to beat faster and all the happiness seemed suddenly to have gone out of the morning. She looked timidly at her sisters and they stared at her in stony silence.

"What is the matter?" she asked, tremulously.

"I should not think you would need to ask that question, Clarissa Maria," Elinor said in a hollow voice.

"No, I should not think so," echoed Caroline.

Now it was only about once in three years that she did anything bad enough for them to call her Clarissa Maria, and at that moment she felt that life was too full of bitterness to be borne. She sank weakly down in a chair and waited.

"To think," began Caroline, in a tone of sadness and reproof, "to think that you should disgrace us, and not only us, but the good name of our family, by making your pretended interest in birds an excuse for going out mornings and carrying on a flirtation—"

"A scandalous flirtation," interrupted Elinor.

"Yes, a scandalous flirtation with Deacon Upton."

Clarissa started to her feet with a little cry. "I—I never did," she gasped, while the color rose in her face.

"You saw him this morning. You don't deny that, I suppose, though I don't know," and Caroline shuddered.

"Yes," said Clarissa, eagerly. "I did see him. It was down in Mr. Ames' meadow, but he was on one side of the river and I on the other, and we just stopped to speak about birds for a minute."

Elinor smiled sardonically. "And then," she said, "he kissed his hand to you—not once, but several times, and you—"

"You kissed your hand to him," finished Caroline, as Elinor paused and seemed unable to go on. "Yes, Clarissa Maria, you kissed your hand to him. We know it because Sally Porter was on the hill and heard your voices and saw you do it."

"Oh!" cried Clarissa, her face lighting up, "he did not kiss his hand to me. How could you think he would be so silly? He was just showing me how to call the birds around. You just put your fingers to your lips and make a smacking sound, so," and she illustrated, "and somehow it makes the birds come."

The elder sisters looked skeptical. "That is a very ingenious excuse," said Caroline, coldly. "And how do you explain your conduct?"

There were tears in Clarissa's eyes now. "I just tried to see if I could do it," she said, with a little sob.

"Well," said Elinor, "I don't know how many people will believe you. You know what Sally Porter is like. You'd better eat your breakfast and start right out and see and explain to all the people she has told the story to. Come sit down, things will be stone-cold."

"I—I don't want any breakfast; I'm not hungry," and Clarissa went out of the room with her handkerchief held to her eyes.

An hour later Elinor tried Clarissa's door and found it locked. "You'd better come down and eat something," she said, but there was no answer and she went away.

An hour after that she came again. This time she shook the door vigorously. "Clarissa," she called in a subdued tone, "come downstairs at once. Deacon Upton is here and wants to see you."

"Oh, I can't!" cried Clarissa, in a frightened voice.

"You must," said Elinor, emphatically. "He says he will wait any length of time but he will see you."

When Clarissa entered the parlor Deacon Upton rose to meet her.

"Good morning, Miss Steele," he said. Then both remembered that they had met before that morning and there was an awkward pause. She looked down at the carpet and he looked at her.

"I think, Miss Clarissa," he said, desperately, when the silence had become unendurable, "I think that you have heard the same thing that I have." He felt that he had expressed himself vaguely, but she understood and nodded her head without looking up. She tried to keep her lips steady, but she could not prevent the tears from coming. When the deacon saw them they seemed to give him the courage of desperation.

"I cannot express to you my regret that I was the cause—the innocent cause—of giving you pain. I would do anything in my power for the privilege of living over this morning and omitting that scene. But only on your account, remember," he went on, impetuously, "only on your account. For myself, I would not care who knew or saw. I would not be content with merely kissing my hand to you, either, and I would be willing to—er—do it on the green in front of the postoffice in sight of everybody."

Clarissa was looking at him now, and the deacon moved his chair nearer. Her eyes made him think of drowning violets, and he had a strong desire to save them.

"Clarissa," he said, "did you ever want something very, very much, but, knowing that it was far beyond your reach, after a time almost forgot that you wanted it, and deceived yourself into thinking that you were happy without it? Did you, Clarissa?"

She nodded.

"Well," he went on, "that has been my experience, and this morning something happened that brought it all back to me, and—oh, Clarissa! I don't see how I can live without you any longer."

She was silent for a moment, then she said softly, "I don't think you will have to."—Chicago Record.

Staining Floors.

There is an excellent stain for those who cannot afford hardwood floors, says a writer in the Chicago Inter-Ocean. It is inexpensive and easily cared for. First, if there are cracks between the boards they must be filled before the stain is applied. You can use putty for this purpose. The stain is linseed oil and burnt umber, in the proportion of a tablespoonful of the burnt umber to a pint of oil, or a little less oil if a lighter shade is desired. Apply with a paint brush, rubbing it in well. A second coat after 10 days will give better results. The preparation for the floor (which is very necessary) is to get it perfectly clean, so that the paint will adhere firmly and not show an uneven or clouded appearance. I always had my floor wiped up with a warm cleansing suds of pearline, as the washing powder is not so strong, and the traces of soap or lye will injure the stain that follows afterward. In wiping up the dust after staining it I used a damp cloth, or an oiled cloth. Try a little of the stain upon a piece of wood before painting the floor, so as to get the right color. An oak stain is made by mixing a pint of boiled linseed oil, a gill and a half of turpentine, three tablespoonfuls of whiting. Some prefer the oak, but I like the rich brown color of the burnt umber stain best.

I HERE part forever with all the cynical and saturnine. I do not want to live on the same street with them in Heaven. They will always be singing out of tune, and searching for fractures in the amethyst and finding fault with the country. Give them a world to themselves where they can have an eternity of pouting, a sky full of drizzle-drozzle, an owl in each tree to hoot away the hours and a kennel of snarling rat terriers to nip the robe of every angelic intruder.—Christian Herald.

are sold by jewelers everywhere in various sizes and styles, at prices to suit. Send for free booklet to the ELGIN NATIONAL WATCH CO., Elgin, Ill.

BROWN'S BRONCHIAL TROCHES

Neglect of a Cough or Sore Throat may result in an Incurable Throat Trouble or Consumption. For relief use BROWN'S BRONCHIAL TROCHES. Nothing excels this simple remedy. Sold only in boxes.

RHEUMATISM.

The Dr. Von Post great Holland remedy, "QUICK RELIEF," in capsule form, QUICKLY CURES RHEUMATISM IN ITS WORST FORMS. No free doctors No free samples. No free humbug, but an HONEST and special quick relieving remedy, as thousands will testify. Don't wait and suffer. The price is $1 per hundred, or send 25 cents in silver and get 25 capsules for trial and be convinced.

JOHN H. POST, Deep River, Conn.

"THE LIGHT THAT NEVER FAILS"

THE ANGLE LAMP ought to be in every home where good light, genuine comfort and real economy are appreciated. It is being installed all over the country in place of all other systems. More brilliant than gas or electricity; never smokes, smells, or gives any trouble; is lighted and extinguished as easily as gas, may be filled while light, and costs but 18 cents per month to burn. It proves a revelation to those who are accustomed to the smoky, ill-smelling, troublesome thing, usually called a lamp, which is no better now than it was 10 years ago. Our catalogue, N. N., tells all about this wonderful light, and shows all styles from $1.80 up. Free on request. THE ANGLE LAMP CO., 76 Park Pl., N. Y.

MARKETS.

REVIEW AND OUTLOOK.

EGGS are down three cents from last report, but with a brisk demand and advices of light receipts on the way, the market is firm.

POTATOES.—Trade is poor all around, and the market has a surplus of low-grade stock, which has to go for $1.50 or less. Prices on the better qualities are firm. Sweets and Bermudas are dull.

DRESSED POULTRY.—Receipts continue large, and dealers are complaining of dull trade, particularly on turkeys and fowls. Choice chickens are firm, a good many of the packages of poultry now coming in are showing the effects of the recent warm weather, and have to be disposed of at once.

GRAIN.—Wheat has dropped three cents. The crop in Argentina is estimated at 105,000,000 bushels, and this will allow a surplus for export of anywhere from 50,000,000 to 70,000,000 bushels. Corn is weak. There is not much activity in the oat market here, but light stocks in western markets brought up the price a trifle. Rye and barley are dull.

BUSINESS BITS.

THE Frazer axle grease is the standard axle grease of the world. Use it and save your horses and wagons. One greasing will last two weeks.

E. B. WOODWARD, 302 Greenwich street, New York, furnishes game associations with live quails and rabbits for breeding purposes. He has orders from State game commissions for a large number of live rabbits. Any who can supply them should write him for particulars.

THE Cahoon broadcast seeder has been before the farming public so long that many of our readers are familiar with its good points. It sows from six to eight acres an hour, and distributes the seed so evenly that one could say it saves its cost every hour. Write to Goodell Co., 14 Main St., Antrim, N. H., for full information.

A FIRST-CLASS poultry supply store has been established at 38 Vesey Street, New York. It is under the management of Adin G. Pierce, the well-known expert incubator operator and poultryman. The new store is owned by The Star Incubator Co., of Bound Brook, N. J., and carries a full line of Star incubators and brooders, Lincoln flint-coated roofing, Franklin lice killer, Star Specifics, bone-cutters, etc.

ANYONE interested in quick and economical farm and garden work should obtain a copy of the Iron Age Book for 1901 by writing to the Bateman Mfg. Co., Box 102, Grenloch, N. J. Improvements are shown in this catalogue in the well known standard line of "Iron Age" implements, and a number of new tools are introduced, including a combined pivot and fixed wheel riding cultivator, a combined fertilizer distributor and seed drill and a combined single wheel hoe and seed drill.

AMONG the many good machines now on the market for grinding grain for stock purposes, we know of none which stands out more prominently than the Improved Quaker City grinding mill. It is manufactured by A. W. Straub & Co., of Philadelphia, Pa., and is handled in the West by The A. W. Straub Co., of Chicago, Ill. The mills crush and grind ear corn alone, or mix other grain with it at the same time The reader will observe the double hoppers, and this is the object of their use. The reduction is very gradual, easy and thorough. Small-grain hopper is equipped with automatic Shaker feed, which insures evenness of the resulting meal or feed. They are easy to adjust and regulate, and in grinding shelled corn alone can be set so as to produce the finest family meal. Write to the nearest office for catalogue, circulars, prices, etc.

GASOLINE ENGINE.—For the past two years we have used a gasoline engine; it thrashes, shreds corn fodder, cuts and grinds feed of all kinds; in short, is used for any purpose where power is required. It is perfectly safe, no danger from fire and requires but little attention. Our engine is 4½ horse-power, but would recommend more power, whether wanted or not.
Alexander, Ark. W. S. T.

BULL-STRONG!
....PIG-TIGHT....
An Illinois farmer said that after harvest he had fully 200 bushels of loose oats on the ground that he could not secure any benefit from, because the fence around the field would not turn hogs. Figure the loss for yourself, He also said, all this would have been saved if he had used the Kitselman Woven Wire **Coiled Spring Fence**, and the value would have gone a long ways towards paying cost of the fence. With the **Duplex Machine** any farmer can make it himself at the actual cost of the wire. Catalogue free for the asking.
KITSELMAN BROS.
Box D92. Muncie, Ind.

Wants, For Sale or Exchange

FOR SALE—Traction Engines and Thrashers, 2nd hand, cheap. F. A. Booth Co., Stanley, N. Y.

Farm Managers, Gardeners, Buttermakers, etc., always on hand. No charges to employers. Write us. Rural Science Agency, Durham, N. H.

Valuable Fruit Farm and Country Home, desirably located. Bargain. F. A. CHAPMAN, City Building, Wellsburg, West Va.

FOR SALE—Farm of 247 acres, five miles from Battle Creek, Calhoun County, Mich. Good buildings, barn and improvements. H. B. McGRAW, 917 Williamson Bldg., Cleveland, O.

Wanted—Foreman for general nursery and orchard work. State age, wages, and experience with reference. Address M., Fontella, Va.

WANTED.—A horticulturist of large experience, desires to engage with a commercial orchardist or company expecting to plant largely of peach, apple, or pear. Would engage with a railroad or other corporation needing a man of this kind. SAM T. KENYON, 823 Galia St., Portsmouth, O.

For Sale—FARM. A Grand Bargain. One of the finest 160-acre farms in the State, 2 miles from Muir, and 4 miles east of Ionia. Price, $40 per acre. For further particulars address ED. B. HAMILTON, Muir, Ionia Co., Mich.

Do You Want to SELL YOUR FARM or Country Property? We will find a buyer for you no matter where located. Write description and selling price and learn our up-to-date method. NATIONAL REAL ESTATE CO., Morrison Block, ITHACA, N. Y.

GLENN RANCH,
Glenn County, California,
FOR SALE IN SUBDIVISIONS.

This famous and well-known farm, the home of the late Dr. Glenn, "the wheat king," has been surveyed and subdivided. It is offered for sale in any sized government subdivision at remarkably low prices, and in no case, it is believed, exceeding what it is assessed for County and State taxation purposes.

This great ranch of 40,000 acres runs up and down the western bank of the Sacramento River for 15 miles. It is located in a region that has never lacked an ample rainfall, and no irrigation is required.

The river is navigable at all seasons of the year, and freight and trading boats make regular trips.

The closest personal inspection of the land by proposed purchasers is invited. Parties desiring to look at the land should go to Chico, California.

For further particulars and for maps, showing the subdivisions and prices per acre, address personally or by letter,

F. C. LUSK,

Agent of N. D. Rideout, Administrator of the Estate of H. J. Glenn, of Chico, Butte County, California.

American Gardening.

Fruit and Ornamental Trees, Bulbs and Roses. Send for illustrated catalogue. WILLIAM O. SNYDER, Minersville, Pa.

Do You!

The experiment stations, agricultural colleges and many of the best students of farm subjects in the country keep their files of THE R. N.-Y. for reference. Many subscribers are now sending last year's files to us to be bound in book form and returned. This is rather expensive, yet we have no doubt that such students get the worth of their money. You may not feel like this expense, but we have a flexible binder that we could send you postpaid for 25 cents, or another stiff-board cover for 75 cents. Either will hold a full year's file. Then you can refer to any number during the year, and the index sent with the last issue of the year, enables you to refer to any article.

Have you time now to get up that club? Four names and $4 pays for your own subscription one year—the five for $4. They may be new names or renewals. Send a club of three for the 75-cent binder, or one for the 25-cent binder.

THE RURAL NEW-YORKER.

Market Briefs.

PICKED UP HERE AND THERE.

LARGE PROFITS.—A dividend of 8½ per cent has just been made to the stockholders of the North German Lloyd Steamship Company, although the company suffered a loss of $1,250,000 through the fire in their dockage at Hoboken last year. Another German line running to the Far East, has declared a dividend of 10 per cent.

DRIED CURRANTS.—Early in the season the crop in Greece promised to be unusually large, but later unfavorable weather and plant diseases cut the crop down to about one-fifth of the previous estimate. Naturally prices went up to extravagant figures, ranging at present from 9¾ cents to 11 cents wholesale. At these rates trade is light, and their place will be taken largely by other dried fruits.

BUTTER is down three cents from last week, and the drop has caused considerable activity among the buyers. Prices are now within reach of exporters, and there is a fair amount of trade in fresh creamery and June creamery for this purpose. The best creamery is scarce, but there is quite an accumulation of inferior grades. Some choice factory in small tubs is being taken by local trade at 14 cents, but there is no great demand for this.

LUMBER FIGURES.—Saginaw, Mich., lies in one of the largest lumber-producing sections in this country. The output for the past year, however, is said to be the smallest in 25 years. The entire cut of the mills for 1900 aggregates 213,000,000 feet. More than half of this was pine; about one-third hemlock, and the remainder hardwood. The largest output of shingles was 10 years ago, when nearly 305,000,000 were turned out. Last year only 11,500,000 shingles, and 28,000,000 lath were made.

SHIPBUILDING FIGURES.—Reports for the year just past show that in the yards of Great Britain, there were launched 854 vessels, aggregating 1,500,000 tons. This is an increase of nearly 100 vessels over the previous year, though the tonnage is about 20,000 tons less than for 1899, showing that during that year the average of size was somewhat greater. These represent the output of 96 shipyards in the United Kingdom. In the United States steam vessels of 144,450 horse-power were constructed, the largest output being from the Cramps, of Philadelphia.

A COLD WEATHER CRANK.—One evening during a severe cold snap, when most people felt like drawing their heads down into their coats and getting indoors as soon as possible, I heard one man saying to another on the street: "This is bracing air; just what people go to the Adirondacks for; yet now that it is right here, they stay in the house. My son has been sickly, and I took him out for a long walk this afternoon." If the son does not have pneumonia, it will not be his father's fault. Very cold air is not harmful to those accustomed to being out of doors and breathing deeply all the time; but delicate people and those spending most of their time in the house, should be cautious about breathing deeply in extremely cold air. The lungs are not accustomed to it.

MUSHROOM conditions, for any but the best, are unfavorable, and low prices prevail, some going for 10 cents per pound. This is a business that can be overdone, and there is no doubt that too many have gone into it. Comparatively few people care for mushrooms. In most cases the taste must be cultivated. Others have a prejudice against them as food on account of the fatal mistakes some have made in eating varieties that were not wholesome. A man who was considered one of the best authorities on mushrooms in this country lost his life by eating a variety which he was sure was all right. Cautious people take the ground that, if those who have made mushrooms a study for years are liable to be deceived, their only safe way is to let them entirely alone. Probably there is little danger from those sold in large markets, however, as they are raised year after year from the spawn of well-known varieties. Another reason for the low prices is the hand-to-mouth way in which they are peddled out. The majority of mushroom buyers would pay 50 cents per pound about as quickly as 25 cents, as they are usually considered luxuries rather than necessities. If growers would select a few specialists in large cities to handle their crop, instead of sending to everyone, the mushroom trade could go through regular channels, and such disastrous price-cutting be avoided. As it is, a merchant here who has nothing but a chance trade for anything in this line, receives a few baskets. None of the regular buyers come to see him, for they don't know he has them, and the quantity is too small for him to spend much time looking after a buyer. They stand around for a time until stale. Then one of those market scavengers, who is always looking after cheap stuff at cut prices, comes along; he makes an offer, and gets them for little or nothing. The same lot sent to some one who had a regular trade in mushrooms would have been disposed of quickly, reached the consumer in good shape, and brought a good price.

W. W. H.

THE EXPERIMENT STATIONS.

Boiled Bits of Bulletins.

FEEDING TRIALS.—Bulletin 45, of the North Dakota Station (Fargo), gives the result of hay and grain experiments. Brome hay (from Brome grass) gave as good results as Timothy when fed to horses. It was shown that when oat straw is fed to horses, 25 per cent more grain is needed than when good hay is fed. Barley did not give as good results as oats when fed to horses. It was shown that ear corn made an excellent grain for the working team, 77 pounds of corn giving as good results as 100 pounds of oats. Bran and shorts mixed also gave as good results as oats.

THE BROWN ROT.—In Bulletin 50, of the Georgia Station (Experiment), this disease of peaches, plums and other fruits is well described and pictured. The loss from this disease is very heavy—worse in wet seasons. It is a fungous disease and spraying with Bordeaux Mixture and destroying affected fruit seem the best preventives.

CLOVER SEED IMPURITIES.—Bulletin 47, of the Nevada Experiment Station (Reno), gives an excellent account of the impurities and adulterations found in clover seeds. Seeds of the various clovers are pictured, as are those of the weed seeds often mixed with them. It is said that little chunks of stone or pebbles are sometimes colored and sold as Red-clover seed. The bulletin tells how to test such seeds.

CRUDE PETROLEUM AND SCALE INSECTS.—Every fruit grower in the North and East will be interested in Bulletin 146, of the New Jersey Station (New Brunswick). Dr. J. B. Smith gives the known facts about petroleum as an insecticide in plain and simple language, and the whole pamphlet is worthy of careful study. We shall give a full synopsis of it later, but it would be well for fruit growers to send for a copy. We feel confident that petroleum will prove a valuable insecticide.

STRAWBERRY ROOT-LOUSE.—Bulletin 49, of the Delaware Station (Newark), describes this root louse, which has caused great damage in some parts of the South. A very interesting account of the life history of this remarkable insect is given. Ants carry the young insects about, and herd them on the roots, where they secrete a sweet substance of which the ants are very fond. Prof. Sanderson thus describes their work:

"Until the last week in April, but few ants are seen in an infested bed. About this time, however, they are quite numerous, busily carrying the young aphids from the leaves down to the roots of the plants, where are colonies of a dozen or so, rarely more than one colony upon a plant. These colonies consist entirely of young, being unaccompanied by mature females, showing that they had all been carried to the roots by the ants. The ants will be found more active in spots where the soil is dry and sandy. The ants are solely responsible for carrying the lice to the roots, as up to the time of the ants' appearance no lice are to be found on the roots. By the middle of May the work of the ants is much more evident. At that time by plunging a trowel under many of the plants, a hollow space may be felt directly beneath the crown. This space usually consist of an ants' nest, containing eggs and larvæ. Radiating from these nests, or irregularly under other plants, the ants' burrows may be found going in all directions among the roots. The ants continue to care for the aphids throughout the season. When one plant becomes overcrowded the aphids are carried to a neighboring plant, and in this way the ants are almost entirely responsible for the spread of the aphids throughout a bed as well as for carrying them to the roots of the plants."

He says that the ants carry the Corn root-louse in much the same way. Thus, old cornfields or melon fields where they have been abundant are usually full of ant hills, and strawberries planted after them are sure to suffer. Bisulphide of carbon injected into the ground near the plant will kill the lice, but the safest treatment is to clean the plants before setting. This is done by dipping them in kerosene emulsion or fumigating with cyanide of potassium. The bulletin also describes the destructive pea-louse.

Hard work does not hurt a well woman. It is the weak woman, suffering from diseases peculiar to her sex, who breaks down under the daily strain of household duties. For diseases of the delicate womanly organs Dr. Pierce's Favorite Prescription is the standard remedy. Over half a million women owe health and happiness to Dr. Pierce's treatment.

"No tongue could express the pain that I endured before I commenced taking Dr. Pierce's medicine," writes Mrs. Mollie Colgate, of Randolph, Charlotte Co., Va. "I was not able to do anything at all. Could not eat anything except bread and tea—or if I did the top of my head hurt so it seemed it would kill me; but now I can eat a little of almost anything I want and can do a good day's work as well as any body can. Am better than I have been for years. I think your medicine is the best that ever was made for it is the only thing that ever did me any good. I tried many other kinds but none did me any good but your 'Favorite Prescription' and 'Golden Medical Discovery.' I can never praise them too highly."

DR. PIERCE'S FAVORITE PRESCRIPTION MAKES WEAK WOMEN STRONG AND SICK WOMEN WELL

REBUILT MACHINERY

and SUPPLIES at Bargain Prices. Largest Machinery Depot on earth. We buy buildings and plants; among others we bought the World's Fair, the Omaha Exposition, the Chicago Post Office, and other structures. We rebuild machinery of all kinds, and sell with binding guarantees. Boilers from $25 up; Engines from $35 up; Steam Pumps from $15 up, etc. We carry complete stock of General Supplies, such as BELTING, SHAFTING, HANGERS, PULLEYS, IRON PIPE, IRON ROOFING, HARDWARE, VALVES & FITTINGS, PLUMBING MATERIAL, etc.

Live Stock and Dairy

THE BREEDERS' WAYSIDE.

Slaughterhouse Offal for Pigs.

I have had a proposition from a neighbor who runs a slaughterhouse. He slaughters about 10 animals a week. He wishes me to furnish pigs, to feed on offal; he furnishing the lumber to build the pen, and I do the work and have one-half of pork when slaughtered. How much grain would be required to keep and properly fatten four pigs in addition to slaughterhouse refuse? Would there be enough gain to pay for the labor of taking care of them? The slaughterhouse is about one-eighth of a mile from my house.

Mohegan, N. Y. F. C. C.

Now stop a bit and think! Every year animals are killed in slaughterhouses that have contagious diseases in a more or less degree. Apparently healthy-looking cattle have tuberculosis and pigs have cholera and worms of various sorts. Pigs fed offal from animals suffering from such diseases or parasites, by all probability will contract the trouble more or less. To be sure, the butcher will often say this is not so, but it is, nevertheless. Without question every day animals are being killed and consumed that are diseased. Frequently the butcher is not clever enough to notice the trouble, and then plenty of cases occur where the butcher thinks it not of enough consequence to pay any attention to them. Yet a lung may have sacs of consumption pus in it, that will not be seen, which if eaten by a pig will cause it to contract the disease. No, my friend, don't feed slaughterhouse refuse. That stuff should be cooked and made into fertilizer, but not fed to healthy pigs. If thoroughly cooked up to the boiling point for awhile, it might be fed safely, but that will not be a desirable operation for feeding purposes. Feed nice sweet grain and then your pigs, if of the right sort, will gain fast enough to pay you a profit, even if you do buy feed. But you would better let some one else go partner with the slaughterhouse and disease.

C. S PLUMB.

Pasturing Pigs on Rape.

How early in the Spring can rape be sown? What is the best variety, and how soon can it be cut or pastured for pigs in a favorable season? Do the pigs relish it at first, or do they have to acquire a taste for it? I have some purebred Poland China pigs that I wish to try on rape and a little grain. W. B. W.

Goldens Bridge, N. Y.

Rape may be sown broadcast or drilled in in the Spring, just as soon as severe frosts are over and the ground becomes suitable for working. Rape belongs to plants of the cabbage class, which are quite hardy and stand considerable frost. The past Fall we had a few rape plants on a field that had been pastured in the Summer, and they were subjected to repeated severe frosts and not affected at all. After the sun came up they looked just as bright, green and succulent as ever. Dwarf Essex rape is the standard variety, and can be depended on. Be sure to get this. Considerable Bird rape seed has been sold in this country, and this is not at all the thing, producing a plant quite unsuited to the purpose. In a favorable season on rich land perhaps rape will be fit for cutting on a small scale in six weeks or even less, just to give the pigs a taste, but two months will be better. Much, however, will depend on circumstances. Last year at Purdue we planted on April 27 and turned in pigs on the rape on June 12, which is 46 days. In my experience pigs do not take so quickly to rape as do sheep, but no difficulty, however, is met with in educating them to its use. A bunch of pigs put in a patch of rape soon learn that it is good, and act accordingly. If, however, it is cut and thrown in a pen, it will not be relished in any such way as when secured by tearing from the plant fixed in the field. The writer has fed both sheep and pigs rape as pasture and rape cut and placed in yards in which they were enclosed, and the cut rape was never eaten with the same relish as the uncut. When cut it wilts more or less, and, besides, it is easier to tear a leaf or twig from a plant firmly fixed in the ground, than it is to get mouthfuls from plants that have lost their anchorage. The only real satisfactory way to feed pigs rape is by pasturing. Turn them on to the pasture gradually, an hour the first day, longer the next, and soon they will do all right for the day. If they are put on full rape feed at once cases of bloat of a serious character may occur.

C. S. PLUMB.

Hoops on a Tub Silo.

How many hoops should be used on a tub silo 12 feet in diameter and 30 feet high? What size, and round or flat? Will it pay to apply some cheap preservative to the inside? If so, what? What would be the probable cost of the hoops?

Hamburg, N. Y. C. W. P.

A tub silo 30 feet high should have seven hoops. The first hoop at the bottom should be about one foot from the base; the next hoop three feet higher, then the spaces between hoops may be 3½ feet, four feet, 4½ feet and five feet. Hoops should be of ⅝-inch round steel or iron. We would not recommend any preservative whatever. If any is used it may be hot coal tar. The hoops will probably cost about five cents per foot.

L. A. C.

"Animal" Incubators

We have printed some strange reports about natural and unnatural incubators. Last year a thrifty woman claimed that she used her consumptive husband to hatch out a setting of eggs. The poor man was too sick to get out of bed, and his temperature was unnaturally high. The eggs were packed close up to him in the bed and, in due time they hatched, thus saving the cost of an incubator! The latest, however, is found in the following newspaper statement:

MARTINSVILLE, Ind., December 27.—John McDonald, three miles south of Mahalasville, has on his premises 12 stands of bees. The tops of the beehives are so constructed that they receive the proper amount of heat for incubators. These tops are filled with eggs and all that is to be done is to see that the eggs are turned in order to have a fine brood of chicks. He experimented last season with good success, and this year has his hives made about two feet square, so that more eggs can be accommodated, and is going into the business on a large scale. It is claimed, and has been satisfactorily demonstrated by Mr. McDonald, that bees furnish exactly the required amount of heat for the hatching of the eggs.

USING INCUBATORS.—I have used an incubator seven years, and would not like to go back to the old way of hatching with hens. I think if the chicks hatch out on time, as they should if the incubator has been run properly, they are just as strong as when hatched by hens. If there are any weak ones you are more likely to raise them with a brooder, as hens are liable to kill them in the nest. To beginners I will say that they cannot expect to do more with an incubator than with hens. Eggs that will not hatch well under hens will not do so in an incubator. I would study the directions sent with the machine very thoroughly, and follow them as nearly as possible; at the same time I would set some hens to hatch chicks at the same time as the incubator, thereby testing the eggs, and the incubator should hatch accordingly. MRS. J. A. S.

A COW REPORT.—Here is a report of eight cows from January 1, 1900, to January 1, 1901. Two of these are heifers; came in about May 1, 1900. Amount sold from said cows:

2,399 pounds butter	$608.51
Calves	17.34
730 quarts milk, 5 cents qt	36.50
25 quarts cream, at 25 cents	6.25
Manure, 70 loads	35.00
Total	$703.60
Cost of feeding:	
Grain	$160.00
Cornstalks	40.00
7 tons corn fodder	35.00
4 tons hay, $12 per ton	48.00
Salt	.50
Total	$283.50
Profit	$420.10

I think the skim-milk will pay for the work. J. K. L.

Elnora, N. Y.

Ailing Animals.

ANSWERS BY DR. F. L. KILBORNE.

Curb Swelling on Horse.

I have a mare seven years old, weighing about 1,400 pounds, that has a bunch on the curb joint, about the size of a hen's egg, cut into in the middle lengthways, and it is quite soft. She is not lame. What treatment is required? C. C. C.

Potter Co., Pa.

Blister with following ointment: Cerate of cartharides ointment, one ounce; biniodide of mercury, one dram, mix. Repeat the blistering two or three times, if necessary, applying a new blister after the scabs from the previous blister have been entirely shed. Do not apply any wash or grease to the blistered surface, but simply allow the scabs to form and shed naturally.

Poll Evil in Horse Cured With Salt.

A neighbor had a horse with poll evil. He tried medicine at $1 a bottle, and it got worse. A friend advised the use of common fine salt, worked down in the tumor or sore. The result is that the horse is cured. I see the animal every day, so know it is a fact. C. S. L.

Oronogo, Mo.

It is quite possible that this case of poll evil may have been cured by the use of common salt. There are a great number of remedies that are reported to have cured poll evil or fistula at some time or another, and yet but very few of them have proved reliable in the treatment of poll evil. Salt might prove effectual in an exceptionally mild case, but in most cases it would undoubtedly prove to be too mild in its action. Very much more depends upon the *method* of using the remedy, than upon the remedy itself.

Horses with Sore or Scabby Lips.

Three of our horses and many of our neighbors' horses are troubled with sore lips. Small scabby sores form as large as a cent, and the horse stops thriving; appetite is good. R. D. B.

Cottons, N. Y.

This affection, which appears occasionally both in horses and cattle, is due to some unknown cause. It does not appear to be contagious, but rather due to some climatic condition, or to something in the feed. Sponge the lips two or three times daily, preferably after eating, with a solution of borax or chlorate of potash. If there are raw sores or ulcers, touch them with a camel's-hair brush dipped in a solution of 10 grains nitrate of silver in an ounce of soft water. Keep the solution in a well-stoppered bottle, and in the dark. Feed on a soft, laxative diet, such as bran mashes, boiled flaxseed gruels or roots sufficient to keep the bowels moving freely. If there is constipation give pint doses raw linseed oil daily until relieved.

Chronic Cough in a Horse.

I have a horse seven years old that has a cough of about two years standing; it is not very hard or very frequent. Sometimes I notice him cough two or three times a day; some days not at all. He looks well and feeds well; give 10 to 12 quarts of oats per day, and about 18 pounds of good hay. He had a light attack of inflammation of the lungs two years ago. His wind is perfectly good; had him examined by veterinary, who calls it a chronic cough, and said he needed physic, but as he is working every day I could not give that, so he gave me salicylic acid to give a tablespoonful every morning. I have given him three doses, but have no confidence in it, as a veterinary work I have says it is used for rheumatism. What I am afraid of is that the cough may run into heaves if not stopped. The veterinarian said that there was nothing wrong with the horse's lungs. I had one horse get the heaves from a neglected cough, and do not wish to have another the same. The last-mentioned horse is being treated with arsenic. The veterinary claims that by constant use of it the horse will not show the heaves at all; is that so? F. P. R.

St. Sophie, Quebec.

Give a small teaspoonful of following cough paste three or four times daily: Powdered opium and solid extract of belladonna, of each one ounce; nitrate of potash, four ounces; powdered extract of licorice, eight ounces; strained honey (about eight ounces), sufficient to form a thick paste; mix. Administer after eating, by rubbing on back teeth and tongue with a paddle. If there is a nasal discharge at any time, or a discharge when coughing, steam the head for 15 to 20 minutes daily, at night. This is easily done by cutting the bottom from an old flour sack, placing one end of the sack over a bucket of boiling water, and the other end over the horse's nose. Add a tablespoonful turpentine or pine tar to the boiling water just before steaming. Rub the throat from ear to ear with ammonia liniment, sufficient to blister quite severely, and repeat monthly for two, three or four months, as may be necessary. If there is no improvement after four to six weeks' treatment, try a course of arsenic. Give one large tablespoonful Fowler's solution of arsenic once daily in the feed for three to five days, after which increase the dose to two tablespoonfuls once daily, and continue for a month longer. Arsenic will relieve most cases of the heaves; and in cases not too chronic or far advanced it will sometimes help the animal so that it will show no symptoms of the disease. But when thus relieved, the symptoms will reappear as soon as the animal is improperly used or improperly fed and watered. Arsenic will relieve but not cure the disease.

Worms in Horses; Contagious Distemper in Cats.

What remedies are advised for blackheaded white worms in horse? What treatment for sore eyes, sneezing and discharge from nostrils in cats? It is contagious, as kittens get it, and only live to be a few months old. How treat the mange and worms in cats? I find a sure cure for lice on cats, as I cured four after trying tobacco, insect powders and sulphur. Dissolve one-quarter pound of hard soap, Ivory or other, dissolve in two quarts of water, add one pint of kerosene oil and pump the mixture back into itself while hot; this is diluted with twice its bulk of water before use, and used while warm. Put in tub, hold animal in, and wet hair through to the skin; do not get it in their eyes. It takes off lice and leaves the animal's hair soft and clean; is good for all hairy animals.

Grand Rapids, Mich. S. J. P.

Oil of turpentine is one of the most effectual remedies for intestinal worms both in the horse and cat. For the horse, give two to three ounces turpentine well shaken up in a pint of raw linseed oil and a quart of milk. For the cat, one-half teaspoonful in two or three spoonfuls of milk. The turpentine is most effective when given on an empty stomach after a fast of at least 12 hours, and followed in two or three hours by an active physic (one ounce best aloes and ginger for the horse, and a large teaspoonful castor oil for the cat.) The kerosene emulsion is a very effective lice eradicator on any animal. It can also be used to advantage on the mangy cats. For the distemper in the cats, steam the head two or three times daily, over boiling water, to which has been added a few drops of carbolic acid. Internally, give 10 to 15 drops three or four times daily, of a mixture of an ounce each compound tinctures of cinchona and gentian. Feed mainly on a bread and milk diet. If there is constipation give a teaspoonful castor oil. A warm comfortable bed, and pure air are very essential.

Poultry Show at the American Institute

A poultry show and meeting of the Farmers' Club of the American Institute was held at the Berkeley Lyceum Building, New York City, January 9. The exhibit of fowls and appliances was very limited, but the quality was excellent. Competition with the many local exhibitions held at this season tended to reduce the number of exhibitors. In the discussion brought out by the addresses the following points were made: The most profitable flocks do not exceed 25 to 30 fowls. With extra care 50 can be kept together with good results. One successful poultry farm was described where 2,000 White Leghorn fowls were profitably kept in flocks of 40 to 50. The owner and a helper do the work, and are kept pretty busy. Long houses, 12 to 14 feet wide, are excellent, but every second partition should be solid, in order to limit disease and parasites. Hens should each earn $1 per year over all expenses, and under favorable conditions they can return a profit of $2. Light well-drained soils are always best for poultry. Heavy clay and all damp soils are really unfit for poultry runs, but can be improved by frequent spading or plowing. Use plenty of whitewash about the coops, containing a good per cent of carbolic acid. All perches should be sprayed or washed with kerosene at intervals of two weeks or oftener. Poultry work is monotonous to those who have no love for chickens. The capacity of manufactured brooders is generally much over-estimated. It is dangerous to crowd too many young chickens in them. There should be a circulation of air under the hover, and no corners for the chickens to pile up in. There is an immense aggregate value in the myriads of small well-kept flocks scattered over the country, but large flocks do not always pay so well. It is best to start in a small way and build up gradually. Birds for exhibition are best raised by hens, as it is Nature's method. Incubator fowls are just as good for layers and market purposes. Hens like pursiane, plantains and ragweed; grass and clover are the best green feeds. W. V. F.

Here's Good Potato Planting

Farmers find that the Improved-Robbins Potato Planter does good work quickly. Here is the sort of praise we are getting from all sections:

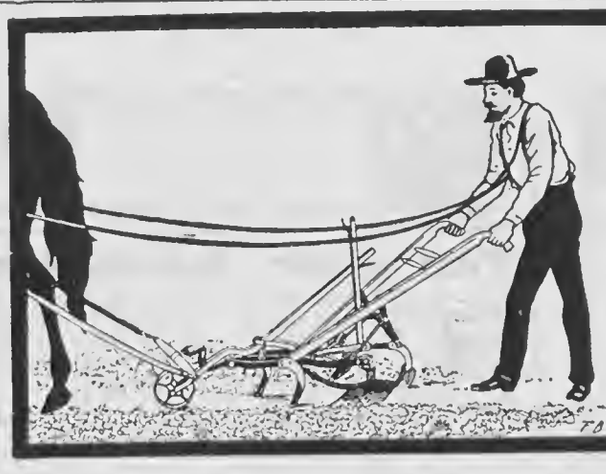
"My potato crop of 1900, planted with your celebrated Improved-Robbins Potato Planter, is turning out the best I ever raised. It is a truly wonderful machine, and yet so simple. No potato grower should attempt to do without it. I finished my planting on July 3 and my potatoes are fine." OLIVER D. P. CHAPIN, Jefferson, Wis., Nov. 6, 1900.

"The Improved-Robbins Potato Planter I bought of you last year did the work in one day that usually takes me six or seven days, and at the close of this season will not only have paid for itself, but a dividend in addition."
SAMUEL L. PIERCE, South Britain, Conn., April 22, 1900.

"The Potato Planter is a perfect tool. It does its work extra. I planted sixteen acres of my own and about all my neighbors' potatoes." MICHAEL LONG, Ada, Hardin Co., Ohio, July 13, 1900.

For the **Iron Age Book for 1901**, describing the planter in full, address

BATEMAN MFG. CO., Box 102, Grenloch, N. J.



"Planet Jr." Or[illegible] Horse Tools

embody in their design and construction the same superiority characteristic of the general *"Planet Jr." Line.* This results from a thorough knowledge of both farming and manufacturing. [illegible] the original iron frame hoe, and is today, as it was at first, the leading horse hoe [illegible] the world. Suited, with its numerous attachments, to every variety of cultivation in all kinds of soil. *The wheel lever* controls the wheel and the depth regulator perfectly. Cultivates deep or shallow, and evenly so, at will of operator. *The expanding lever* controls width of cultivation—wide or narrow at will. Made the best that such a tool can be made throughout.

It is fully described in our new 1901 catalogue, the best and handsomest we have ever published, of which we have printed 350,000 copies. Illustrated with many full page photographic pictures showing the tools at work all over the world. It tells also about "Planet Jr." Hill and Drill Seeders, Single and Double Wheel Hoes, Two-Horse Cultivators, Orchard and Universal Cultivators, Four Row Beet Seeders and Cultivators, &c. Ask for one. We mail them free. Prices for 1901 greatly reduced.

A COUNCIL OF PEACH KINGS.

THREE VIEWS OF A MOUNTAIN PEACH.

An Attempt at Mind Reading.

In recent issues of THE R. N.-Y. I tried to give some idea of the coming importance of the mountains of Maryland and West Virginia as a peach-growing section. The fruit produced on the mountains is not as large as that in some highly-cultivated orchards, but it is remarkably firm and highly colored, and delicious in quality. During our visit to the orchard of E. A. Pry—which, by the way, overlooks the battlefield of Antietam—our party missed J. H. Hale and Roland Morrill. They were finally discovered in a corner behind the packing shed under the hypnotizing influence (and camera) of George O. Brown, of the Baltimore Sun. I feel sure that R. N.-Y. readers will be interested in the picture. Here are three "captains of industry"—men who have "done something"—who will be gratefully remembered by those who follow them. At the right sits Mr. Pry. He is the only fleshy man I saw among those mountains. Mr. Pry has changed a mountain wilderness into a profitable peach orchard. We happened to catch him in his working clothes. The others wear their Sunday-go-to-meeting togs, but they are quite able to shed their soft raiment if necessary and hustle with peaches. In the center stands J. H. Hale, of Connecticut—a familiar figure to many of our readers. What a living example of hustle and grit, bull-dog courage and nervous energy! Whipped a dozen times, in the opinion of everyone except himself, he has made his way to the front with the largest bearing peach orchards in the world. At the left is Roland Morrill, still another type of man. He has dug his way up from poverty slowly, powerfully; led by a sublime faith in the final success of one who will do his work thoroughly and well. They may well be called "peach kings." Pry has conquered a mountain wilderness, and Hale has mastered a New England pasture and an old Georgia cotton plantation. Morrill has worked on high-priced land, and made his peach trees pay higher rent than human tenants could. Surely men who master the forces of nature in this way are the true kings for America.

Here are three distinct types of men—each a master in the art of peach-growing! Could we but read their thoughts as they sit there facing the sun of that crisp September day, what a story we would have! The face mirrors the mind, and perhaps we can tell from the expression of these men what their thoughts are. Mr. Morrill holds a mountain peach—a fruit that is destined to change the markets of a continent. Mr. Pry is watching it with confidence, affection and pride.

"There it is," he is saying silently, "you can see how cheaply we produce it, how fine and firm it is, how safe we are from frosts up here, and you know the vast tracts suited to peach culture. What about it?"

Mr. Morrill, the thorough, careful cultivator, knows these things and has weighed them well. These thoughts are in his mind: "I can grow larger peaches which will sell for twice the price of this, and yet this means real competition in the markets of the country. This is the peach for the million. I can only compete with it by using the most thorough culture and care. When these mountain ranges are turned into orchards the flood of peaches rolling down these hills will sweep away the careless men who are satisfied to stop short of the best!"

Hale, the optimist, has flashed the situation through his keen brain. His story is told in his face: "Yes, that is a beautiful peach—cheaply grown with unlimited chance for development. Yet we can grow just as good peaches on the New England hills, where we are within driving distance of the best markets of the country. These hills are too far back from the railroad. The long haul over these mountain roads will cost too much. Very nice! Very nice! But New England peaches are just as good and nearer market!"

So the three men are thinking out their great problems as they sit in the sun. It is truly a council of peach kings. H. W. C.

Mr. Stringfellow Prunes the Poet.

The recent poetical criticism of my methods (page 24) was so entertaining that I hope the author will give us another effusion, and take for his subject the mammoth peach tree alluded to in THE R. N.-Y. some time ago. I will refresh his memory by giving the main points. It is 27 years old, two feet in diameter, stands in a yard midway between house and barn, and has never been cultivated so far as known. It has never missed a crop of fine peaches, is healthy and vigorous, and good for many years to come, though never irrigated by anybody's sweat and has never caused anybody to "hustle and jump," or "kick dust through the long Summer day." He might incidentally bring in the fact that nobody has yet claimed the $25 I offered for pointing out, anywhere in the United States, its equal in size and productiveness, grown by the expensive and laborious methods he so wittily advocates. This tree was grown strictly according to the Stringfellow m thod, except the fertilizing and mowing, and as the laws of Nature are uniform, like results following like causes and conditions, I leave it to your readers to choose between my natural and lazy method, as demonstrated by this peach tree and thousands of other chance seedlings over the country, and his unnatural and expensive method, which never gives more than one good crop in three years, and kills the orchard in 10 years or less time. But remember, I have nowhere advised the neglect he satirizes. Short roots set in firm ground, clean, shallow culture for several feet around the trees, with heavy fertilizing of this circle, and several mowings of the middles during the growing season, leaving clippings on the ground, constitute the Stringfellow method, so-called. If the poet wishes proof of the results obtained by me through this method, if he will write to J. C. Glover, station agent at Hitchcock, Texas, he will learn that I grew heavy crops of pears every year, and in 1894 shipped 10,000 bushels from 1,500 10-year trees, and then sold the orchard for $20,000.

H. M. STRINGFELLOW.

R. N.-Y.—Brother Stringfellow should remember that poets are accorded considerable license in their efforts to make ideas measure and rhyme. We regret to say that figures and facts often give the poet mental dyspepsia. The best theme for a poet in connection with the Stringfellow method would seem to be the fact that so much hustle and cultivation robs both trees and men of the calm and satisfactory maturity which natural conditions alone can provide. Mr. Stringfellow's orchard is a strong indorsement of his system of planting.

An Experiment in Turf Culture.

I have no doubt that the Stringfellow method of planting trees would be a success, even in turf culture, if the supply of moisture could be kept up during the entire growing season to the amount that we find in the land in the Spring, or when the land is frequently cultivated, but if it is covered with grass, and no mulch is used about the young small trees, the growth will be very small indeed. My experiments, to which you refer, were not at all like the Stringfellow method, though I did plant in turf land. I started out with the proposition that there are in Massachusetts tens of thousands of acres, of little value for other purposes, upon which we find apple trees growing, and where this land is rich and naturally moist, or where an abundance of fertilizer is applied or dropped by numerous cattle in search of the fruit, the trees grow vigorously, live a long time, and produce large crops of highly-colored fruit that is of the best quality, and keeps well, and that we should utilize this land, which may be bought at from $2 to $20 per acre. Such sections of the State as the hills of Franklin and Hampshire counties are noted for their apples, of fine flavor and keeping qualities, and such fine orchards as those of Dr. Jabez Fisher, of Fitchburg; Jonathan Eames, of Sherborn, and Moses Palmer, of Groton are illustrations of success in growing apples in turf culture. This experiment was quite extensive (over 30 acres), including not only the apple, but the pear, peach, plum, cherry and grape, and while the results have not been entirely satisfactory, they have been as good as I could expect, owing to conditions that I could not control, i. e., to my distance from the work (60 miles), and too small a capital. Mr. Kinney, of Worcester, has summed up the situation with the expression, "fishing with too long a pole." The apple, pear and cherry trees have made a good, though not large, growth; the plums have been a total failure, and the grapes only a partial success.

Among the objections to this method of turf culture is the large number of borers. Both the round-headed and flat-headed borers attack the young trees. Other insects and fungous pests are not more numerous than in cultivated land. Woodchucks do much harm to young trees, and in very dry seasons the

A COUNCIL OF PEACH KINGS—MORRILL, HALE AND PRY. FIG. 27.

growth is much less than it would be in thoroughly cultivated land, but this last condition may be more or less overcome by cutting the grass and undergrowth several times, during the early part of the Summer; this may be done very cheaply with a mowing machine if the land is not very rocky. The advantages are the very low cost of the land, and the trees can be trained very close to the ground, so that thinning, spraying and harvesting can be done at a much less cost than with trees trained high enough to cultivate under. After an experience in growing the large fruits for nearly 40 years, under a great variety of conditions, and having seen many of the large orchards and fruit-growing sections of the country, I have no doubt but that more profit can be made from an orchard in strong land thoroughly cultivated from the start, that it will make a larger growth, come into bearing earlier and produce more and larger fruit than under turf culture, unless, under the latter condition, the land is strong and moist, and much more fertilizer is used than upon that under cultivation. The extra cost of cultivation, however, will largely offset this extra cost of fertilizer.

On hillsides, or sloping land that washes badly, I have found just as good results obtained by cultivating strips from six to 10 feet wide between the rows of trees as when the whole surface has been cultivated. I am inclined to look with favor upon the Stringfellow method of pruning for small trees from ⅜ to ½ inch in diameter for planting; cutting back the root severely and the top to a stub, or quite down to the ground. With peaches especially, I feel sure that better trees will be produced from a single shoot coming from near the ground than from one or more branches starting out on a stock two or three feet from the ground, and perhaps this may apply to the other large fruits, but not to the cherry. S. G. MAYNARD.

Mass. Agl. College.

R. N.-Y.—In asking northern fruit growers for an opinion regarding the Stringfellow method of planting fruit trees we have been told repeatedly of an experiment tried by Prof. S. T. Maynard, of Massachusetts. In order to put the facts before our readers we have asked Prof. Maynard for a statement, which he gives above.

THE PROPER CONDITIONS FOR CURRANTS

The Hillside Beats the Valley.

FAILURE IN THE VALLEY.—We do not claim to be experts in currant culture; however, we grow lots of them and can tell how we do it. We live in a valley, through which winds a small creek; grand land for wheat and corn, worth $100 per acre for such purposes. Here it was we began growing fruit, without experience. We planted a general line of small fruits, but will dwell on this only so far as it touches on the currant. We planted an assortment of varieties including Fay, North Star, Wilder, White Grape, Pomona, Red Dutch, Versailles, Victoria, Cherry and Lee's Prolific. At two years old we had a magnificent growth of wood, and everything looked encouraging for a great crop of fruit. After blooming freely we began to notice that the bloom was setting but little fruit, and the bunches were very imperfect; many having only a few scattering berries. This was a great disappointment, and we were unable to account for it; however, we expected that the next year the plants would redeem themselves, but not so, for year after year we experienced much the same results This lowered our enthusiasm considerably, and we finally had to abandon the enterprise entirely, cut down our bushes even with the ground, and used the plantation as a stool bed for growing currant cuttings, each year cutting the young growth even with the ground for propagating wood. We attributed our failure to late frosts and cold winds, which affected the tender bloom of the currants, located as we were in the valley, susceptible to frosts that bloom on the higher ground would have escaped.

A HILL FARM.—Looking southward across the valley, just one mile from our home, is located a farm on a very sharp elevation, towering high above the valley and surrounding farms. The nature of this soil too is altogether different from that of the valley. This farm was at that time not considered an extra good one, as farm land generally was valued in the community. The soil is red clay and gravel loam, with several of the fields on the south approaching a white clay. The owner of this farm was doing a little work with small fruits; had planted a few acres at about the same time that we began, and among other things he had a small plantation of Cherry, Fay and Red Dutch currants. Those bushes did not receive the attention that we gave ours, and in a few years they even stood in a stiff Blue-grass sod; yet they bore fruit year after year even in this neglected condition. The bunches were filled with berries to the tip ends, and showed no sign of the trouble we experienced. There were many things about that little currant plantation that were of interest to us, and we watched it closely. A frost that would knock us out entirely in the valley would do but little or no damage on the elevation. This man seldom failed to grow a crop of fruit, and his wagons went to market day after day with loads of fruit when he often had absolutely no competition. The owner of this farm gave us a special invitation to come over and see his fruit. After showing us around carefully over the entire farm of 144 acres, to our surprise he announced that he was going to sell the farm. We bought it then and there; mortgaged to the last dollar everything we owned to make first payment. Perhaps this was not a wise course. We would not advise anyone to do it; yet we

FARMER WILSON (of the Agricultural Department): "Why, you never saw a 'gold brick' shaped like this!"

PLAIN HOER AND SOWER: "No, that's a fact, Mr. Secretary. But all the same that's just what it is—'a gold brick.'"

—PHILADELPHIA RECORD.

wanted that farm to grow fruit upon. We knew its value for this purpose.

CURRANTS AND TREES.—No sooner was the deed transferred than we began plowing and preparing to plant fruit of all kinds. Now it was that the desire again to grow currants came back, and there was no use putting it down. We plowed in December 10 acres of clover sod on the highest point of the farm, and planted in early Spring, and this time we did grow currants, and see no reason why we will not continue to grow them there for years to come. With practically the same varieties and culture as we gave the former plants with no results, we now are able to grow about 150 to 200 bushels per acre. In making this last plantation we have endeavored to make the

PROF. EDWARD B. VOORHEES. FIG. 29.

conditions as near the ideal for the currant as we could. The currant is a fruit that requires partial shade and a cool moist soil for its roots. Can you not remember currant bushes standing along some neglected garden wall or fence, that year after year produced a crop of fruit, untrimmed, uncared for and neglected, yet it bore abundantly? The fence held the moisture and broke the direct rays of the sun; kept the roots cool and furnished sufficient fertility for growth. With these facts in mind we planted our commercial currant plantation. To give them partial shade we planted cherry trees 30 feet apart each way, planting in the currant rows so as not to interfere with cultivation. The currants are planted six feet one way and three feet the other, in check rows, so we can cultivate both ways and reduce hand labor to the minimum. These trees not only furnish the desired amount of shade, but are a great protection against cold winds and late frosts. They check the drying winds of Summer, which so rapidly drink up the surface water in the soil. We are aware that the trees require for their growth both fertility and moisture, and must draw from the same source as the currants, yet we are positive that the great good they do more than outweighs the evil. Notwithstanding the advice from high authority not to plant trees among small fruits, with us we will continue to do it so long as we get the results we now do.

ESSENTIAL POINTS.—We trim our plants so as to keep an open head, and the bush symmetrical in form. For fertilizers we use good stable manure spread evenly over the surface, with an occasional dressing of wood ashes. In these shaded orchards our pickers delight to work. We allow each one a small box to sit on, with a carrier holding 69 baskets for their fruit. After a hard morning's work in the hot sun gathering strawberries or raspberries, such a change is a delightful rest to them. The three essential points successfully to grow the currant as our experience presents to us, are elevation to avoid frosts in Spring. partial shade, and a cool moist soil. Varieties of course must be governed by the markets, as some markets want the larger currants, as Fay, Cherry and Red Cross, while in other markets the smaller varieties sell as well as the larger ones, and produce much larger quantities per acre. It has been an interesting study to us to watch the behavior of plants on these two farms. Not only in currants, but in other small fruits as well. Some of our most profitable varieties on the Hill Farm are failures in the valley, and many varieties that do not do so well on the heavy clay thrive and are profitable in the lighter and warmer soil of the valley. W. N. SCARFF.

Ohio.

A PRACTICAL SCIENTIST.

We are glad to show our readers in Fig. 29 the picture of a man who combines in a high degree the qualities of the skilled scientist and the practical farmer. Prof. E. B. Voorhees is the director of the New Jersey Experiment Station, and has just been elected president of the Board of Agriculture—the famous farmers' association of his State. Prof. Voorhees is a Jerseyman by birth and education. A farmer's boy to begin with, he was educated at Rutgers College at New Brunswick, where the Station is located. He is by profession and education a chemist, yet both laboratory and farm at the Station show how science has been made "soluble" and brought into those common farm operations which are familiar to farmers. For example, a first-class herd of dairy cows supply milk which is sold at retail in the city of New Brunswick. The problems involved in feeding, milking and caring for the milk provide the opportunity for scientific investigations which are of great value. Prof. Voorhees has demonstrated on this farm of 70 acres the great possibilities of feeding large numbers of cattle on a limited area by growing a succession of crops on the soiling system. Here one may see large fields of Alfalfa, cow peas, oats and peas, corn and other fodder crops following one another in a complete round of feeding. This succession of fodder crops is so successful and complete that THE R. N.-Y. expects to report it this year, and follow it through the season from early rye to late Crimson clover. Prof. Voorhees has been remarkably successful in filling the Station with strong men. It is probably the strongest collection of practical scientists to be found at any station in the country. Naturally we are glad to show our readers the face of such a man, for he who organizes on permanent lines an institution like the New Jersey Station deserves well of his fellowmen.

Wanted! Plant Medicine in Small Packages.

I wish to follow up your answer to T. C. C. in December 8 issue. I find one great trouble in using Bordeaux and other insecticide solutions, is in their preparation. It seems that those to whom we look for information and instruction along this line go upon the theory that these preparations are only for professional fruit growers and gardeners. I used last year a preparation of Bordeaux put up in one pound cartons, and with good success, except in its preparation for immediate use. The one pound was to make a solution of 50 gallons, and with the few vines and fruits that I desired to spray I did not care to use more than from five to 10 gallons at a time. I undertook to divide the packages, but I found it unsatisfactory. What I want to say is that if the preparation could be put up in doses or one-eighth, one-fourth or one-half pound, etc., or in bottle solutions to mix with five, 10 or 15 gallons of water for immediate use, it would go a long way, in satisfying and accommodating the amateur, and those who have a few vines and trees for family use. You see, when it comes to dissolving six pounds of copper sulphate in so much water, and six pounds of lime in so much water, and the two to 50 gallons of water, unless a fellow is an expert, and fully prepared for it, he is downed on the first round. I know, of course, the cost of preparations as I suggest would be more than otherwise, but it would greatly simplify the use of them, and I believe with as good results.

Indiana. W. S. Y.

The above suggestions concerning the trouble and loss in handling liquid fungicides in small quantities by amateurs and home gardeners are worthy of careful attention from manufacturers. The increasing necessity for their use is evident to all, but the trouble of making up small quantities of the solution is so great in proportion to the visible good they do that the operator soon grows disgusted. Dry preparations, such as Leggett's Fungiroid, are excellent in their way, but do not replace fresh Bordeaux Mixture in effectiveness. If some one will place a concentrated mixture on the market in quantities sufficient to make up five to 10 gallons ready for spraying, it is quite certain to meet a welcome from amateurs and small growers.

A SERMON ON THE SHORT-HORN.

"Like Produces Like."

FIXED TYPES.—In studying animal development and the various influences and effects of breeding, no law became more closely demonstrated to early breeders than the one that "like produces like." Bakewell 125 years ago demonstrated this law to his satisfaction, and ever since then thinking breeders, in season and out, have been impressed with its truth. In fact, in a general way we all of us are impressed with it, whether stockmen or not. Friends call to see the new baby, and "How he does resemble his father," is a common expression. You meet Calvin's 18-year-old son for the first time, and at once you begin to search for resemblances. That is simply illustrative of the habits of people. We institute comparisons, and first of all in family relationship. We naturally expect, "like father, like son," and the same application comes in with farm animals. Circumstances, however, affect cases. If you will stop to consider a minute, you will be impressed with the fact that with wild animals the type is very fixed. Red foxes vary but little in type and description; only in minor things. The same applies to partridges, red deer, crows, prairie dogs, black bears or anything else. In fact, these wild things breed so uniformly alike that scientists have been able to classify them so accurately that no matter where found, by the aid of a printed description, they are able to determine them if they perchance have not seen them before. An American robin by accident found in central Russia, is determined with ease by a Russian ornithologist, who has access to descriptive works on ornithology, though never having seen it before. To what is this due? To the fact that wild things have reproduced themselves from generation to generation under very similar condition, and so have highly intensified uniform breeding. Prepotency is the power of an animal to stamp or impress its character in a high degree in its offspring, and in wild animals prepotency has it highest average development. Foods, mating and climate are less variable with the wild beasts than the domesticated, and they are accordingly more uniform in type.

WHEN MAN CONTROLS.—With domesticated animals we have a different condition. Man usually mates the sexes, attends to the feeding and controls the other conditions of life to a large degree. Animals of widely different temperaments, or of different constitutional forces are perhaps mated. Opposites, or positive and negative are joined, and the result is uncertainty. Well-established forces in one generation become unsettled in a second, while a third makes a bad matter worse, for here is where the bad results of cross-breeding most often show themselves. Now I have jumped from the one extreme to the other, from the well established uniform type, to the indefinite, hit-or-miss type. What I wish to impress is this: Nearly all of the breeds of to-day are the results of long persistent breeding, in which opposites perhaps have played their part, but where a master hand and mind has also played his. Certain things were sought for, and other things denied. The noble Short-horn is the result of what history tells us is a combination of the cattle along the River Tees, in Yorkshire, with some Dutch blood from across the Channel, and probably something else. But the Collings and Bates and Booth and Cruikshank worked without ceasing to develop a breed type that should be prepotent and uniform. And so for over a century during the generations, some men have sought to produce Short-horns that would come up to their ideals. These ideals had much in common. All the great breeders have sought for superior constitution, rapid growth, a maximum of desirable meat and a minimum of offal. Broad backs, deep well-sprung ribs, square bodies well covered with flesh, hard fine bone, great feeding capacity, placid temperament—these all men unite on as desirable and all-important. The more men have succeeded in breeding such a type, the more carefully this has been attended to from generation to generation, the more uniform have been the results. And so by casting aside undesirable animals, or those lacking in prepotency, and holding only to the best that represented the type, breeds have been raised to superior levels. It is through such a course of development and breeding that has been evolved such a beautiful Short-horn cow as that shown in Fig. 30. This magnificent beast of Aaron Barber's is no accident. Note the grand constitution shown in the great depth and thickness of body at the shoulders, and the deep prominent breast and stylish carriage of head, expressive of the best in the Short-horn character. Further, note the level and undoubtedly broad back and full hind quarters with the short legs and small amount of waste in the blocky body. The pedigree of this highly-developed beef type will unquestionably include numerous progenitors celebrated for high qualities and prepotency. One may stand off and look at such as she and say without hesitation, "This is breeding!"

WHY NOT CROSS-BREED?—A few weeks ago the writer was on the programme of a farmers' institute to discuss the subject of "Crossbred vs. Purebred Live Stock." Late in the discussion of the subject, after various persons had spoken of crossing this and that breed, one man arose in the back of the hall and said, in substance: "I know that for a great many years breeders who knew more than I can hope to, spent time and effort in developing certain breeds of live stock that have just the qualities I want. They have created the highly-developed Jersey cow for milk, the Short-horn or Hereford for beef, the Berkshire or Poland-China for pork. Now why should I try to create something different, when I know that these men really have produced the things I want in these or other breeds?" That man gave the correct, intelligent expression. Why should he want to cross two different breeds? He should not unless he is a very exceptional student of the laws of inheritance and breeding, and has some well-defined, reasonable policy in mind that may be continued experimentally for generations. Rather the breeder should very carefully learn what the true capacity of a breed is, what it has done and may accomplish. If one will work with animals representative of good specimens of our common breeds of to-day, he will not be likely to be dissatisfied with results. But he must select his stock with caution and judgment. He should ever have in mind this law, that "like produces like." If he is to use breeding males owned by neighbors, he should not be influenced by the service fee, but by the relative merits of sires. If he is to buy, he should first seek the type and style of animal needed for the herd, and then talk price.

A CHAMPION SHORT-HORN COW. FIG. 30.

A SHORT-HORN SERMON.—This beautiful Short-horn cow teaches a sermon in good breeding. That beauty of form means high ideals, the result of superior mating in parents, grandparents, great grandparents, etc. No doubt, old Amos Cruikshank looked with pride on individuals of his in the pedigree of this cow a half century ago, for this cow shows ancestry, and ancestry means breeding, at least of some sort. We do not have these facts in mind enough. Remember that long legs, narrow backs, thin chests and poor quarters reproduce just as well as the very best type, and also do not forget that it costs just as much, yes, more, to feed one of these undesirable sorts, as it does the better one. I wish to illustrate that fact. We have at Purdue University two Hereford cows of the same general type and character as this Short-horn cow. These animals have inherited from past generations a great tendency to flesh production. They always feel mellow and plump to the touch. No matter how poor the pastures, these cows never get thin, as farmers ordinarily consider thinness of flesh, and in spite of this fact these two cows are the easiest keepers in our barns. They require less digestible food, and less grain to keep up a good condition of body fat, than anything else we have. This in a marked degree. And their calves, which have always been sired by superior males, have inherited the same characteristic easy-feeding qualities. It is simply another illustration of "like produces like." Whenever our breeders are duly impressed with this great truth, then will the average herd and flock of America begin to take its proper place in our live stock economy, and not till then. All the rest is guesswork.

Indiana Exp. Station. C. S. PLUMB.

ARGUMENTS FOR APPLE BOXES.

The Box as an Apple Package.

Regarding the apple-box question, the principle issue would seem to be facility in marketing. Will the apple box better enable the producer and consumer to save what the wholesaler and retailer now pocket, which is in many instances almost the whole hog? Will the box enable the grower to deliver direct to city homes, and cannot this be brought about by means of the small advertising columns in the city dailies? The apple barrel is economical, and this point is much in its favor. In New England towns emptied flour barrels generally may be had for 10 to 15 cents each. If these are swept out carefully and stored properly, not more than through one season, they answer the same purpose as new barrels, costing three times as much. If apples are to be stored over Winter in a cellar the small amount of flour which inevitably remains, in spite of all attempts at cleaning, speedily decomposes, and becomes a prolific source of rotten fruit. But the cellar for apples may be regarded as out of the question. The farmer is hopelessly behind the times who does not keep them above the ground in some room or building which is kept just barely at the freezing point. If this is over a non-freezing cellar, and three or four apples on the top of each barrel becomes half frozen during the successive cold snaps, the conditions are just right. Under these conditions an old barrel is as good as a new one. Now, who is going to furnish the farmer with so good an apple package, at so satisfactory a price, I would like to ask? If all the miscellaneous groceries came in boxes of uniform size and style, free from all advertising legends and labels, say of one bushel each, and three of these came as cheaply to the farmers' hands as one barrel, the matter would be much simplified. I would rather nail up three boxes than head up one second-hand barrel, and do the job properly for shipment. Will some enterprising manufacturing grocer come to the farmer's aid by sending out all products in neat boxes of uniform and approved size, free of all advertising matter save cards easily removed? The active demand for the empty package should stimulate the retail grocer to use his influence in their direction. It is apparent, the economy in having boxes destined to become fruit packages, made and distributed from large centers and cost of delivery among farmers already covered. Economy is the order of the day. The trusts practice it; indeed, they exist for this sole purpose if we may credit their assertions. And I am confident that the question of first cost of the package to the producer, penny-wise and pound-foolish though it be, must for a long time to come dominate with the masses.

Massachusetts. F. W. PROCTOR.

Convenience of the Package.

I agree with THE R. N.-Y. in regard to the apple box in preference to the barrel. The box that I would prefer would be a bushel box with a division in it, the same nature as the California fruit boxes, not a seven-eighth, but a bushel. The California boxes hold more than a bushel; I suppose they count for shrinkage. Among some disadvantages of the barrel, in packing by the fruit grower sometimes they are faced on the bottom, in case that end be opened, then the apples are poured in, falling a distance of two feet. Some are soft and are bruised, and soon there is a bad apple ready to contaminate the whole barrel. A barrel is too heavy for one man to lift; he can roll it on end, but that does not always put it where it is wanted, and it is often the cause of words bad enough to spoil the apple. It is unhandy to get the bottom apples out unless the barrel is turned over, and sometimes it falls to the lot of the housewife who has bought the barrel of apples. A box of apples is usually handy, packed in a close space easier handled, and at market with the lid torn off a customer can with a few digs see into the heart of the box, and the seller need not fear to meet the buyer again. Some persons would like to have a bushel or a half bushel of apples to suit their circumstances; the box would be a great accommodation. We used to have nothing but 60-box berry crates. They have disappeared fast; small dealers all prefer the 32-box crates. Bushel peach crates are getting scarce; the half bushel baskets are in the lead. Customers want to look over as much of their goods as possible before buying, and so we all do in everything.

P. S. PEASE.

Van Deman's Fruit Notes.

ALL SORTS OF QUESTIONS ANSWERED.

Trimming June-Budded Trees.

L. P. L., Pennsylvania.—In setting June-budded peach trees can they be trimmed back to form a head the first year, or should they be allowed to grow one year before being cut back? Head wanted 2½ feet from ground.

ANS.—June-budded peach trees are usually so small that their tops are about the right height at which to form the main branches. Unless there is some exceptional circumstance there need be no delay about starting the top. My plan is to head peach trees lower than 2½ feet; I think 1½ to two feet plenty high.

Pruning Cherry Trees.

M. B. M., Pine Bush, N. Y.—A nursery firm told me to trim cherry trees in the Winter. My neighbors told me to cut the grapevines down out of the cherry tree after the leaves dropped, which was done. Was this right?

ANS.—The best time to prune cherry trees is in the early Spring, just before the leaves start. During the severe weather of Winter is not a good time, but in the mild weather of that season it will do very well, if there are no very cold spells following. It is not the proper thing for grapevines to entangle themselves among the tops of cherry trees.

Wounded Elm and Maple Trees.

S. J. P., Grand Rapids, Mich.—We sawed off the lower limbs from some elm trees 10 inches in diameter when in leaf, in 1899; last Summer the sap ran from the places. We put on thick paint and bound on cloth, yet they bled until frost came. Our maple trees split open from the cold of two Winters ago. They are split to the heart and the wood is weatherbeaten. Will it kill them, or will the wounds grow together? What publication is devoted to growing vegetables under glass, or partly so?

ANS.—It is no wonder that the sap ran from the wounds made by sawing off large branches from the elm trees, and this is something that should never be done to any tree unless absolutely necessary. These scars, and those made by the splitting of the maple trees, may heal over in time, if they are not too large. About the only thing that can be done in such cases is to paint the raw surfaces and trust to nature to do the rest. I think the agricultural experiment station at Lansing, Mich., has a publication for free distribution on gardening under glass.

York Imperial Apple.

E. H., Brayton, N. Y.—What do you think of the York Imperial apple for northern and eastern New York? Could you give a short history of this apple, habits of growth and size, color, shape, keeping qualities, demand in market, etc.? It was recommended to my brother last Winter in western New York. We could not find the trees in market, but found some scions in Pennsylvania, and as it was late in the Spring when I sent for them, there were only a few that lived. I grafted them into a young tree about one inch in diameter, and have a fine lot of scions on that tree; they grew very well. Would it be advisable to graft into native trees, and to set out a young orchard of this sort? We have been setting Ben Davis, R. I. Greening, Wealthy, Wolf River, Northern Spy, Baldwin, etc. R. I. Greening grows to perfection here with us. One young R. I. Greening we had set seven years had eight bushels of picked fruit besides what blew off.

ANS.—The York Imperial apple tree has a very good habit of growth, being thrifty, sturdy and forms a round head. It is about as hardy as any of our good varieties. The fruit is medium to large in size; flat but irregular, rhomboidal or lopsided shape; yellow, well covered with striped and mixed red; of very good quality; and is in good demand in the markets of Europe as well as in America. How it will do when grown in New York is yet to be seen, but it may prove quite a success. My advice at the present time is to try it in a small way all over that State. The trees are being propagated by many of the nurseries now. Good nursery trees are so cheap that it would not be profitable to graft seedlings on the farm and set them into an orchard, nor would such trees be satisfactory when planted. The varieties mentioned as having been planted are very good for New York, except Ben Davis, which is not very suitable for that climate because it does not reach its proper state of development.

Cherries in New York State.

N. J., Walton, N. Y.—What varieties of cherries would you advise planting for market in this locality? I have 50 Montmorency set two years ago that seem to be doing well. I have thought of planting quite largely of Windsor, but am not certain that it would be profitable or hardy enough to stand our climate. Hardly any fruit is grown about here, so I do not have the experience of others to guide me.

ANS.—It is well proven that Windsor and all other sweet cherries are less hardy than the Montmorency and others of the sour class, and where the climate is severely cold it would be unwise to plant the former. Richmond, Philippe and English Morello are other good kinds that are hardy, but they are tart in flavor.

WHEN you write advertisers mention THE R. N.-Y. and you will get a quick reply and "a square deal." See our guarantee 8th page.

☞ Should you object to paying ten cents for a seed catalogue (even though it is worth a dollar), then **write a postal card** for **Burpee's "SEED-SENSE" for 1901,**—a "strictly business" catalogue of ninety pages. W. ATLEE BURPEE & CO., PHILADELPHIA, PA.

Apples for Vermont.

M. W. S., Fairlee, Vt.—What is the best late keeping red Winter apple for the middle belt of Vermont, east and west? What are the best three varieties? Ben Davis thrives here, but is of inferior quality. Baldwin and R. I. Greening winterkili, and Northern Spy is a slow grower. How are Arctic, McIntosh, Sutton and Canada Baldwin with Wagener as a filler, where a filler is desirabie? Fameuse does weii, but spots badly and bears but every other season.

ANS.—Such an apple as is desired would be a boon indeed. Ben Davis is out of its rightful territory in central Vermont or any other equally northern latitude. Arctic, Sutton, McIntosh and Canada Baldwin have been so little tested there that it is impossible to say at this time how they will do there, but they are worthy of testing. Wagener will be very good as a filler if it proves hardy enough, which I believe is the case. Hubbardston might be a good one, and it would be well to try it.

H. E. VAN DEMAN.

Whip Grafting; Palmer Greening Apple.

F. P. B., Ayer, Mass.—1. I never saw any grafting done, but I whip-grafted some small trees iast Spring by the directions in your paper. I tied the smali branches together with soft string and waxed them. Is there anything to be done to them next Spring? I was not sure that they would grow, so I grafted the smali side branches. They grew finely. Will it be ali right to cut off the main branch back to the branches I grafted? The trees are four years oid. 2. We have an apple growing here that is one of the finest Winter appies I know. It is called the Palmer Greening. The Massachusetts Experiment Station calls it Washington Royai (Paimer Greening). Can you tell me of a nursery that seiis the trees? I have a dozen cataiogues, but none of them advertises it. One agent here toid me that he had an order iast Spring for 700 trees, but couid not get them. One farmer toid me he had never sold a barrel for less than $2.50 and some as high as $5. 3. Are there any plums that are curculio-proof, and where can I buy them?

ANS.—1. The proper way to graft is to first cut off the main branches and set the scions in them. Without seeing the work as it is done it would be impossible to give positive advice as to the cutting off of the main branches above the small grafts. If they are likely to make good substitutes for the main branches this may be done, but if they are not then it would be better to graft these main branches next Spring by the cleft method. 2. Washington Royal is an apple that is rarely grown in any of the nurseries. Scions might be furnished to a reliable nursery and trees propagated especially for those who want them. Undesirable trees might be top-grafted with this variety and fruit soon obtained. 3. So far as I know there is no such thing as a variety of plum that is absolutely curculio-proof. The Japan and American types are nearly so. Abundance, Burbank, Wyant and Surprise are of this character. H. E. VAN DEMAN.

Spraying Peach Trees; Wood Ashes.

J. H. C., Gillett, Pa.—I have a young orchard of 250 peach trees, and they were set iast Spring; they made a fairiy good growth last Summer, and have no disease that I know of. Do you think they would need spraying in the Spring? If so, at what time, and with what soiution? I have a lot of unieached wood ashes that I would iike to apply as a fertiiizer. How much would you appiy to each tree, and when? The soii is not poor nor very rich.

ANS.—There is nothing to be gained by spraying peach trees that have only been planted one year, and are apparently healthy. If peach trees are attacked by San José scale spraying with whale-oil soap, or kerosene emulsion may be resorted to during the Winter, when the trees are dormant, with good effect. If an orchard has had a severe attack of curled leaf one year, Bordeaux Mixture thoroughly applied early the next Spring, before the buds have opened, will have a tendency to prevent a recurrence of this trouble, but the foliage of the peach is so easily injured by the various spraying solutions that more harm than good generally results from spraying the trees when in full leaf. Unleached wood ashes may be applied to peach trees with good effect at any time, and in almost any quantity (from a quart to a half bushel per tree). If applied early in the Spring just when the frost is coming out of the ground, the Spring rains will dissolve the potash and wash it down immediately where the roots can get it, and the trees will be more apt to get the full benefit than if used at any other time. In applying any fertilizer it should be scattered in a circle a little larger than the spread of the branches, as that is where the feeding roots are to be found; it should never be piled around the trunk of the tree. GABRIEL HIESTER.

Strawberry "Rust" and "Blight."

A. G. W. Reidenbach's Store, Pa.—What is the difference between Strawberry blight and Strawberry rust? How is bilght distinguished, and is there any remedy?

ANS.—Strawberry "leaf-blight," "leaf-spot," or "rust" are interchangeable terms for the same disease, caused by the fungus Sphærella fragariæ. It usually first makes its appearance on the new leaves, about the time the fruit sets. Reddish spots a fraction of an inch in diameter appear, and soon these spots have a nearly round white center. This disease is readily held in check by spraying with Bordeaux Mixture and, where badly diseased, it is a good plan to mow off the old foliage, then to remove and destroy it. Applications of Bordeaux Mixture should be begun as soon as growth starts in the Spring, and non-bearing plants may treated throughout the Summer, the plants being sprayed at intervals of three or four weeks. Bearing plantations will derive much benefit from a treatment made when growth starts in the Spring, and from another made when the first blossoms open. It is advisable to reset beds often and to be particularly careful with the spraying of the seed plants. The plants should not be sprayed during the bearing season. M. V. SLINGERLAND.

Ruralisms

NOTES FROM THE RURAL GROUNDS.

THE KUMQUAT AGAIN.—Many letters are being received inquiring where plants of the kumquat may be had. Trees suited for pot culture are grown and offered by the Glen St. Mary Nurseries, Glen St. Mary, Fla., and J. L. Childs, Floral Park, N. Y.; P. J. Berckmans Sons, Augusta, Ga., and Reasoner Bros., Oneco, Fla. There may be other nurseries importing or growing this interesting plant, but they have not come to our notice. Strong grafted trees are offered at prices ranging from 45 to 75 cents each, according to age. These trees can usually be potted in a seven or eight-inch pot, and should bear as soon as established. The hardy orange stocks on which they are grafted have naturally a short annual season of growth, and are inclined to remain dormant during Winter no matter how warm and stimulating the temperature in which the plants may be kept. One must not be disappointed if the trees break into growth very slowly after being potted, as new rootlets are first formed. The Otaheite orange is now offered in almost every plant catalogue at an average of 25 cents each. J. Y. P., Hudson, N. Y., who has been long instrumental in advocating the Otaheite orange for window garden purposes, writes that it may be readily propagated by anyone, as cuttings of firm wood root very readily in moist sand. This we have found to be measurably correct, as properly-selected cuttings are quite certain to grow, but they require a period of eight to 10 weeks to form roots, and need quite uniform conditions of temperature and moisture during the interval. The kumquat does not propagate readily from cuttings, and grafting or budding on congenial stocks seem the only practical ways to increase it. F. H., Ludlow, Vt., writes as follows concerning the likelihood of seedling oranges perpetuating the good qualities of their parents:

> You stated recently that seedling oranges are usually worthless. This is wrong, as seedling oranges are almost always excellent and many of the old Florida groves, before the freeze, were seedlings. Mine was set out that way as late as 1884, and I only changed it over to get it into bearing quicker. See also Thomas's fruit book.

The writer has examined many thousands of seedling orange trees in the West Indies, Central and South America and is free to say that very few produced any fruits agreeable to the taste. Possibly they were about as good as their own seed parents, but the same may be said of the seedlings of our pome and stone fruits. Seeds from selected fruits of choice varieties may give rise to as good or better fruits than the trees from which they were taken, but long experience has shown that the fruits of seedling trees vary too widely in essential qualities to be of practical value, except to the seeker after new varieties. The slowness with which seedling Citrus and other fruit trees come into bearing is perhaps the strongest reason for budding or grafting varieties of known excellence on them, as the bud or scion will come quickly into bearing, being part of a plant of mature growth.

SOMETHING ABOUT CARNATIONS.—The Winter-blooming carnation has come to be the most important commercial flower grown in America. While not bringing the high prices asked for roses, the aggregate number grown and sold is astonishingly large, and an immense area of glass is used for their production. There are probably more comfortable little incomes derived from carnations by careful growers than any other strictly ornamental plant. Lately much capital has been invested in the production of carnation blooms on a large scale, and there has been created a veritable boom in this dainty plant which is called by its admirers the "Divine flower." A wealthy capitalist was reported to have paid $30,000 for a striking new variety last year. He named it after his wife, Mrs. Thomas W. Lawson, and it made a great sensation on its first appearance on account of its large size and fine deep pink color, but has failed to meet the expectations of the growers, as it produces too many short-stemmed blooms. The sale of another new scarlet variety for $5,000 has just been announced. This is supposed to be a purely commercial transaction, the love of notoriety not being a factor. The purchasers are propagators who expect to make a profit by selling the plants. These prices probably represent high-water mark, and are doubtless much above the intrinsic value of any plant novelty. The list of varieties now grown is appallingly large, and new additions are being made weekly. The number of growers who are hybridizing and raising seedlings is certainly larger than those interested in the breeding of all other plants combined. This great activity is quite certain to produce results of permanent value, though the lot of most of these expectant originators may not prove a happy one, as the real improvements are few and failures many. The forcing carnation has been brought to its present state of comparative perfection within the last 25 years, though the type from which they were developed originated in France in 1840 by crossing the early and late-blooming varieties then cultivated, producing for the first time a constant or everblooming class. So many factors go to make up a practical forcing carnation now that many attractive varieties, each possessing distinctive features, are quickly discarded because they do not meet all requirements. The carnation wanted must be not only large and perfect in form, pleasing in color and highly fragrant, but must possess a resistant calyx which will not easily burst, stiff, long stems that carry the blooms gracefully erect, and must be an early and persistent bloomer, under fair growing conditions. Carnations are sold by the dozen or hundred, and a constant supply is needed. No other flower so well meets the wants of persons of moderate means, as they are very lasting as well as beautiful and fragrant. In almost every batch of seedlings, even when grown from the most highly-developed parents, individuals will occur reverting back in form and color to the single wild flesh-colored pinks grown by the Greeks 2,000 years ago and mentioned in writings long before the Christian Era. The carnations most widely grown at the moment seem to be William Scott, pink; Daybreak, blush; Flora Hill, white; Jubilee, scarlet and Pingree, yellow, although these standards are rapidly giving way before the hosts of new varieties pressing for recognition. One or all may be superseded by another season.

THE WINTER RHUBARB.—As previously noted, several clumps of rhubarb were placed in each of two cellars on the Rural Grounds December 12, to grow or force for Winter use. Each lot, consisting of five four-year roots, was covered with moist soil on the earth floor, in a place where the light is dim. One cellar is heated at the point where the rhubarb is planted to a fairly constant average of 55 degrees; the other is unheated and barely escapes frost in severe weather. The clumps showed signs of breaking into growth in both cases the last of December, and on January 20 the first stalks were ready for use, having reached a length of 14 inches in the warm cellar, while the cool lot has made but a trifling advance, being only two or three inches high. A plant of Burbank's new Crimson Winter rhubarb planted December 20 in a large pot in the greenhouse started at once into growth, and now has stems a foot long. It is already distinct in appearance from the ordinary kinds, but the plant is too small yet to develop its full characteristics.

HOPE FARM NOTES.

HOUSEHOLD MATTERS.—One would think it should be a long jump from a discussion of piety to a talk about pie-eating, but I don't know—after reading this letter. It really looks as though some of these good people regard pie-making as one of the essential forms of right living:

In your Hope Farm kitchen statistics you have named no pies. Now, if I were a betting woman, I should not be afraid to bet you would be glad to have 365 of those pies that the man gets down in Pennsylvania. You say you "like puddings better!" You remind me of the maxim, "Sour grapes hang high." My men folks like pies; they like them so well that they offer to pare the apples in the evenings, so that they can have more pies. If a hired man should tell me he didn't like pie I should know something must be wrong. Doesn't your mouth water to think how nice a piece of appie pie would taste, made in an old-fashioned deep yellow dish, such as our grandmothers used to make? Don't your women make bread? Don't you know that biscuits are a great cause of dyspepsia, and the worst things you can eat or give children to eat? I suppose you feed your folks on oatmeal cooked about half an hour or less! I believe oatmeal and biscuits as bad for children as plain cakes and pies. I find that if you want your hired man to work, he can't work on oatmeal; it will not stand by him until noon. When I get very tired my husband doesn't settle into the big soft chairs, or the boys either, after supper. They wipe the dishes for me. Don't spend any more time figuring on those dishes. Take a towel and see how long it will take you and those boys to help the women folks to get them done. Then you can all sit down, and enjoy the evenings together, as we do.

MASSACHUSETTS FARMER'S WIFE.

Mouth water! Why, I much prefer baked apples or apple sauce to all the apple pie you can bring along! I don't want my fruit jailed in a cell of flour, butter or lard. I was born and raised in the old Bay State, and know what a good pie is, but now the craving is all out of my heart and tongue, and I am no longer a slave to *crust!* My judgment is that average pie crust brings one much nearer to a dose of medicine than a biscuit. Yes, the Hope Farmers make bread—over 10 loaves a week! It so happened that during the April when we took notes the bread was bought of a baker. Of course we have something besides oatmeal to eat! As for dyspepsia we will match doctor's bills with any family or families averaging 12 persons—and the red color in the cheeks of the Bud, Graft and Scions isn't hand-painted either!

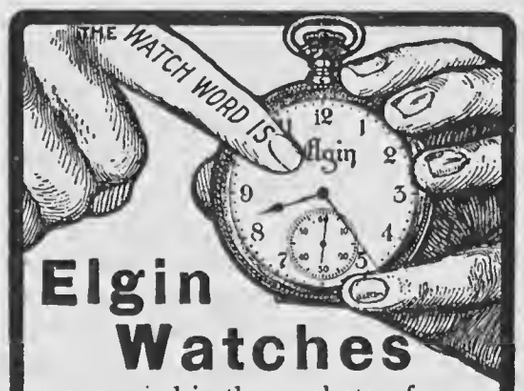
DISH WASHING.—Somehow those kitchen statistics seem to have struck home. Here is a man from Michigan with a new scheme:

In Hope Farm Notes you bewail the drudgery of the women of the household in having to wash the supper dishes year in and year out, and figure out how many acres of earthenware and miles of knives and forks have to be washed and wiped in a year, but you suggest no remedy, unless we are to infer that the old man ought to rise in his mightiness from his easy chair and take a hand. I'll tell you how we manage the supper dishes; we don't wash them, but merely turn the plates till morning and eat breakfast from them. Of course, we leave no messes to be cleaned up. It is a mighty poor calculator who can't measure his capacity with his eye—mind's eye. By this scheme my wife saves at least half an hour every evening, and in the 20 years we have been married this would amount to a whole year. Think of the books, etc., she can read instead of standing on her feet and washing acres and acres of dishes for an entire year! And we do not have a monopoly of this labor-saving device. There are others, and they are not called poor housekeepers either. F. X. C.

I am not ashamed to say that I once had to wash and wipe dishes for a living. I claim to be an expert at this business, but I never heard of this labor-saving scheme before. I would like to know how the cups and glasses are turned inside out so as to hold liquid. I think our folks would rather wash twice. Of course your humble servant shakes the towel at times. S. R. Divine has invented a dish drier that seems like a fine thing. It is a rack of light wood with a flat pan at the bottom. The dishes are placed in the rack and well soused with *hot* water. They dry quickly, while the water runs out of the pan. Such dried dishes have a gloss or polish. It always seemed to me that a towel rubbed bacteria in rather than wiped them out.

FARM NOTES.—All our animals except the hens have had the waste molasses and all like it. It is certainly a useful and cheap feed. The old horses in particular show that it has sweetened life for them a little. . . . I never expect to see one patch of Crimson clover again, and it is my own fault. It was seeded in the orchard after oats, and made a good start. It looked so nice that in November I told the boys to turn the horses in to nibble it. The weather turned warm and muddy. As is usually the case, the stock left everything else and made for the clover. They grazed it close and tramped and pounded it in so that it now looks dried enough. It makes a fellow feel like a criminal to know that he is responsible for the ruin of clover! . . . Those Winter oats are still alive. They look about as thrifty as the rye—which is a surprise to me. . . . A cold snap struck us January 19. When the mercury sank to four degrees at nightfall we thought of our tussle with frozen pipes last Winter. We found the exposed point and protected it, just as a man who takes cold in the throat will buy a scarf or turn up his coat collar. We were taking no chances, though, and so we turned on the windmill and let it pump water into the tank until bed time. This stirred up the water and raised the temperature so that no harm was done. A couple of pigs in a small outdoor house suffered until we tacked a fertilizer sack so that it hung down in front of the door. This kept the wind out. . . . We are selling out the last of the cabbage, which kept quite well above ground in an old chicken house. The pile in a fence corner, covered with corn fodder, has not been touched. H. W. C.

WHEN you write advertisers mention THE R. N.-Y. and you will get a quick reply and "a square deal." See our guarantee 8th page.



Elgin Watches

are carried in the pockets of over eight million people—are known everywhere as

The World's Standard

because of their mechanical perfection, accuracy and durability.

Genuine Ruby Jeweled Elgins

are sold by Jewelers everywhere in various sizes and styles.

An Elgin Watch always has the word "Elgin" engraved on the works—fully guaranteed.

Booklet Free.

ELGIN NATIONAL WATCH CO.
ELGIN, - ILL.

No crop can be grown without Potash. Supply *enough* Potash and your profits will be large; without Potash your crop will be "scrubby."

Our books, telling about composition of fertilizers best adapted for all crops, are free to all farmers.

GERMAN KALI WORKS,
93 Nassau St., New York.

AN ACRE OF CORN

and its possibilities under the Silage system—being the theme of

"A BOOK ON SILAGE"
By Prof. F. W. WOLL

of the University of Wisconsin. Revised and up-to-date, neatly bound into a volume of 234 pages. It embraces full information from planting to feeding the crop, and includes working plans and specifications for building all silos. Also embraces:

I—Silage Crops. II—Silos.
III—Silage. IV—Feeding of Silage.
V—Comparison of Silage and other Feeds.
VI—The Silo In Modern Agriculture,

And illustrations and complete plans for round and rectangular silos, dairy barns, tables of compounded rations, etc. **Mailed for 10c. coin or stamps.**

SILVER MFG. CO.
Salem, Ohio.

Make Money

on your *cabbages, onions* and *early beets.* How? Force their growth with applications of

Nitrate of Soda,

the quickest of all fertilizers. Especially adapted to early vegetables. Produces size and quality at the same time. Book, *"Food for Plants,"* tells how and why. Free by addressing **John A. Myers,** 12 O John St., New York. *Nitrate for sale by fertilizer dealers everywhere.*

Cider Machinery.—Send for catalogue to Boomer & Boschert Press Co., 118 West Water St., Syracuse, N.Y

$17.70 BUYS This Ball Bearing ALL STEEL **Disc Harrow.**

Has 12 discs 16 in. in diameter, cuts 6½ ft., weighs 340 lbs. Not a piece of wood to rot or wear out. Runs easy because the ball bearings reduce the friction. Has mud scrapers and all latest improvements.

Made in 9 Sizes with 8 to 16 discs, either 16 or 20 in. in diameter, furnished with or without center disc and with or without eveners for two, three or four horses.

We Guarantee it to pull easier than any other harrow of same style, that it is made of best material. If any part breaks or wears out within 1 year on account of poor material, we replace it free of charge. If not found all we claim for it and the best disc harrow you ever saw or used, return at our expense.

$8.50 for our Steel Lever Harrow, 2 sections, 60 teeth, cuts 10 ft. Complete with draw bar, also 3 or 4 sections. Also spring tooth and all other harrows at reduced prices. Send for free 328-page Agricultural Catalogue.

Marvin Smith Co., 55-57-59 N. Jefferson St., Chicago, Ill.

You Send No Money

Until Goods Arrive.

All Steel and Iron but the pole. Easily handled by two horses Send for delivery prices on all sizes. Disc Harrows, Lever Harrows. 11-foot Seeders.

EMPIRE MFG. CO., 62 River St., Sterling, Ill.

THE LIGHTNING SEED SOWER

Guaranteed to **sow 60 acres per day** (either horseback or on foot) of Clover, Timothy, Millet, Flax, etc. Will be sent to any Post Office on receipt of..... **$1.25**

If not satisfactory, money refunded. Circulars free. Agents wanted.

W. J. BUSS, 53 Day St., Golden, Ill.

YOU CAN'T AFFORD TO FARM without a Low-Down, Broad-Tire, Flat Platform, Short-Turning Farm Truck any more than you can afford to cradle your grain; and you can't afford to buy any wagon until you have seen our latest catalog. It is full of information.

FARMERS HANDY WAGON CO.,
Saginaw, Mich.

THE MICHIGAN Wheelbarrow **SEEDER,** the only practical seeder made for all kinds of grass seed. Not affected by wind or rain. Lightest and easiest running. **SOLD ON TRIAL** at a low price. Booklet with calendar free.

Box 20, Homer, Mich.

Fruit Packages
For BERRIES, PEACHES, GRAPES and MELONS.

Illustrated Catalogue, FREE.

DO YOU SOW SEED?

If you do you need the only practical hand seeder made, the

CAHOON BROADCAST SEEDER

saves one-third the seed; four-fifths the labor. Ask your dealer and take no other. Send for circulars.

Goodell Co., 14 Main St., Antrim, N. H.

THORBURN'S SEEDS

They have been developed by careful, thoughtful propagation throughout the Nineteenth century. Thorburn's 116-page Century Catalogue of these

Seeds of a Century

is the 100th successive annual issue. If you would have a more beautiful lawn, or a more productive garden, send for it. It's *free.*

J. M. THORBURN & CO.
(late of 15 John Street)
36 Cortlandt Street, New York.

Maule's (*35 new things for 1901*)
Seed Catalogue

You should, by all means, have this **most modern catalogue of modern times.** It is brimful and overflowing with good things in vegetable, farm and flower seeds, flowering plants, fruits, bulbs, etc. **It contains 35 novelties in vegetables and flowers never offered before,** has 136 large pages, seven handsome colored plates and hundreds of illustrations. It gives practical, up-to-date cultural directions and offers many cash prizes. The first edition alone costs over $30,000, so while we send it free to all customers, we must ask others to send 10 cents for it, which amount they may deduct from their first order. You will make a mistake if you do not write to-day for this the Novelty Seed Book of the year. Address,

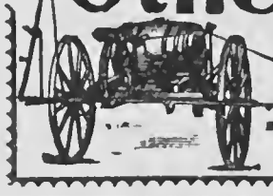
WM. HENRY MAULE, Philadelphia.

SPRAY with **"EMPIRE-KING"** or **THE GARFIELD KNAPSACK**

and bugs, worms, blight, etc., will have no terrors for you. Best construction, perfect agitators, no scorched foliage. We make all sizes and styles. Free Book on Spraying. Agents wanted.

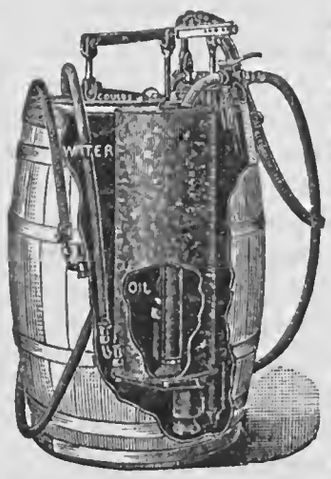
FIELD FORCE PUMP CO., 2 Market St., Lockport, N. Y.

Other People's Profits



have increased 25 to 50 per cent. when they began to spray *the right way*—with the right sprayer, the **PEPPLER AND CLIMAX SIX-ROW SPRAYERS.** They will do as much for you. Read how they spray 30 acres a day, how they save ½ the poison, increase crops one-half, pay for themselves in one season. Catalogue contains spray calendar, formulas, etc. Sent free. I also manufacture the improved Riggs Plow and Riggs Furrowers.

THOMAS PEPPLER, Box 60, HICHTSTOWN, N.J.



(PATENTED).

Goulds "Kerowater" Spraver

For Emulsifying and Spraying Kerosene and Water.

Endorsed by the leading Horticulturists and State Experimental Stations. A kerosene sprayer which *accurately* proportions the mixture for any desired strength. Built in three sizes, for tank, barrel or knapsack use. There is a great demand for them. Ask your dealer or write direct to us.

"How to Spray, When to Spray, What Pumps to Use," a valuable Booklet, free for the asking.

SUBSCRIPTION: ONE DOLLAR A YEAR.

To foreign countries in the Universal Postal Union, $2.04, equal to 8s. 6d., or 8½ marks, or 10½ francs.

"A SQUARE DEAL."

We believe that every advertisement in this paper is backed by a responsible person. But to make doubly sure we will make good any loss to paid subscribers sustained by trusting any deliberate swindler advertising in our columns, and any such swindler will be publicly exposed. We protect subscribers against rogues, but we do not guarantee to adjust trifling differences between subscribers and honest, responsible advertisers. Neither will we be responsible for the debts of honest bankrupts sanctioned by the courts. Notice of the complaint must be sent us within one month of the time of the transaction, and you must have mentioned THE RURAL NEW-YORKER when writing the advertiser.

Name and address of sender, and what the remittance is for, should appear in every letter.

Remittances may be made in money order, express order, personal check or bank draft.

THE RURAL NEW-YORKER,
409 Pearl Street, New York.

SATURDAY, FEBRUARY 2, 1901.

WE wish again to remind our old friends that a club of four names with $4 will secure a renewal of the club-raiser's subscription for one year—the five names for $4. There are many subscriptions expiring now this month. Why not take an afternoon and work up a club in your neighborhood? We have other inducements for those who take an interest in the matter. For one new name we will send you any one of these books:

Celery Growing and Marketing	1.00
Landscape Gardening, Long	.50

For a club of four, any of these books:

Horses, Cattle, Sheep and Swine, Curtis	$2.00
First Lessons in Agriculture, Gully	1.00
Practical Farm Chemistry, Greiner	.75
The Spraying of Crops, Lodeman	1.00
The Nursery Book, Bailey	1.00
Fertility of the Land, Roberts	1.25

The books are sent post-paid. They are cloth bound, and the best and latest books on these subjects. This is an opportunity for young men or old to get books.

*

THE use of clover as feed and fertilizer extends back for over 2,000 years—yet there are still farmers who know little about it. In parts of the West "clover farming" is a regular feature of agriculture. The clover, in rotation, keeps up the fertility of the farm, and provides for the manufacture of meat or milk. Somehow, of late years, the agricultural writers have stopped talking about clover—as though the time had come to lay this good friend aside with the dust-covered relics of old days. We are glad to announce an "essential-principle" article on "clover farming" by L. N. Bonham, of Ohio.

*

SECRETARY Gage went before the Senate Agricultural Committee with an argument against the Grout bill. In the report of his remarks we are told:

> He explained that many of the inspectors were not experts and could not detect oleomargarine without analysis. He also said that there was not adequate force to see that the oleomargarine law was carried out in every particular. He pointed out that there were 4,000 dealers in Chicago, and that it would be impossible to watch them all. The collection of the revenue was the main object of the department.

That is just the point we have often made. After the oleo gets out of the factory it is impossible to tell what becomes of it all. It is certainly easier to tax it in 17 factories than to watch it in 17,000 stores!

*

SOME remarkable statements about the power developed in the modern locomotive are made by George H. Daniels, of the New York Central Railroad. He said, among other things, that a single locomotive hauled a passenger train of 15 cars from New York to Albany, a distance of 143 miles, in three hours and 15 minutes. This train weighed 1,832,000 pounds, and was 1,212 feet, or nearly one-fourth of a mile, in length. The rate at which the train traveled was 44 miles per hour, which was the regular scheduled time. Another train weighing 608,000 pounds was hauled from New York to Buffalo, 440 miles, in eight hours and 15 minutes, an average speed of 53⅓ miles an hour. It is wonderful to think how the modern locomotive has been developed. But here is another side of the problem which is worthy of consideration. A single miner working with his ordinary tools in a coal mine may haul out, ready for use, five tons of coal. That represents the force of a man working with ordinary tools; yet half of that day's work placed in a modern engine will haul this enormous train from New York to Albany. It is a striking illustration of the increase of power produced by the application of concentrated force. Compare the labor of the man in digging coal, and the wonderful power of that coal when placed in the engine, and we have an illustration of what may be done with skill, economy and proper management in any department of life. Think what a powerful force the boiler calls to life from the slumbering coal! Man is master over material things, as he is able to arouse and control the slumbering forces of Nature!

*

ILLINOIS is to have a seed-corn inspector, who will visit all the reliable seed-corn growers of the State, and report on the work done. The inspector will decide the seed value and market condition of corn held by each grower. The work will be under the supervision of the Illinois Seed-Corn Growers' Association, the matter being discussed at the meeting of this society, recently referred to in THE R. N.-Y. A. D. Shamel, instructor in farm crops at the State University, has been chosen as inspector. Since so many agricultural interests are founded upon the corn crop, Illinois shows far-seeing wisdom in this system of inspection.

*

To what extent did the war in Africa benefit the trade of this country? One would expect that with a great army to feed England would require great stores of extra food, and that this food would be sent to Africa without unloading. The results are surprising. Here are some figures showing our total exports to Africa during the past 10 months of 1899 and 1900:

	1899.	1900.
Agricultural implements	$313,242	$182,575
Horses	10,910	1,762,617
Corn	349,626	526,569
Wheat	605,386	529,075
Wheat flour	1,126,458	639,993
Cotton cloth	437,101	219,428
Steel rails	502,988	438,569
Boots and shoes	126,865	105,693
Canned beef	461,899	412,446
Hams and pork	31,993	25,619
Lard	177,944	162,250
Butter	2,061	1,592

Thus with the exception of horses the war has hurt rather than helped our trade with Africa. There probably were extra shipments of food direct to England in consequence of the great drain upon that country, but these figures knock the force out of the old argument that war makes a permanent market for the farmer!

"GOD made the country; man made the town!" That quotation, with variations, is frequently heard, and it is as true now as ever. The town is a selfish place, and ever has been. Men who grow up amid brick and stone lead an artificial life. Competition is fierce, life is hard and intense, there are few opportunities for the calm reflection and settlement which the human heart and mind require. The average townsman who has only his head and hands—all perhaps imperfectly trained—is constantly under the lash, and it is no wonder that middle life finds him cynical and unhappy rather than hopeful. We do not pretend to say that all country people can show in their lives and characters what our modern business system has squeezed out of the town dwellers. There have been in the past, and there always will be, farmers who fail to grasp their opportunities, and others who are by nature unfitted for country life. Yet when this is said, we believe that history will show that in the past, great moral reforms—events that have ennobled and dignified mankind—have usually been organized and started by what we call country people. We think that the people of the town have followed rather than led in public enterprises which demanded personal sacrifice and self-denial. The nation that deliberately feeds the town upon the just share of the country home will surely die.

*

IF horticulturists would fight the San José scale in their orchards as hard as they fight about it in their conventions the insect would soon vanish from the earth. At the Western New York Horticultural Society President W. C. Barry prevented a discussion on the subject by a personal appeal which was, to say the least, in bad taste. He referred to the work done by his father, and actually refused to accept another term as president unless the Society would agree not to discuss the matter of fumigating nursery stock. Mr. Barry doubtless desired a peaceful meeting, and he without doubt felt that a fierce discussion would injure or break the Society. He gave the impression, however, of using the powers and political machinery of a politician to cut off a fair and open debate. THE R. N.-Y. firmly opposes such methods. The people are modifying their views regarding the scale and fumigation, and this is no time for the nurserymen to adopt such methods in order to keep fruit growers quiet. The Society finally agreed to ask for an appropriation of $25,000 with which the Commissioner of Agriculture will enforce the present law. Let this law be honestly enforced, and if it does not answer let us have one that will do the work. The nurserymen must not get the idea that they are the only ones to be considered in this matter. The fruit growers have far more at stake, and any effort to stifle their views at public meetings should be sternly condemned.

*

A CERTAIN farmer whom we know has made a success in fruit growing. He has spent time and money, and learned some things which are worth almost as much to him as a patent would be in some lines of trade. One day a merchant, in a nearby town, drove out to the farm and left this word for the farmer: "The next time you come to town I wish you would come to my store! I want to talk with you about business." The farmer went out of his way to call at the store, and found this "business" proposition waiting him:

"Now Mr. Farmer, I expect to set out about 500 fruit trees next Spring, and I want you to tell me what varieties to buy, how to set them and how to take care of them. Tell me the whole story! . . . Thanks! Have a cigar?"

The farmer gave the information. He got home so late that his chores dragged and his wife scolded him. As he milked the last cow this thought ran through his mind: "Suppose I had sent word to Mr. Merchant that I wanted to see him at the farm on business. He comes expecting to sell a good bill of goods and I say to him:

"I think of opening a store out here so as to get the trade of my neighbors. I want you to tell me where to buy my goods, how much you pay, and all your trade secrets of buying and selling. Thank you for the information! Have a drink of spring water!" One can imagine the language of the merchant at such a proposition, yet why is one thing worse than the other? Why do people seem to think that all the trade secrets of the farmer should be made public property? Why does the storekeeper fill his pockets with apples in the farmer's orchard, yet look as black as a thunder cloud if the farmer takes a peanut out of the basket on the counter? If you will answer these questions, we will vote you the wisest man of the age.

*

BREVITIES.

When pie plant gives the first good mess,
With nice hot biscuit, I confess,
Our folks feel good. Pop says, "I guess
You orter have a bran-new dress."
"An' you a coat," I sez, "no less!"
He sets down there with little Bess,
An' tosses her with fond caress,
An' sum o' his ol' tenderness
Outside his good ol' heart will press
An' paint his eyes an' face! Yes, yes!
I know our folks will always bless
The day that pie plant gives first mess.
An' it's jess so with sparrergrass,
An' every other garden sass.
When peas an' greens an' onions pass,
With all the others of that class,
I jest set down my work an' say,
"I do now humbly bless the day
That showed our folks the certain way
To make the kitchen garden pay."
An' while *I'm* made o' livin' clay
That garden is a-gonter stay.

DON'T waste live words on dead issues.

THERE'S both room and company down foot.

THE motive is not always father of the method.

A SIN! A SIN! Not to have eating apples in the bin!

YES, we deride a hobby when we have to get off and walk!

THINK of a man striking 40 without knowing what his forte is.

SOME people must dig out facts, and others must rub them in.

YES, the true catty comb is the tongue—it has catacombed many a character.

WE need plum trees that know how to grow into good shape. Most of them are too bunchy or too straight.

WE would like to see the pardoning power taken away from the Governor and put in the hands of the State Legislature.

NO, my friend, you will never hatch out the money needed to remove the reputation of a patch by sitting down upon it.

"SPITZ" is the name we used to have for the Esopus Spitzenburg apple. "Spits" might do as a name for a Ben Davis out of place.

AN old retired farmer who has lent some money to two other farmers, sends their subscriptions, because he says he will be surer of his interest, if they read THE R. N.-Y.!

THE Mississippi Apple Growers' Association, in convention recently, adopted a resolution condemning the existence of the English sparrow, and petitioning the Illinois Legislature to continue the bounty of two cents a head on each sparrow killed. Do fruit growers generally hold this view?

Events of the Week.

DOMESTIC.—Five men were killed in a freight wreck on the Grand Trunk Railway, near Norway, Me., January 18; four locomotives and many cars were destroyed. . . . . The management of the Wabash Railroad has adopted a rule which prohibits the use of intoxicants by employees before reporting for duty or while on duty. . . . . The White-Shotwell feud at Corbin, Ky., has resulted in three persons being killed, many hurt, and a store wrecked by dynamite. . . . Near Goshen, Ind., January 18, four children were burnt to death in a burning house, while their parents were at the barn milking. It is believed that the fire was caused by a lamp exploding. . . . Disaffected Creek Indians near Eufaula, I. T., are maltreating and killing peaceful Indians, who have appealed to the Government for protection. . . . The city council of Omaha, Neb., has offered a reward of $5,000 for Pat Crowe, dead or alive, irrespective of his connection with the Cudahy kidnapping. This makes the total reward offered for his capture $18,000. . . . Fire destroyed the business portion of Ellsworth, Mich., January 20.

GENERAL FOREIGN NEWS.—Victoria, Queen of the United Kingdom of Great Britain and Ireland, and Empress of India, died at Osborne, Isle of Wight, January 22. She was born at Kensington Palace, London, May 24, 1819, being daughter of the Duke of Kent, fourth son of King George III., and was baptized as Alexandrina Victoria. She ascended the throne June 20, 1837, succeeding her uncle, William IV., and was crowned June 28, 1838; married February 10, 1840, Prince Albert of Saxe-Coburg Saalfeld, her first cousin to whom she had been informally betrothed from infancy. She was the mother of four sons and five daughters; six of her children survive her; became a widow December 14, 1861, and is succeeded by her oldest son, her second child, Albert Edward, Prince of Wales, born Novembr 9, 1841, her oldest child being Victoria, Empress Dowager of Germany. The new sovereign will be styled Edward VII. He married Alexandra, daughter of the King of Denmark, and has three daughters and one son, George, Duke of York, who becomes heir apparent, but does not succeed to the title of Prince of Wales. It is no exaggeration to describe the late Queen Victoria as the best beloved and most deeply reverenced monarch who ever occupied the British throne, her simplicity and purity of life, deep piety and constancy in family affection endearing her to all her subjects, and compelling the respect of those opposed to her by radical or political antagonism.

FARM AND GARDEN.—Efforts are being made by the producers of vaccine to have the Agricultural Committees of Congress omit from the forthcoming Agricultural Appropriation bill further provision for vaccine made and distributed by the Government.

The National Live Stock Association, in session at Salt Lake City, Utah, January 17, adopted a memorial to be sent to the United States Senate, protesting against the Grout bill, which is denounced as class legislation.

In an action for damages by a purchaser of seed guaranteed to be good, but which proves to be entirely worthless, the New Orleans "Democrat" says the Supreme Court of North Carolina, in the case of Reiger vs. Worth Company (37 S. E. Rep., 217), holds that the measure of damages is the amount paid for the seed, the amount expended in the preparation of the soil for the crop, and also reasonable rent for the land.

The French government has conferred the decoration of the Legion of Honor upon Byron E. Huntley, president of the Johnston Harvester Company, this being in recognition of Mr. Huntley's services in introducing improved agricultural machinery into France.

A severe setback has been given the beet-sugar industry in Minnesota by Attorney-General Douglas's decision that the beet-sugar bounty law of 1895 is invalid, following the refusal of the State Auditor to issue a warrant for $20,000 claimed by the Minnesota Beet-Sugar Company. The opinion is based on the principle that the people cannot be taxed for the benefit of a private enterprise.

WESTERN N. Y. HORTICULTURAL SOCIETY.

A GREAT MEETING.—The wisdom of the move to admit people to the convention hall only on presentation of the membership ticket acquired on the payment of $1 was proved by the great number of persons of both sexes in attendance at the opening of the forty-sixth annual meeting at Rochester, N. Y. The hall was more crowded during the entire first day than at any time before, while admittance was free to the public at large. The Society now stands on a firm footing, financially as well as otherwise, and seems far greater and stronger than ever, with every likelihood of a further rapid growth. The only discord developed in the proceedings came as an echo of last year's clash of interests of nurserymen on one side and fruit growers on the other. Wm. C. Barry, the president, esteemed and beloved by every member, refused a renomination and reëlection for the office, which he has filled so admirably since his father's death, except on the condition that the Society drops all further discussion of the matter of legislation concerning the fumigation of nursery stock before its delivery to the planter. Mr. Barry has seldom made a serious blunder in presiding over the Society; but whether his course in this affair was altogether the wisest he could have taken, is open to question. It seems that a committee, properly appointed, and which has spent $500 the past year, should have a chance to report, even if the further discussion of the matter is dropped.

A PEAR BLIGHT.—Albert Wood's paper treated on a new form of Pear blight, which Prof. Johnson, of Maryland, considers identical with the blight so prevalent in Kieffer orchards in Maryland and other southern points. The first symptoms are seen in a peculiar metallic luster of the foliage, or portions of the foliage, and in an affection of the bark on the southeast side of the tree's body. Mr. Wood has tried to check the spread of the disease by spraying with Bordeaux Mixture and whale-oil soap. Prof. Johnson states that they have been able to save the tree on appearance of the first symptoms by banding the tree body after the bark has been scraped off, with cotton and soaking this in a two-per-cent solution of formalin or formaldehyde. Prof. Beach, on the other hand, is by no means satisfied that the blight observed by Mr. Wood is the same as described by Prof. Johnson, and thinks it may be a new manifestation of an old disease, something similar to the Apple canker, a parasitic fungus which finds ingress through the bark, and is slow acting, not likely leading to the death of the tree.

THE ARSENITES.—It seems strange that an apparently so valuable insecticide, as green arsenite, after being advertised and spoken of for some years, should have found so few willing experimenters that only two or three in the large congregation of horticulturists were willing to report on it. Prof. Beach states that green arsenite is a definite chemical compound, but that green arsenoid, under which name it is now being offered, is simply a trade name for a private mixture. He speaks well of green arsenite, however, as being lighter than Paris-green and more easily kept in suspension. Mr. Mann, of Niagara County, used 25 pounds of the arsenoid in 1899 with very satisfactory results, but found the same compound less reliable in 1900, when he used 100 pounds. The writer has used green arsenoid last year for the Potato beetle and slug, and some other insects, with so much satisfaction that he would always use it in place of the heavier Paris-green, with its irrepressible tendency to settle to the bottom, if assured of the same quality as the 1900 sample. Mr. Treadel, of Ontario, tells of white arsenic, which he can buy at six or seven cents a pound, and which, if used properly, does not seem to burn the foliage of trees. J. S. Woodward favors arsenate of lime or soda, as being just as good as Paris-green, and much cheaper. Soda is more soluble, lime a little cheaper. Mr. Bogue says he first cuts his arsenic with potash before adding it to the other mixtures.

SOD OR CULTURE.—The question from the question box, "Why are apples larger and higher-colored on trees in sod than on cultivated trees?" brought a revival of the old discussions on the value of cultivation. Mr. Hooker admits the fact of apples in sod being of higher color, but not of being larger. With the heavy foliage and the full fruiting of cultivated trees, the apples on the under side were green as grass. In sod, the trees have made slower growth, had less fruit and less foliage, and consequently the apples were of higher color and better keeping quality. Notwithstanding this, he is not in favor of sod. Mr. Woodward is again provoked to come out in favor of pasturing apple orchards with sheep—sheep enough to keep the ground bare as a floor, and to be in need of feeding—and sees better results from this way of managing the orchard than from the best of cultivation. J. H. Hale, in a later discourse on peaches, however, demolished the sod theory by asking: "Can you name any crop one can grow that will do better without than with good culture, or any crop that you can hurt by too much cultivation?"

POINTS ON VARIETIES.—That was a happy illustration given by Prof. F. A. Waugh when he stated that the selection of varieties is like matrimony. You may pick out a wife, but it is very questionable whether all the neighbors would wish to make the same choice. It is really so with varieties of almost all fruits and vegetables. Everyone has his special favorites and varieties which he can manage better than other varieties. Only two grape varieties were named in answer to the query: "What is the best early grape, considering hardiness, productiveness and quality?" They were Green Mountain and Worden. Prof. Waugh has experimented with the Abundance plum, and finds that under ordinary circumstances it is not self-fertile. In especially favorable locations or weather conditions it may sometimes bear when standing alone. Mr. Hale says that the time to trim peaches is whenever you get ready, but he prefers the period from February until the buds begin to swell. According to Mr. Hale, the white-fleshed peaches are best for eating purposes, the yellow ones for canning. For home use, he would plant Mountain Rose, Champion, Oldmixon, Stump, and Fox, which will cover a peach season of seven weeks.

When slaking lime for Bordeaux Mixture Prof. Beach says his practice is to pour a little water on the lime, then gradually adds more in moderate quantities, enough to prevent the burning of the lime, but not so much as to drown it. He wants a creamy paste, and to keep this covered with water until used.

ACME PULVERIZING HARROW

To be returned at my expense if not satisfactory.

The best pulverizer and cheapest **Riding Harrow** on earth. We also make walking Acmes. The Acme crushes, cuts, pulverizes, turns and levels all soils for all purposes.

Made entirely of cast steel and wrought iron—**indestructible.**

Catalog and Booklet, "*An Ideal Harrow,*" by Henry Stewart, mailed free.

Free on board at New York, Chicago, Columbus, Louisville, Kansas City, Minneapolis, San Francisco, etc.

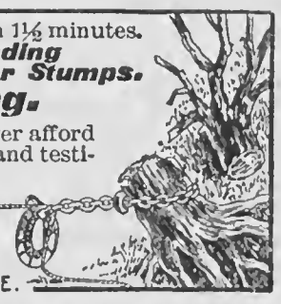
HAWKEYE STUMP PULLER... Pulls an ordinary grub in 1½ minutes. *Pulls either standing Timber or Stumps.*

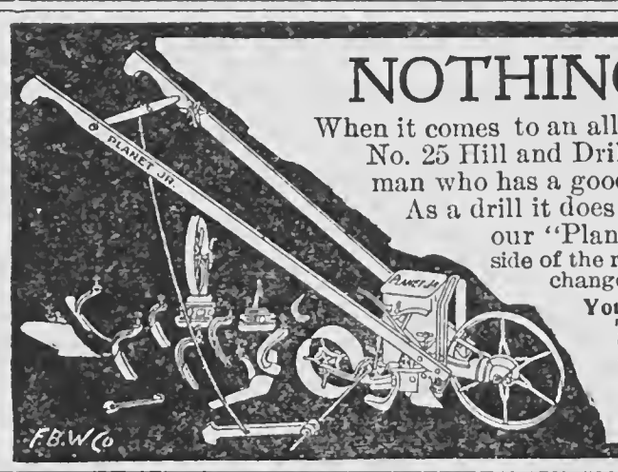
Makes a Clean Sweep of Two Acres at a Sitting.

A man, a boy and a horse can operate it. No heavy chains or rods to handle. You cannot longer afford to pay taxes on unproductive timber land. Illustrated catalogue FREE, giving prices, terms and testimonials, also full information concerning our **I. X. L. Grubber, Iron Giant Grub and Stump Machine, 2-horse Hawkeye** and other appliances for clearing timber land.



MILNE MFG CO., 860 8th ST. MONMOUTH, ILL. ADDRESS MILNE BROS. FOR SHETLAND PONY CATALOGUE.

NOTHING CAN COMPARE WITH IT.



When it comes to an all-round handy and useful garden tool, nothing compares with this "Planet Jr." No. 25 Hill and Drill Seeder and Double Wheel Hoe, Cultivator and Plow. It is made to fit the man who has a good sized garden, yet not quite enough to justify owning a separate wheel hoe. As a drill it does all our famous "Planet Jr." No. 4 does. As a wheel hoe it is identical with our "Planet Jr." No. 12. Has 11½ in. wheels, cultivates between the rows, or on each side of the row, throws dirt to or from the row, hills up, plows, marks out, etc. Easily and quickly changed from one to the other. We give this tool the strongest possible recommendation.

You should have one of the 350,000 copies of our new 1901 catalogue. It is better than ever. Tells all about our full line of Seed Drills, Wheel Hoes, Horse Hoes, Cultivators, Harrows, Two Horse Cultivators, Sugar Beet Seeders and Cultivators, and our reduced prices for 1901. Illustrates by photographic views how they are used at home and in foreign countries. We mail them free.

S. L. ALLEN & CO., Box 1107V, PHILADELPHIA, PA.

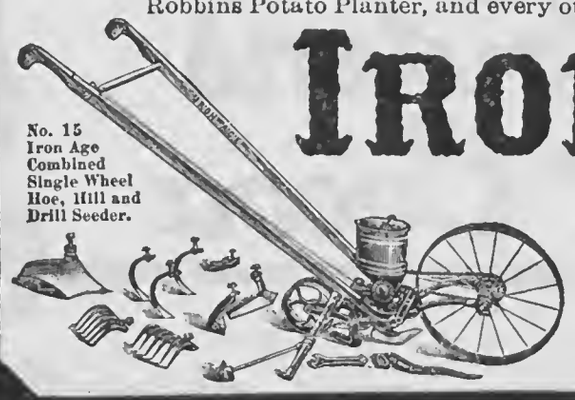
Coax a Crop the Right Way

Thousands who have used the **Iron Age** implements will tell you that every one is an investment that never fails to pay. Since our works were established in 1836, every year has shown progress. We have steadily improved our Seed Drills, Wheel Hoes, Riding Cultivators, Horse Hoes, Cultivators, Improved Robbins Potato Planter, and every other one of the



No. 15 Iron Age Combined Single Wheel Hoe, Hill and Drill Seeder.

IRON AGE Farm and Garden Implements

Iron Age Pivot Wheel Cultivator.

A new implement this year, and a wonder, too, is the new **No. 15 Iron Age Combined Single Wheel Hoe, Hill and Drill Seeder** which combines the best seed drill and single wheel hoe ever produced. Each is complete in itself; they combine with perfect unity and can be changed instantly from one to the other. This excellent tool fills every need in handling seed and soil. It places the seed in hills or drills, plows, rakes, opens furrows, covers, hills, hoes and cultivates. All the **Iron Age** labor savers are fully described in the new **Iron Age Book**, which every successful farmer should keep within reach. **It's free.** WRITE TO-DAY.

Woman and Home

From Day to Day.

Should some great angel say to me to-morrow,
"Thou must retread thy pathway from the start,
But God will grant, in plty, for thy sorrow,
Some one dear wlsh, the nearest to thy heart."

This were my wish: from life's dim beginning
Let be what has been! wisdom planned the whole;
My want, my woe, my errors, and my sinning,
All, all were needed lessons for my soul.
—Ella Wheeler Wilcox.

*

DR. Wiley, of the Department of Agriculture, has this to say about domestic economy:

The health and happiness of our people depend more upon the kitchen than they do upon women's rights conventions, equal suffrage socleties and mothers' congresses. If pure foods, well cooked and well flavored could be placed upon the tables of every dining-room in the United States today, the death rate of our people would be decreased, their happiness secured and the divorce courts be freed of a large portion of their burdens.

*

A SUBSCRIBER in Louisiana asks for a recipe for entire wheat bread. One pint milk, scalded and cooled, one tablespoonful sugar, one teaspoonful salt, one-half cupful yeast, about five or six cupfuls whole wheat flour. In the morning mix in the order given, and knead until smooth and elastic. Let rise till light, about twice its bulk, shape into loaves, allow it to rise a little longer, and then bake a little longer, and in an oven not quite so hot, as for white bread. Whole-wheat bread rises more than white bread, because the flour contains more gluten. Sometimes we make a sponge with white flour, in the same proportion as for ordinary bread, and then thicken and knead with the entire-wheat flour.

*

CHENILLE boas are one of the newer neck-dressings this Winter; they are much more becoming than the plain ruche of Liberty silk, the chenille making a very becoming velvety frame for the face. The full silk ruche is edged with chenille and the ends in front are long clusters of the same material, which fly about like the snaky tentacles of an octopus. Sometimes they are long enough to reach the knees, and are slightly knotted together. It is quite possible to freshen a partly-worn ruche of Liberty silk or mousselaine de soie by edging it with chenille and putting the long chenille ends in front. Black is, of course, the favorite for street wear, but for evening use the chenille boas are seen in all sorts of delicate colors.

*

LAST Summer a domestic-science expert at the University of Chicago published conclusive tables showing how a family might live and grow fat on an allowance of $1 a week for table expenses. These dietetic theories were carefully studied by an economical citizen of Chicago, who sought to introduce a 15-cent-a-day bill of fare into his own family. The results were not what the college expert expected. The housekeeper, perhaps unscientific, was unable to keep within the prescribed limit, and the family disputes that ensued had to be settled by the neighbors and the police, the ultimate outcome being the removal of the frugal citizen to a dungeon cell, while his family was fed by the neighbors. We hardly feel competent to sort out a moral to fit this particular case, but it would seem wise to remind domestic experimenters that all great reforms work slowly. One of our friends is at present studying the arrangement of a succulent and satisfying dinner for four persons, to cost 60 cents in all. When we last discussed it he had decided on pork and beans, but felt uncertain as to a soup, a salad, and a dessert to be supplied within the limit, he being of the masculine persuasion, and somewhat inexperienced in household affairs. What do our readers think about it? Do you ever figure the exact cost of the family meals?

*

THE Chrysanthemum bow is now a favorite hair ornament. It is a fat, bunchy pompon of narrow ribbon, composed of innumerable loops, with four swallow-tailed ends standing up among them. Both gauze and satin ribbons are used, the much-worn velvet being a little too thick for this bunchy bow. Black or

3710 Blouse with Aiglon Stock.
32 to 40 in. bust.

white are the favorites, though colors are also called for. Alsatian bows are also revived, some being quite small, while others are almost large enough for evening bonnets, sometimes with a flower or two tied in the loop. The little velvet bows with upstanding loops are becoming to most women, but they have been vulgarized by those who insist upon wearing them all day, both in the house and at business, whereas any hair ornament over and above pins and combs must be regarded as part of a ceremonious toilette, and therefore only suitable for evening. Ornamental combs or pins are permissible, so long as not too showy, because they are necessities, whereas the bow is a superfluous ornament.

The Rural Patterns.

The blouse made from the ready tucked silk, mousseline, cashmere or other fancy material is much in vogue, and has the great merit of requiring the minimum of labor. The model illustrated is designed to meet just such a need, and includes the fashionable Aiglon stock and the deep girdle, both of which features are found in the best imported models. As shown the foundation is taffeta in biscuit color, the flaring portion of the stock velvet in the same shade, the collar white Liberty, and the tie of black velvet. The girdle is of the same material as the waist, and is held by handsome gold buttons, while tiny ones are used in the flaring portion of the stock. All-over lace, net and all the list of similar materials are suitable, or any soft woolen stuff can be tucked before cutting, if preferred. The foundation for the blouse is a fitted lining that should be well boned, but the waist proper includes shoulder and under-arm seams only. Both lining and outside material close at the center front, but separately, and the opening in the waist is rendered invisible by the tucks. The girdle is fitted to the figure and held in place by short bones, and the blouse drops slightly over the top. The sleeves are cut with broad upper and narrow under portions, and are finished with circular cuffs that flare becomingly over the hands. The Aiglon stock includes the plain portion that fits the throat, the flaring sides and the tie, and is finished separately from the waist. If desired, the plain portion only can be used, or the stock can be made of a contrasting color and worn with various waists. Black and white, white and gold, and many other combinations are worn, and as the stock itself is an up-to-date feature it can be made to do the double duty of finishing the blouse and serving as a separate pattern to be used with other waists. To cut this blouse for a woman of medium size 4⅛ yards of material 18 inches wide, or 2½ yards 32 inches wide, with ¼ yard of bias velvet and ¼ yard of silk for flaring portion of stock and tie, will be required. The pattern No. 3710 is cut in sizes for a 32, 34, 36, 38 and 40-inch bust measure; price 10 cents from this office.

WE cannot excuse the gloomy and sad-faced Christian. If he be one of Christ's followers the spirit of Jesus, of love and trust toward God, will make all life cheerful, and move his heart to perpetual songs of praise and thanksgiving.—Thomas Hill.

Rural Recipes.

The vulture eats between his meals,
And that's the reason why
He very, very rarely feels
As well as you and I.
His eye is dull, his head is bald;
His neck is growing thinner;
Oh, what a lesson for us all
To only eat at dinner.
—From "A Bad Child's Book of Beasts."

Spanish Hash Pie.—Prepare pie paste in the usual manner, cut into large round cakes size of a large plate. Have in all about four. Place a tablespoonful of lard in a frying pan, fry the cakes one at a time on both sides, spread each rather thick with cooked hash. Cut the pie in the usual way and serve at once.

Paprika Chicken.—This is a favorite Hungarian dish, appetizing at all seasons, but especially in the Summer, when the appetite is languid. Cut a nice tender chicken into pieces as for a fricassee; flatten a little, such pieces as need it. Season each piece with salt and pepper, and dredge it lightly with flour, while you fry a minced onion in two tablespoonfuls of butter. Lay the chicken in the butter and onion, cooking for 20 minutes, so it will be evenly and thoroughly done. Take up the chicken and stir an even teaspoonful of salt and a very scant teaspoonful of paprika, or half a scant teaspoonful of good mild cayenne pepper of any kind. Add last of all a cupful of rich cream. Make some dumplings of a pint of sifted flour, two teaspoonfuls of baking powder, a saltspoonful of salt and butter the size of half an egg; moisten the dumplings with a cupful of milk, and drop them over the sauce. Let them cook well, covered for 50 minutes, when they will be well puffed up and light. Pour the sauce around the chicken and make a circle of the dumplings. If the dumplings are steamed over the cream sauce so they do not sink into it they will be lighter.

Potato Pancakes.—These are favorites with our German friends. One egg, three cupfuls of grated potatoes, three tablespoonfuls of flour, three-quarters of a teaspoonful of salt, one scant cupful of sweet milk. Mix well and fry in a spider in one-half inch of fat. These cakes should be a rich brown. Serve with syrup.

Apple Kisses.—Select six small, smooth apples. Pare, cut in half and remove the core. Mix one-half a cupful of sugar with one-third cupful of butter. Place this mixture between the halves of the apples. Place in a baking dish with a little water and a teaspoonful of vanilla extract. Bake till apples are soft. Serve with their own juice for sauce.

Crackling Dodgers.—Scald one pint of cornmeal with one scant pint of sweet milk in which has been dissolved one teaspoonful of salt. Add one cupful of cracklings, mix well, cover and let get nearly cold; then add two beaten eggs. Now wet the hands and pat the dough into little "dodgers." Bake in a well-greased biscuit pan until a rich brown.

Baked Spanish Onions.—This is a good supper dish at this season. Select three large-sized onions; peel and cut them up and down into slices about quarter of an inch thick; sprinkle each slice on both sides with a pinch of salt and pepper. Melt one ounce of butter in a baking dish and place in this the seasoned slices of onion. Bake half an hour.

Cocoanut Snaps.—Grate and dry the cocoanut in the oven. Do not brown it. When dried use 1½ cupful of it. Cream one ounce of butter, one ounce of lard, a pinch of salt and one cupful of sugar together, then add the stiffly-beaten whites of two eggs. Next stir in two tablespoonfuls of the cocoanut milk, 1½ cupful of cocoanut, a teaspoonful of vanilla and lastly eight ounces of sifted flour in which one teaspoonful of baking powder has been mixed. Knead as little as possible and use additional flour to roll out with. Flour the board, roll out a small quantity at a time, roll very thin and cut with a round cutter. Place in a greased baking pan about three-quarters of an inch apart, first sprinkling cocoanut on top of each cake. Bake in a hot oven. Put in an airtight tin box when perfectly cold.

MOTHERS.—Be sure to use "Mrs. Winslow's Soothing Syrup" for your children while Teething. It is the Best.—*Adv.*

Storiettes.

An Accurate Comparison.

"An old countryman I used to know when I was living in south Georgia," remarked a college professor apropos of sudden changes in the weather, "was in at least one respect a very remarkable character. To a casual listener he appeared to be a fluent and unconscionable liar, yet when you came to scrutinize any of his statements closely it was impossible to catch him in the slightest deviation from the truth. One day in early Spring we had an unusually severe fall of hail, and next morning while driving down the road with a friend we happened to encounter the old fellow at his gate. 'Well, Uncle Bob,' I said, that was a pretty bad hailstorm we had yesterday.' 'I should say it was,' he replied. 'You just oughter seed some of the stones that come down in my back yard.' 'How big were they?' I asked. 'Bout as big as watermelons,' said he. 'Well, we've caught him in a whopper at last,' chuckled my friend as we drove on. 'No, we haven't,' I groaned. 'As usual the old rascal has secured all the advantage of a fine, large lie and at the sime time has adhered rigidly to the truth. Look at that vine.' An early watermelon vine was festooning the roadside, and here and there it was studded with minute green spheres about the size of gooseberries. My friend made no comment. I never tried to catch Uncle Bob again."—Boston Beacon.

Neighborly Kindness.

Mrs. Potter is a woman of sterling worth and simple piety, but she has a way of expressing her opinions which sometimes gives offense to sensitive people. A neighbor's daughter, an excellent but unusually plain young woman, was about to be married, and Mrs. Potter went to see her a few days before the wedding.

"Well now, Mary Ann," said Mrs. Potter, as she sat looking at the bride-elect, "it's a good thing you and James have decided not to wait any longer. Both of you are getting on, and besides that, nobody knows when a man may be turned aside from the path of duty by a pretty face. What is your wedding gown to be, my dear?"

"White silk," responded poor Mary Ann, endeavoring to look comfortable.

"Ah, my dear, white's pretty trying, I think," said Mrs. Potter, faithfully, "though of course it's common for brides to wear it, and all things considered, looks don't matter much in your case. Of course James realizes that the Lord doesn't judge by outward appearances, and he's chosen the better part and decided to do the same."

"Yes'm," said Mary Ann, with due meekness.

"And besides," added the comforting visitor, with a smile of great benevolence, "if you were to wear a color, Mary Ann, it would look to any stranger that might happen in to the church as if you'd been married before, and it's better to sail under your own flag at times like this, no matter if 'tis unbecoming, for, of course, you aren't a widow, though there's been plenty of time for you to be."—Youth's Companion.

A GOD-SEND TO ALL HUMANITY.

Remarkable Invention of an Ohioan that Guarantees Perfect Health, Strength and Beauty to Every User, and Cures without Drugs All Nervous Diseases, Rheumatism, La Grippe, Neuralgia, Blood and Kidney Troubles, Weakness, and the Most Obstinate Diseases, by Nature's Method of Steaming the Poisons Out of the System.

Ministers and Those Who Have Used It Declare It to Be the Most Remarkable Invigorant Ever Produced, Better than Any Treatment at Hot Springs, Sanitariums or Health Resorts.

A prominent business man of Cincinnati has invented a Vapor Bath Cabinet that has proven a blessing to every man, woman and child who has used it, and as many of our readers may not know of its real comfort and blessings, we illustrate it in this issue.

Our recent investigation of this remarkable invention was so very satisfactory we have no hesitancy in indorsing the same as just what all our readers need.

It is an air-tight inclosure, a rubber-walled room, in which one comfortably rests on a chair, and with only the head outside, enjoys at home, for 3 cents each, all the marvelous cleansing, curative and

invigorating effects of the famous Turkish, Hot Vapor, Hot Air or Medicated Vapor Bath, with no possibility of taking cold afterwards, or in any way weakening the system.

Hundreds of well-known physicians have given up their practice to sell this Cabinet—such eminent men as Emerson McKay, Detroit, who has already sold over 700, and John C. Wright, Chicago, who sold 125 last month.

Thousands of remarkable letters have been written the makers from users, some of which, referring to

Rheumatism, La Grippe, Kidney Troubles,

will be interesting to those who suffer from these dread maladies. W. L. Brown, Oxford, O., writes: "My father was down in bed for months with rheumatism; this Cabinet did him more good than $50 worth of drugs. It cured my brother of neuralgia and sleeplessness, with which he had long suffered, and his wife of la grippe in one night." G. M. Lafferty, Covington, Ky., writes: "Was compelled to quit business a year ago, being prostrated with rheumatism and kidney troubles, when your Cabinet came. Two weeks' use cured me; I have never had a twinge since." Rev. George H. Hudson, Okemos, Mich., says: "I gave up my pastorate on account of nervous prostration and lung troubles; my editor so highly recommended your Cabinet, I tried it; from that day I have steadily grown better; am now well; nervousness gone; lungs strong; am a new man." Mr. Simon Tompkins, a retired capitalist of Columbus, O., 1031 Broad St., says: "I am satisfied it saved my life. I was taken down with a hard cold, which developed into a dangerous case of pneumonia. The first Bath relieved me and I quickly recovered. It is far superior to drugs for curing la grippe, colds, inflammation and rheumatism." Hon. A. B. Strickland, of Bloomington, writes that the Cabinet did him more good than two years' doctoring, entirely cured him of catarrh, gravel, kidney trouble and dropsy, with which he had long been afflicted.

Hundreds of Ministers

write, praising this Cabinet. Rev. H. C. Roernaes, Everett, Kan., says: "It is a blessing; made me full of life and vigor; should be in use in every family." Rev. J. C. Richardson, N. Fifth St., Roxbury, Mass., was greatly benefited by its use, and recommends it highly, as also does Prof. R. E. P. Kline, of Ottawa University, who says: "I find it a great benefit. No Christian should be without it." Hon. V. C. Hay, St. Joe, Mo., writes: "Physicians gave me up to die; was persuaded by friends to try this Cabinet, and it cured me. I cannot praise it enough." Rev. Baker Smith, D. D., Fairmont, N. J., says: "Your Cabinet rids the body of aches and pain, and as cleanliness is next to godliness, it merits high recommendation."

Congressman John J. Lentz, Hon. Chauncey M. Depew, John T. Brown, Editor "Christian Guide"; Rev. C. M. Keith, Editor "Holiness Advocate," as well as hundreds of clergymen, bankers, governors, physicians and influential people, recommend it highly.

Physicians are unanimous in claiming that colds, la grippe, fevers, smallpox, consumption, kidney trouble, Bright's disease, cancer—in fact, such

Marvelous Eliminative Power

has this Cabinet that no disease can gain a foothold in your body if you take these hot Thermal Baths weekly. Scientific reasons are brought out in a very instructive little book issued by the makers. To

Cure Blood and Skin Diseases

this Cabinet has marvelous power. Dr. Shepard, of Brooklyn, states that he has never failed to draw out the deadly poison of snake bites, hydrophobia, blood poison, etc., by this Vapor Bath, proving that it is the most wonderful blood purifier known. If people, instead of filling their system with more poisons by taking drugs and nostrums, would get into a Vapor Bath Cabinet and steam out these poisons, and assist nature to act, they would have pure blood, and a skin as clear and smooth as the most fastidious could desire.

The Important Feature

of this Cabinet is that it gives a hot vapor bath that opens the millions of pores all over the body, stimulating the sweat glands, drawing out all the impure salts, acids and effete matter, which, if retained, overwork the heart, kidneys, lungs, and cause disease, debility and sluggishness. Astonishing is the improvement in health, feeling and complexion. The first bath makes you feel like a new being; 10 years younger.

With the Cabinet, if desired, is a

Head and Complexion Steamer

in which the face, head and neck are given the same vapor treatment as the body, producing the most wonderful results; removes pimples, blackheads, skin eruptions, cures Catarrh, Asthma and Bronchitis.

O. C. Smith, Mt. Healthy, O., writes: "Since using this Cabinet my Catarrh, Asthma and Hay Fever, with which I have been afflicted since childhood, has never returned. Worth $1,000 to me. I have sold hundreds of these Cabinets. Every one was delighted. My wife finds it excellent for her ills."

Whatever

Will Hasten Perspiration

every one knows is beneficial, but other methods are crude and insignificant, when compared to the convenient and marvelous curative power of this Cabinet, known as the new 1903 style

Quaker Folding Thermal

Bath Cabinet. We find it to be a genuine Cabinet, with a real door, opening wide, as shown in cut. When closed it is air-tight; handsomely made of best, most durable, water-proof goods, rubber lined. A heavy steel frame supports it, making it a strong and substantial bathroom within itself. It has top curtains; in fact, all the latest improvements.

The makers furnish an excellent stove with each Cabinet, also valuable recipes and formulas for medicated baths and ailments, as well as plain directions. It folds flat in 1 inch space, when not in use; easily carried; weighs but 10 pounds.

People don't need bathrooms, as this Cabinet may be used in any room, and bath tubs have been discarded since this invention, as it gives a far better bath for all cleansing purposes than soap and water. For the sick room its advantages are at once apparent. There have been

So-Called Cabinets

on the market, but they were unsatisfactory, inconvenient, simply cheap, flimsy affairs.

After investigation we can say the Quaker Cabinet made by the Cincinnati firm is the only practical article of its kind, and will last for years. It seems to satisfy and delight every user, and the

Makers Guarantee Results

They assert positively, and their statements are backed by a vast amount of testimony from persons of influence, that this Cabinet will cure nervous troubles, Debility, Purify the Blood, Beautify the Skin and Cure Rheumatism. (They offer $50.00 reward for a case not relieved.) Cures the most obstinate cases of Women's Troubles, La Grippe, Sleeplessness, Neuralgia, Malaria, Headaches, Obesity, Gout, Sciatica, Eczema, Scrofula, Piles, Dropsy, Blood and Skin Diseases, Liver and Kidney Troubles. It will

Cure the Worst Cold

with one bath, breaks up all symptoms of La Grippe, Fevers, Pneumonia, Consumption, Asthma, and is really a household necessity. Gives the most

Cleansing and Refreshing Bath

known, and all those enjoying health should use it at least once or twice a week, for its great value is its marvelous power to draw out of the system all impurities that cause disease, and for this reason is truly a Godsend to all humanity.

HOW TO GET ONE

All our readers who want to enjoy perfect health, prevent disease, or are afflicted, should have one of these remarkable Cabinets. Space prevents a detailed description, but it will bear out the most exacting demand for durability and curative properties.

Write the only makers, The World Mfg. Co., 2821 World Building, Cincinnati, O., and ask them to send you their valuable illustrated Book FREE, describing this invention and these remarkable Baths. The price of the Cabinet is wonderfully low, only $5.00, complete, with heater, directions and formulas; also Prof. Gering's No. 2 Guide Book, health and beauty, free. Head attachment, if desired, $1.00 extra, and it is indeed difficult to imagine where one could invest that amount of money in anything else that guarantees so much health, strength and vigor.

DON'T FAIL TO WRITE TO-DAY

for full information; or, better still, order a Cabinet; you won't be disappointed, as the makers guarantee every Cabinet, and agree to refund your money after 30 days' use if not just as represented.

We know them to do as they agree. They are reliable and responsible; capital, $100,000.00.

The Cabinet is just as represented, and will be shipped promptly. You can remit safely by express, P. O. money order, bank draft, or certified check.

Don't fail to send for booklet, any way.

$150 a Month and Expenses.

This Cabinet is a wonderful seller. More than 20,000 were sold last month by agents, and the firm offers special inducements to both men and women upon request, and to our knowledge many are making from $100 to $150 every month, and expenses. Don't fail to write them.

MARKETS.

REVIEW AND OUTLOOK.

BUTTER trade is dull. Receipts of all but extras are large. There is but little call for June creamery, and the same is true of State dairy. Exporters are handling a little factory at 13 cents or under.

DRESSED POULTRY.—Receipts are liberal and the demand slow. The only scarcity is in fancy chickens and small hen turkeys. The proportion of coarse chickens and ordinary fowls is large, and they are not wanted. The stock of capons is also large, and in light request at 13 cents for the top figure.

FRUITS.—Apples are not selling very well, but holders of extra cold-storage goods express considerable confidence in the future of the market. Since the holiday rush was over, cranberry trade has been dull. The Florida strawberries received are inferior, having a good many green spots, and the price has dropped to 25 to 30 cents.

BUSINESS BITS.

IF you have choice hothouse lambs for sale, write Archdeacon & Co., 100 Murray St., New York.

ON January 14 the plant of E. W. Ross Co., Springfield, O., was partially destroyed by fire. Our readers are familiar with this firm as the manufacturers of the famous Ross feed and silage cutters. Arrangements have been made to rebuild, and all orders will be promptly shipped.

FOR 25 years the Roderick Lean Manufacturing Company, of Mansfield, O., has been making nothing but harrows and land rollers, giving its whole thought and attention to the production of the finest harrows and land rollers that it is possible to produce. We would recommend anyone interested in harrows and rollers to write to the Roderick Lean Company for their catalogue and further information.

THE smoke house always was a source of worriment, vexation and expense. When it catches fire let it go up in smoke. There's a better way to smoke meats. That is by using Krauser's Liquid Extract of Smoke. It is made from selected hickory wood. It is applied to meat with a brush or sponge. It contains the same ingredients that preserve meat that is smoked in the old way. It gives meat a delicious, sweet flavor and gives perfect protection against insects and mold. It is cheaper and cleaner than the old way. Information concerning its use, cost, etc., can be had by writing to the makers, E. Krauser & Bro., Milton, Pa.

THE friends of the Page Woven Wire Fence Co., of Adrian, Mich., will learn with great satisfaction of the company's being recapitalized at $1,000,000, every dollar paid in, and every share sold. The receivers have been discharged, and the company is again in possession of its entire property which includes the steel, rod and wire mills at Monessen, Pa., and its original Adrian plant. The management is not materially changed. The capacity for weaving fence will be quite largely increased, and the company hopes to be able to supply the Spring's demand as fast as it is called for. It seems as though the farmers and stockmen were really standing by them in their endeavor to furnish a fence not made by a trust.

A "WATCH" DOG.—The following story is told of a Brooklyn dog: The Rev. William Tappan, who conducts a mission in South Brooklyn, has an ugly bulldog named Watch which usually goes to church with his master and sits outside until the service is over. At Friday evening prayer meeting Mr. Tappan took for his text a portion of Scripture beginning with the word "Watch." As he announced the text the dog pricked up its ears. At a second and emphatic repetition of the text the bulldog dashed up the aisle and springing into the pulpit, jumped all over his master, interrupting the sermon until the animal was led outside of the chapel and tied.

COLLEGE AGRICULTURE.—In speaking of the advantages of the farmers' short course at the Kansas College (Manhattan), these statements are made:

"The college purchased half of a farmer's herd of hogs, taking a fair average of the lot. We fattened these hogs in 50 days, while the farmer, doing the best he could, marketed his in 110 days. We spent less for feed and had risk from disease for less than half the time. By feeding Alfalfa hay with grain to fattening hogs the college secured 868 pounds of pork per ton of hay fed. It pays to know what type of animal gives best results for feed consumed. In 1898 a scrub cow of the dairy type gave the college milk worth $40.37 above cost of the feed, while another scrub not of the dairy type yielded milk during the year worth $6.25 less than her feed."

COW PEAS IN OSWEGO CO., N. Y.—We use the Black and Whippoorwill. The results were not all we could hope for, but I shall try them further next year. They have done best for us on loose open soil; on clay soils their growth has been very poor. Our climate is moist and cool during the growing season, owing to lake influences—a condition probably not congenial to cow peas. A point against them as a cover crop for orchards is their tendency to go to pieces after frosts, and hence fail to give the soil the necessary protection against hard freezing. C. B. C.

Michigan.

R. N. Y.—By sowing the cow peas in drills we are able to sow rye in the Fall and thus secure a Winter covering. We have never recommended cow peas for rich land. They are best on light, open soils—the poorest parts of the farm.

CATARRH CAN BE CURED.

Catarrh is a kindred ailment of Consumption, long considered incurable; and yet there is one remedy that will positively cure catarrh in any of its stages. For many years this remedy was used by the late Dr. Stevens, a widely noted authority on all diseases of the throat and lungs. Having tested its wonderful curative powers in thousands of cases, and desiring to relieve human suffering, I will send free of charge to all sufferers from Catarrh, Asthma, Consumption and nervous diseases, this receipe, in German, French or English, with full directions for preparing and using. Sent by mail by addressing, with stamp, naming this paper, W. A. Noyes, 847 Powers Block, Rochester, N. Y.

WE'LL PAY THE FREIGHT and send 4 Buggy Wheels, tire on, for $7.25. with axles welded and set, $10.60. All sizes and grades, ⅞ to 4 in. tread, steel or rubber tires. Write for catalogue giving instructions for ordering and how to obtain a Wagon Umbrella Free. Rubber tired Buggies $58. Buggy Tops $5.65. No. 2 Wheels for repair work, $5.50. Order at once to get these prices. W. R. BOOB, Center Hall, Pa.

Costs One Cent

to learn how to make DOLLARS. Our 20th Century catalogue will give you full information. Greatest weight, twice the strength, and three times the lasting quality of ordinary wire fencing.
The Frost Wire Fence Company, Cleveland, O.

Warehouse: 81-83 John Street,
NEW YORK.

Market Briefs.

PICKED UP HERE AND THERE.

A HANDY SIGN.—West Side banana and some other fruit men have a novel scheme for making a sign that is cheap and attracts attention. They take a large paper sack or ordinary white grain bag, stuff it full of hay, paint the name of whatever specialty they have for sale on the outside, and hang it up beside the door, or over the sidewalk from the awning frame or permanent roof. It can't fail to draw attention, and is easily renewed if any changes are required.

OLD CANE FOR SALE.—A man came into this office with a real curiosity in the shape of a heavy oak cane with a carving representing a snake wound around it. His story was that it was brought over from England in 1754, used by George Washington for a time, and, after being hidden away for about 100 years, had come into the possession of the present owner. No doubt it was an old timer, and he was probably sincere in his story, but the absence of any definite proof made it worthless as a relic. If an affidavit signed by George Washington and attested by some Virginia notary had been attached, it would have been different. He had tried to dispose of it to museums and other curiosity places, but without success. Also he had made a mistake by having it cleaned and varnished, and putting a new gilded head in place of the horn handle. Old things should be left in the condition in which they are found. Buyers do not wish them to look new. It is enough to wipe off the dust and dirt. The same applies to old coins. It is a mistake to clean them with chemicals.

MUSIC AND PHILOSOPHY are served up with lunch in a little eating house on Chambers Street in this city. The building is a three-cornered wooden affair, about 12 feet long and six feet across in its widest part, stuck in an angle formed by two other buildings. The customers sit on stools in front of a shelf, and, as it is on a busy street, a surprising number of people eat there every day. Truckmen, who have to be out long before daylight in Winter, stop a few minutes for coffee and a sandwich as an addition to the early breakfast they had at home; and it is so handy that dozens of people who are away from their usual lunching place and feel hungry, stop for a few minutes. The place is kept by two men, one about 60, and the other 20. In the evening, when the young man is in full charge and there are few customers, he gets out his violin, and hauls Beethoven, Bach, Mendelssohn and others over the coals. Yankee Doodle and such things are beneath his notice, and he has no use for music that is not well peppered with notes having three or four or more ears on a stalk. The other partner is not much on music, but is ready to tackle anything in the line of politics, philosophy, social matters, religion, or current events. Having traveled widely as cook on shipboard, and done considerable reading, he has a large amount of information on hand. This he diffuses in an off-hand way upon his customers through one corner of his mouth, the other being used to hold a clay pipe.

SPRING LAMBS.—The season for these commences with Christmas, but comparatively few are received until the middle or latter part of January. These lambs ought to weigh 30 to 35 pounds or more, and there is no use in sending inferior ones to market. Choice lambs that will weigh up to the figure given above are now selling at $9, and the best cuts will cost the consumer anywhere from 40 to 75 cents per pound. One dealer told me that he had received some that weighed less than 20 pounds, and it is very hard to sell them at anything like a fair price. If a lamb is not growing as he ought, a little extra care will often push him along up to the head of the line, whereas if left to fight for himself with the stronger ones, he will always be a runt. In dressing for this market, the feet and head must be removed, in order to comply with a city law. In cold weather it is necessary to cut them open only to the breast bone, but as the weather gets warmer they should be opened nearly to the head in order to prevent them from spoiling. They make the finest appearance when spread wide open with sticks crossing on the back. The whole carcass should be wrapped in clean muslin and then covered with bagging. It will pay to take all this extra care, as the lambs go to high-priced buyers, and the general appearance often makes the difference of $2 or $3 per head. It will not do to send last Summer's lambs with the expectation that they will pass for hothouse animals. Buyers are critical, and an old lamb will sell for just what it is worth and no more.

W. W. H.

I HAVE never fed silage to hogs. I have fed some common Red clover to my brood sows, and was very well pleased. I like it much better than feeding so much corn.

Michigan. O. B. R.

PENNSYLVANIA STATE HORTICULTURAL ASSOCIATION.

The forty-second annual meeting of the Pa. State Horticultural Association was held at Harrisburg, January 21 and 22. The attendance of members was very fair, and many interesting papers were read and earnestly discussed. There was quite an exhibition of apples, which as a rule were highly colored and of excellent flavor. The York Imperial largely predominated, and many really fine specimens were shown. It is to eastern Pennsylvania what the Ben Davis is to the Southwest. It is large, handsome and a good keeper, as grown near its place of origin in York County, Pa., but does not thrive so well in the West and North. Several new seedlings of promise were shown by growers. The fruit exhibited, however, generally showed lack of care in culture and selection. In the discussions following various papers on fruit growing in the State it was brought out that Pennsylvania is now nearly at the foot of the list of fruit-growing States, but that all the commercial fruits can be grown to great perfection under the varying conditions of soil and climate within the State. Pennsylvania apples are noted for their high flavor, and the State produces twice as many varieties as any other. The State should be carefully mapped out to grow quality fruits, as the topography is too diversified for uniform results.

Much interest was shown in promoting legislation for the benefit of fruit growers, and the creation of a Division of Horticulture under the State Department of Agriculture. Bills for this purpose, and for the purpose of eradicating the Pernicious scale and other destructive insects, as well as diseases of trees and nursery stock were read and endorsed for presentation to the Legislature. Prof. W. G. Johnson of the Maryland Experiment Station, on invitation, made an earnest plea for a drastic scale law, such as is now in force in his State, but the Pennsylvanians seem to realize the annoyance and danger of too much officialism in matters concerning cultivators of the soil, and do not care for such a severe law. The spraying of fruit trees and plants was discussed with interest. Mixtures must be freshly made, when old they are dangerous to the plants and difficult to apply. Preparation should be made by pruning and opening up the trees. A half-inch hose is much better than the ordinary ¾-inch size for spraying, as it is lighter and more flexible. The trees must be dry, as moisture renders the spray ineffective. Trees should be open enough to let sunlight through, or a dense spray cannot get through. Winds hinder spraying to some extent, but they cannot be avoided, and a thorough spraying on the windward side will often cover the branches effectively. Spray pumps are handy to have, and may be used for whitewashing and window washing. Spray with a fungicide, like Bordeaux Mixture, before buds open; with fungicide and an insecticide like Paris-green after bloom. Never spray while bloom is open, and do not use arsenicals on stone fruits, as it nearly always injures the foliage. Bordeaux Mixture must be weak if used on stone fruits, as foliage is more sensitive than the apple or pear.

Some root galls were shown, taken from peach and apple trees. It is advised that trees should not be replanted where destroyed by galls, as it seems to be infectious, spreading from one species to another within the family of the Rosaceæ, which includes most of our fruit-bearing plants. Not much interest was shown in a proposed fruit-package law, and the discussion was short. Many interesting papers were read and addresses made on subjects of more local interest. Dr. Edge, for 25 years Commissioner and Secretary of Agriculture of Pennsylvania, gave a most interesting talk on Horticultural Observations on a Tour Around the World. The address was very entertaining, but there was mighty little horticulture in it. Prof. John Craig, of Cornell Experiment Station, gave an address on Decoration of the Home Grounds, illustrated with many fine lantern views. He was followed by Prof. W. G. Johnson, of the Maryland Station, with an extended series of views of the great peach orchards of America. The Association will meet at Bloomsburg next year. All the present officers were re-elected. A review of Dr. Groff's most interesting paper on Fruits and Vegetables of Porto Rico will be given in a subsequent number of THE R. N.-Y.

W. V. F.

STRAWBERRY PLANTS.—Referring to the article on "the new strawberry culture," page 863, I have practiced this method in a modified way for several years, whenever it is not convenient to plant early in the Spring. I find the plants do much better when dug early, as soon as they can be in the Spring, and heeled in as Mr. Farmer deseribes, until such time as the land can be put in good shape for planting, and the weather is propitious. I cut the roots back to three inches instead of four or five, and find that they throw out small roots all along the old ones, which I think is natural for them, as the roots of strawberries spread out instead of going down to any great depth; and, besides, it is easier work setting, same as a close root-pruned tree. Do not set too deep in trench, or keep in trench over three weeks.

W. S. W.

Minnesota.

A NUMBER of farmers in this section have thrashed their corn this Winter. A common thrashing machine is used. By this method the corn is shelled and cleaned, and the stalks shredded. One farmer thrashed out over 100 bushels of shelled corn in 10 hours.

S. E. T.

Shelburne, Vt.

His Wife Insisted

And he thought he'd humor her, no doubt. The result shows that a man rarely loses by following his wife's advice. Those who suffer from obstinate cough, bronchitis, weak lungs and ailments in general which tend to consumption, will find speedy relief and perfect cure in the use of Dr. Pierce's Golden Medical Discovery. It cures ninety-eight per cent. of those who give it a fair and faithful trial. It purifies the blood, heals the lungs and builds up the body with firm flesh instead of flabby fat. The "Discovery" contains no alcohol, neither opium, cocaine, nor other narcotics.

"Only for Dr. Pierce's Golden Medical Discovery I think I would be in my grave to-day," writes Mr. Moses Miles, of Hilliard, Uinta Co., Wyoming. "I had asthma so bad I could not sleep at night and was compelled to give up work. It affected my lungs so that I coughed all the time, both day and night. My friends all thought I had consumption. My wife had taken Dr. Pierce's Favorite Prescription, and it had helped her so much she insisted on my trying his 'Golden Medical Discovery'—which I did. I have taken four bottles and am now a well man, weighing 185 pounds, thanks to Dr. Pierce's Golden Medical Discovery. I would like you to print this testimony as it may help some other poor sufferer."

Dr. Pierce's Medical Adviser, in paper binding, *free* on receipt of 21 one-cent stamps to pay expense of mailing *only*. Address Dr. R. V. Pierce, Buffalo, N. Y.

STEEL WHEELS for your **FARM WAGONS**

any size wanted, any width of tire. **Hubs to fit any axle. No blacksmith's bills to pay.** No tires to reset. Fit your old wagon with low steel wheels with wide tires at low price. Our catalogue tells you how to do it. Address

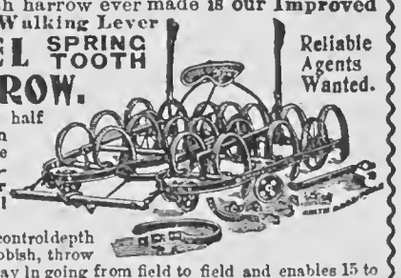
The Lightest Draft

spring tooth harrow ever made is our Improved Riding & Walking Lever

WHEEL SPRING TOOTH HARROW.



Reliable Agents Wanted.

It is fully a half horse lighter in draft than those of ordinary pattern. Suited for all soils for all cultivation. Rachet levers control depth free from rubbish, throw teeth out of way in going from field to field and enables 15 to 18 ins. to be worn from teeth. Guaranteed as to material, workmanship and utility. Handy spring seat for operator. Write for large general Catalogue F, showing our entire line.

HENCH & DROMGOLD, YORK, PA.

Buy This One

and get a Spring Tooth Harrow that is so made that it cannot clog. Each tooth works free from the frame and can gather no rubbish between tooth and frame. It is the lightest strong harrow made. Hinged in the middle, either side may be raised at will to pass obstacles. Every tooth cuts its own track. Nothing better can be put into a harrow than the material used in this "Pensylvania"

Steel Frame Harrow.

Our Malleable Friction Clamp Tooth Holder holds best. No boring or riveting to weaken the tooth. Easily adjusted—single nut. Can adjust to wear 15 to 19 inch of tooth. Adjustable hitch. Lightest draft consistent with good work. Send for large illustrated catalogue of Implements, Engines, Saw Mills and Threshing Machinery.

Live Stock and Dairy

THE TUNIS BREED OF SHEEP.

Mr. Clark Allis, of Medina, N. Y., has been known as a "Dorset man" from his success with the Dorset in producing early lambs. He now wants to be known as a Tunis man, as the last-named breed has finally beaten the Dorsets on his farm. Among other things he says:

"I have about 200 grade ewes, and turned a fine Dorset ram, one year old, and a Tunis ram, three years old, into the flock in May. The Dorset was boss, but when the lambs began to drop most all were Tunis. The best day's work was 10 lambs, and seven were Tunis. The Tunis lambs, both half and pure bloods, are red or spotted, and look like Water spaniel dogs. I went to the lot one night and in the dark I thought I had found a litter of skunks, but it was only six little red Tunis lambs. The best lamb I ever saw (and I have seen several, for I shipped nearly 800 last season) was a spotted Tunis grade we killed December 14, 1900, and its tail was just one chunk of fat after the skin was off, and nearly as big as my wrist. This lamb brought $1 more than the best Dorset. This is the first crop of grade Tunis I have ever seen. The Tunis, both rams and ewes, are very gentle and kind, and at the Brockport Fair, where I showed them, a wool expert said the wool was different from anything he had ever seen raised in this country, like some of the grades that are imported at a stiff price."

Mr. Allis sends some pictures of the lambs which are, unfortunately, too dim to engrave. One picture shows a white lamb with a red skin. The red lamb died—the skin was put on a white one, and the ewe at once accepted the substitute.

NORTHERN CATTLE AND TEXAS FEVER.

As to the proposition of a Michigan reader of THE R. N.-Y., on page 21, to take a herd of Holstein cows into one of the Gulf States with the intention of doing a dairy business in the South, this plan will certainly fail from a business point of view, because almost all of the adult cattle will probably die of Texas fever within the first year. I understand, however, that some dairies in New Orleans are managed successfully by stocking them with northern cows only, and that these are brought down by boat, and never become infected with the germs of Texas fever. This method should not be attempted by one who has not lived some years in the South, and who does not know how to avoid the cause of fever. It occurs to me that your reader's best plan will be to immunize all his animals under two years old, while they are on the farm in Michigan. To do this he should have a southern-raised cow or steer at his farm to supply the infected blood for inoculation. From the jugular vein of this animal draw the blood into a hypodermic syringe of the ordinary pattern, and immediately inject into each of his young cattle one to two cubic centimeters hypodermically. This will cause genuine Texas fever in the animals in about 10 days. The danger of death is not great if the bowels are kept open. The most practical way to do this is to graze the animals on young stuff—say young wheat. Any tendency toward constipation should be promptly met with a pound of salts dissolved in warm water. The attack usually begins about the tenth day after inoculation, and ceases about the eighteenth to twentieth day. Nothing further is noticed until about the thirtieth day after inoculation, when the fever will rise again, and take a course very similar to the first attack. The results of these fevers are several, viz.: loss of flesh, a deadening of the hair, and in some case an arrest in growth.

After some time, say three or four months, repeat the inoculations, using two to five cubic centimeters of blood. This work should be done only when there is green feed available. The animals must be very warmly housed during cold weather, because the fever thins their blood, and they are likely to suffer from severe cold. Having done this, inoculate all the young calves every few months, and they will probably be reasonably safe against the fever contracted in the ordinary way in the South. No danger whatever exists in allowing the animals to associate together on the farm in Michigan. By proceeding in this way your reader could in a few years build up an immune herd, and then he could move South without great interruption in his business. The old cows cannot be moved South to advantage. The Texas and Missouri experiment stations have made a special study of this problem, and their experiments embrace over 2,000 fine cattle, which have been subjected to the process, with a mortality of less than 10 per cent. It is not advised that one who knows nothing of the nature of Texas fever attempt this on a large scale, but he should try a few animals at a time, say 10, and familiarize himself with the disease before going South.

M. FRANCIS,
Veterinarian of the Texas Exp. Station.

DEATH IN PAINTED SILAGE.

I inclose a clipping from the Garrettsville (O.,) Journal that will be of interest, and importance to the readers of THE R. N.-Y.:

The loss to H. B. French from painting the inside of his silo with lead and oil, whereby six of his cows were poisoned and died, is considerable, and may amount to $1,000. His silos contained the product of 15 acres of corn, which will probably have to be removed and lost; will require a large amount of labor, also in scraping off paint. It will be a warning to farmers not to paint the inside of their silos with lead, as the acid takes off the paint and poisons the contents.

Just think of raising and caring for 15 acres of corn, of harvesting and storing in a silo, only to kill his own cows. Just think also of digging out and carting off the remainder of the silage. And yet this man was hardly blamable. He was only using the utmost caution to preserve (as he thought) the inside of his silo, and make it still more airtight. But what a mistake one may make when he thinks he is doing right! It should be a warning to others.

Ohio. A. R. PHILLIPS.

R. N.-Y.—We are sure that the best authorities have again and again advised farmers not to paint the inside of the silo. Some have suggested a smear of gas tar, but lead paint has not been suggested by anyone who has really studied the matter.

FEEDING CANNERY WASTES.—I find the by-products of the canning factory of considerable value. Last Summer we drew many tons of peavines home, and put them in our silo. They tided us over the drought. In the Fall we find that our cattle give fine results on the fresh corncobs and nothing else. We purpose the coming season, if possible, to fill our silos with peavines and use them in the Winter as a substitute for part of the corn silage. We last year had 17 acres of sweet corn for the factory. This brought us $340. We also filled our silo with the stalks, which will feed our herd of 18 cattle for six months. Our crop of corn last year was somewhat shortened by the dry weather.

Auburn, N. Y. F. H. K.

SHREDDED SILAGE.—Replying to C. R. W., regarding the value of cut or shredded corn silage, I find no difference in the feeding value. I have had experience with silos and silage since 1885, and the past two years have used the shredder in filling, and find that my silos will hold more tons of feed than they will with the silage cut. A good point in favor of the shredder is that the silage lies closer and excludes the air better. I find, however, it requires eight horse-power to a shredder to do the same amount of work as six horse-power to a cutter. J. S. W.

Whiteford, Md.

WHEN you write advertisers mention THE R. N.-Y. and you will get a quick reply and "a square deal." See our guarantee 8th page.

Never let a little child's cold "run on." There is sure danger and perhaps death at the end of it. The infantile organs are always helped by Dr. D. Jayne's Expectorant, and the little ones like it.—*Adv.*

Prepared by Dr. Earl S. Sloan, Boston, Mass.

A LIVELY DAIRY MEETING.

Connecticut Cow Owners Meet.

The Connecticut Dairymen's Association has nearly reached its majority. Its twentieth annual meeting was held in Hartford, January 15-16. The attendance was unusually large, and a goodly proportion of those present were young men under 30 years of age, which is an encouraging sign of the times. In his annual address, President J. B. Noble stated that the Association existed solely for the practical side of dairying. Successful field meetings have been held at various farms, and a number of dairy institutes. Market is good for first-class creamery butter, as western competition is not increasing. Many in the West have gone back to beef breeding, as prices have increased, and beef growing is easier than dairying for the lazy farmer. Cost of production must be lowered, but quality must be maintained. There is a good opportunity on the back farms to raise milch cows for the retail milkmen.

John Gould, of Ohio, gave an illustrated lecture, "Does Dairy Temperament Have a Type?" Mr. Gould said that the farmer is better versed in all other live stock upon the farm than he is with the cow, which is expected to make his money. He illustrated his talk by a dozen oil paintings and said that the Connecticut farmer should stop mixing breeds and stick to one breed to get profit out of his dairy. Mr. Gould then gave a descriptive picture of the type of cow that devotes all her energy to the making of beef, and contrasted her with the cow that devoted her energy to the making of butter, which instead of showing a pound of four-cent beef for the feed energy has a pound of butter at 20 cents instead. The best type of dairy cow, said Mr. Gould, is the one that in conformation is harmonious to the running horse. The characteristics of the running horse in conformation were detailed by Mr. Gould, and then with the aid of the paintings he showed these characteristics in the cows which were known to devote their energy and nerve force to the making of milk and butter. Mr. Gould said that he did not champion any breed of cows, but in order to get the required amount of nerve power and energy he thought that the proper cow for the dairy should be bred along Jersey lines. He advocated that the mixing of breeds be stopped. The farmer must stop adding new influences to his herd and endeavor to get the influences in the herd cut down to as few as possible, and have them work in harmony. The farmer should have a special cow for special purposes. He should decide the kind of a herd he wanted and then follow line breeding and stop heterogeneous breeding. If the cow gives 3,200 pounds of milk a year we pay $5 a year for associating with her, but if she doubles the quantity she pays $25 a year for associating with us. The production of milk is the product of the stimulation of nerve force.

Dr. N. S. Mayo, of Connecticut Agricultural College, talked on The Health of Dairy Cows. He emphasized the fact that as the boy is father to the man, so the calf is mother to the cow. We should start with healthy calves, and keep them so. Give them plenty of pure air, plenty of exercise, and keep them in the sunshine. In the words of a popular hymn: "Let the blessed sunshine in." Fresh air and sunshine are the greatest enemies of disease, while darkness breeds disease. Don't breed too young. In reply to a question from Mr. Hoard, Dr. Mayo said that heifers should not calve until three years of age. Gov. Hoard maintained that at that age they were very likely to lose the milking tendency, and to be beefy. Grow up the calves separate from the cows; have a different barn. Most cases of human tuberculosis have been started before 21 years of age. If we can raise the calf and have her perfectly healthy at maturity we are well on the right road. Cows should have separate stalls, and if watered in the barn separate basins. Stables should be thoroughly cleansed twice a Winter with disinfectants, and whitewashed. This in addition to the careful daily cleaning. Cows coming into such stables will think they have a new lease of life. Mangers should separate so that one cow cannot slobber in her neighbor's manger. Separator skim-milk was said to be better for calves than that set in pans. Calves in Connecticut are fed too much, and not often enough.

Dr. Jordan, of the Geneva Experiment Station, gave a sharp, witty address on the Commercial Relations of the Farmer. He showed how the farmer had departed from the days of old, when everything he needed and used was produced on his own farm; he now buys almost everything. This is often to his own detriment. Dr. Jordan said that the farmer should know what he is buying, and its value. Buy on its merits alone, not on testimonials. Don't believe any of them. Have nothing to do with them. He carefully and fully explained the difference between the two great classes of feed by-products; those wherein the residue is a better food than the original grain, such as the gluten meals and feeds, cotton-seed meal and linseed meal, and the foods which are so poor after the parts the manufacturer wishes are taken out. Among this class are the different varieties of oat feeds and feeds using proprietary names. These are fixed up to dispose of some product which could not be sold on its own merits. The basis of many of these is oat hulls. They are having a big sale, but are not worth what they are usually sold for. Better let them alone, as the simple statement of their analysis doesn't represent their contents, and one of these foods may have a fair amount of crude protein, but much protein and carbohydrates that are indigestible. Mixed feeds are also uncertain quantities and liable to contain insoluble refuse from the mills. H. G. M.

BEET SUGAR PULP.—I am not authority regarding the feeding of sugar-beet pulp, as I have never fed it, although only 35 miles from the beet sugar factory. I have given the matter some consideration. I would have to haul the pulp three miles up grade from the railroad, and as the feed contains a great deal of water, there is much objection to doing this. The freight on so much water is also quite an item. It is claimed that silage can be provided for from $2 to $3 per ton. If so there can be little profit in paying $1 a ton for pulp, paying the freight for any considerable distance, and doing a lot of hard, disagreeable work in handling and feeding, to get a feeding stuff of less than half the feeding value of silage. I have no doubt about the profit of feeding the pulp by those who are rightly situated, and whether a person is rightly situated or not he must decide for himself.

H. H. L.

AN ILLINOIS JERSEY HERD.—We have the only Jersey herd in our county, and also the only silos and steam-power creamery. Our herd now numbers 90, young and old. With this herd and the other farm animals, rotation of crops does not trouble us. Feeding our cattle silage with nitrogenous foods in grain, we have the best manure that can be produced, and a large quantity dressed 30 acres last year, and will, no doubt, dress 40 this year. We use a spreader, so we know just what we can do. From 50 acres of corn and sorghum last Fall we put up 400 tons of silage, and enough fodder to run cattle through to grass. We shall have 75 or 100 tons of silage for Summer feeding when dry weather strikes us. While we have our silos for our dairy herd we also use silage for all other stock, and find it a most excellent food—horse barn, pigsty and henyards. We are now wholesaling our butter product at 22 cents; did get 24, but all butters are off in price. Our herd is bred upon the farm. All heifers are kept till they freshen, and tested. None but profitable animals are kept; we sell others to butchers. We find that silage fed to beef animals puts on flesh faster than feeding the usual dry feeds. We feed eight to 12 good Jersey steers each Winter, and even at the reduced price we receive for them they pay well for all foods consumed, and in the event of dressing one for our own use we find them superior to any beef we can buy.

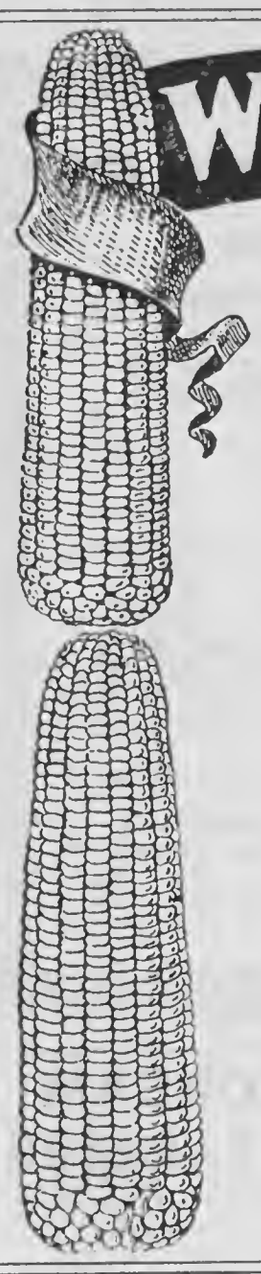
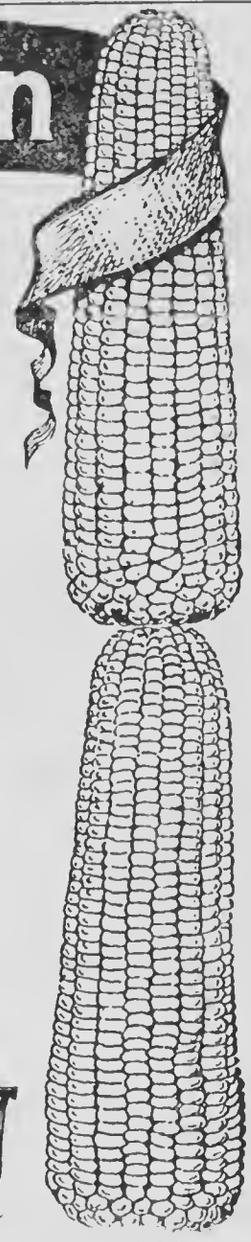
THE NAGLEY MFG. CO., Lyons, N. Y.



Wonderful Crops of Corn



This corn was grown on the farm of H. Kurtz, Stewartstown, Pa., in the driest season known in that section. The only good corn grown in that region was on farms where the "SUCCESS" WEEDER was used. Five average ears of this corn averaged 22 ounces per ear, yield 80 bushels to the acre, and it was cultivated entirely with the "SUCCESS" WEEDER, no other implement of any kind used.

J. R. Stradley of Hiwassee College, Tenn., writes: "I am more than pleased with the weeders bought of you last year and the year before. All those I have sold to are delighted with them. I would not be without one this coming year for $50, and I have been on this farm for thirty-five years but never before made such a crop of corn as I did this season. Thirty wagon-loads of corn in a field that never before went over sixteen loads. In your weeder you certainly have the best implement that goes on the farm. It saves time and makes money."

D. L. Charlton of Vlear's Switch, Va., writes: "The weeder bought of you last April has proved to be everything you claim for it. My fifteen year old boy cultivated twelve acres of corn entirely with the weeder. He would start it to work at 7 A. M., and by 4 P. M. would be over his field. Result, I had the finest crop of corn that I ever raised."

HALLOCK'S "SUCCESS" ANTI-CLOG WEEDER AND CULTIVATOR

will cultivate more corn and do it better than any other implement. For harrowing, pulverizing, weeding or cultivating, it saves cost of labor, does more and better work than anything else in the implement line. More than 50,000 delighted farmers have put money in their pockets by using Success Weeders. *Write to-day for all the facts and what those farmers say.*

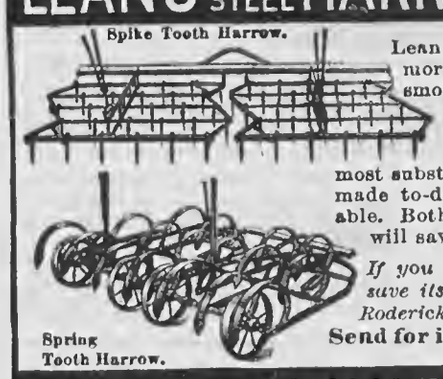
LEAN'S ALL STEEL HARROWS AND LAND ROLLERS



Spike Tooth Harrow.

Lean harrows make fat harvests. They do more work and do it more efficiently than any other harrow. They tear up the ground, smooth it for sowing, harrow in the seed, kill the weeds after the crop comes up. The teeth are adjusted to suit any condition of the soil. By a touch of a lever they are instantly cleared of trash without stopping the team. The most substantial and finest finished farm implements made to-day. Made entirely of steel, light and durable. Both the spiked tooth and spring tooth harrow will save enough in a year to pay for itself.

If you want a Land Roller that will save its price in a single season, get a Roderick Lean Steel Land Roller.

Send for illustrated catalogue to-day.

ESSENTIAL PRINCIPLES OF PLANT GROWING

THE BABY TOMATO VINE AT SCHOOL.

Water and Air in its Education.

FIRST REQUIREMENTS.—The essential features in growing early vegetable plants, such as tomato, pepper and egg plants under glass, as I see it after nearly 20 years' practical experience, are as follows: First, location of the beds; after several changes I have found that a moist bottom, with natural or artificial wind-break (natural preferred) is the most desirable place to set the frames. Second, seed is of vital importance. Be sure you have good seed of whatever plant or variety you wish to grow, and this is best obtained by selecting your own from the ideal plants in the previous season's crop. Too much care cannot be exercised in this direction. If looking solely to earliness select with that end in view. If trying to raise fancy stock of any kind this would be the first thing one would do, and seed in vegetable life is just as important as it is in animal life, and the returns are much quicker. Third, growing the young plants. This is usually done in the ordinary hotbed, with stable manure for bottom heat, and the ordinary 3x6-foot hotbed sash for covering. Sow the seed in drills four inches apart, in not less than five inches of good garden soil, covering one-half inch deep, and firm the soil on top. I do this by rolling with a hand roller. As soon as plants begin to break ground give plenty of air, to insure a short, stalky growth. If the manure and soil used in the seed bed are fairly wet when the bed is made no more water will be needed till after transplanting. To insure good stalky plants the temperature should be from 50 degrees for night to not above 80 degrees during the day. A high temperature induces a tender, slender growth, and is to be avoided at all times if possible. At the end of five weeks from day of sowing the seed the plants should be ready to transplant to the cold frames, as they are usually called. These are of two classes, one for such as cabbage, lettuce, etc., and one for tomatoes, peppers and egg plants; it is the latter class that I wish to describe here. They are made by placing about two inches of barnyard manure in bottom of frame, put on at least five inches of good garden soil, that has previously been composted with a liberal amount of old fine manure (cow manure preferred); have this thoroughly mixed and made fine before putting on the bed. Be careful to get it on evenly if you wish uniform growth of plants; rake level, mark off in checks the desired width. I usually mark mine for early tomatoes and egg plants five inches each way, and pepper plants two and three inches each way. Fig. 32 shows a group of hotbeds situated on my place, made as I have described.

MR. HULSART'S HOT YARD IN NEW JERSEY. FIG. 32.

TRANSPLANTING.—No one can tell another person on paper how to transplant; this must be learned by seeing it done or studying it out. I usually transplant my tomatoes twice (but not my pepper and egg plants) and think it pays me to do so, but as there is a much larger army of growers that believe in only one transplanting, saving that extra labor and expense, I purpose to deal with only one in this article. We will call the seed bed the primary department, and the transplant bed the grammar and high-school departments, Now we have the plants promoted from the primary to that of the grammar and high-school departments and a great deal depends on the "principal" in these departments. If transplanting has been well done, the plants will show signs of new growth in about six days or a week. As soon as new growth is noticed, a liberal amount of fresh air is not only advisable, but absolutely necessary, and at the end of two weeks from time of transplanting the sashes should be removed entirely on all clear still mild days, recovering again towards night, according to the day and temperature. Keeping the sashes on continually makes a tender succulent plant, that will not stand transferring to the field, as early as one that has been treated as suggested above.

WATER.—This is another of the essentials in plant growing; a liberal application when needed is far better than numerous waterings that only wet an inch of the soil on top, inducing shallow rooting, which is wrong. This is why I have found moist bottom ground the best on which to place the frames; it insures a certain amount of capillary attraction, and lessens the labor of artificial wetting. Trim the leaves a little when the foliage becomes dense enough to shade the whole ground, as shade causes the plants to spindle. I am speaking now solely of tomato plants, as pepper and egg plants do not need trimming; on the contrary, it seems to do them a positive injury, and will do the same to tomato plants if done too severely. Remember always that when you cut the leaves from any plant you are taking away a part of its lungs. Six weeks is about the proper time for a plant to be in these departments of our school; then, like the child who has finished school, it is ready to be launched on to the world, and if proper conditions and training have followed it till now, nothing short of success should be expected. The future crop depends on the young plant's constitution.

To sum up: Sow good seed (in this latitude) last week in February in drills four inches apart, do not let seedlings stand thicker than three to the inch; air freely and do not let them get more than four inches high by April 1 (and half that height is sufficient if you are going to transplant twice), when it will be time to transplant to the cold frames. Shade lightly for a few days after transplanting if sun is bright, or until plants catch fast; air as much as weather will permit, taking sashes off as mentioned. Make waterings as near nature as possible. Trim to let in sunlight, but as sparingly as possible, all this done with judgment. By May 10 you will have plants that will do their best in the field if natural conditions are fairly good. Fig. 33 shows well-grown plants ready for setting.

C. C. HULSART.

Monmouth Co., N. J.

R. N.-Y.—On page 365 of last year's volume we told about Mr. Hulsart's "hot yard," a picture of which is shown on this page. The "yard" consists of a collection of long hotbeds. It is located in a rather low place, away from the winds, with a natural wind-break which shuts off heavy gales. Water is very necessary for the plant babies, and this is supplied from the barrel shown in the picture. At the time of our visit there were about 50,000 plants in the yard. The largest ones were being delivered in the shape shown at Fig. 33. In taking them out the soil was cut into squares with a sharp knife, and then the squares were lifted out on a fork as shown in the picture. When finally set in the ground these squares were cut again, so that each plant had its little block of soil. When this is set in a hill, and the earth packed up around it, the plant barely waits an hour in its growth. Of course this plan of handling pays only with the very earliest plants. Mr. Hulsart's system aims to induce earliness, and to promote rapid and vigorous growth, in which it is most successful.

STATISTICS OF AN APPLE ORCHARD.

In estimating probable yields from an orchard of apple trees there are many elements of uncertainty. Adaptability of variety to location, cultivation, including pruning and fertilization as well as care in securing and disposing of crop to best advantage, are ever causes of variable results. Besides, the last few years have been marked by far greater care in each of the above named particulars in the treatment of orchards everywhere; therefore better results may be expected than have been attained heretofore. We have trees now fruiting that were top-worked about 55 years ago. They stand along a fence bordering a field that was used for a succession of farm crops, including hay and pasturage. The last 15 years a vineyard has occupied the land. This has been regularly and carefully cultivated. On the other side of the fence the conditions are almost identical. These trees of Westfield Seek-no-further (now known in market as Seeks) have been regular croppers, and the quality of the fruit of uniform fair quality; yielding on the average from three to four barrels of marketable fruit a year. An orchard of mixed varieties, set about 45 years ago, 33 feet apart, was cultivated till it had been in bearing seven or eight years; then used as a hog pasture. It shows a great difference, owing to difference of varieties. Gravenstein, Greenings and Baldwins have made large growth, and have cropped well, usually every other year. Early Harvest, King and Dominie trees have not made such vigorous growth. King has generally matured only a light crop. The fruit of Early Harvest has been very imperfect, while Dominie is inclined to overcrop; fruit generally of fair quality. Some trees have been removed, and other varieties set in. The Gravenstein, Greening, Baldwin and Dominie trees have probably averaged three barrels each every bearing year.

An orchard of 150 trees, set 40 feet apart in 1891, of Fall and early Winter varieties, has been carefully pruned and ground well cultivated since it was set. In 1898 most of the trees bore some fruit. Last season there was probably an average yield of half a barrel on each tree, but the gale of September stripped the trees of some varieties. Wealthy and Boskoop held on fairly well, while Pound Sweet, Twenty Ounce and Gravenstein were nearly all blown off. Some crab apple trees set in 1894 had fine crops last year. They appear to come in bearing sooner than most varieties of apples. From my experience I judge that most kinds of apple trees, if well cared for, will begin to yield paying crops in from seven to 10 years, and that an orchard 20 years old well cared for should yield from seven to eight barrels a tree on bearing years. We have not yet been able to be sure of a crop every year. There is no doubt that orcharding has become so popular that in a few years it will be difficult to dispose of a full crop at remunerative prices. Then fewer varieties that are perfectly adapted to the location will be most profitable to the grower. W. D. BARNS.

Orange Co., N. Y.

LATE TO MATURE.—I cannot expect very much from a young apple tree until about 15 years old, and at 16 years of age I have had 80 Greening trees average three barrels to a tree, and one or two had seven barrels each at that age. All of my bearing trees are set 33 feet each way, making 40 trees per acre. I have 10 acres of trees 30 years old that average three barrels to a tree each year, 100 of them Greenings and 300 Baldwins; but these trees are too close, and I have set my young orchard 40 feet one way and 37½ feet the other, with the trees in the second row, half way between the trees in the first row, so the trees are really 40 feet from each other in any direction. The Greenings bear a little earlier than the Baldwin.

Ontario Co., N. Y. T. B. WILSON.

HOW VARIETIES DIFFER.—The type of an orchard is so modified by environment, that only approximate answers can be given. With good care and tillage Ben Davis trees should bear a moderate crop at six or seven years, Baldwin at eight, Spy at nine or 10. Within 20 years from planting Baldwin, and perhaps Spy, should give an aggregate yield exceeding Ben Davis, and averaging at 20 years a crop of five to 10 barrels per tree every alternate year. In general practice this yield is the maximum to be looked for, one orchard with another, where trees average 40 to 50 per acre. After 20 years the size and quantity of the fruit may be kept up only by careful fertilization, tillage and pruning on our average light soils. The above answers apply to standard varieties, selected exposure and soil, and expert care. No other conditions are likely to pay expenses commercially in the near future. The market more and more is calling for the best grown selections of old, standard varieties, and the superseded and newer unknown kinds are generally grown at a loss. With ordinary farmers' care the Spy comes into bearing at 15 to 20 years, and is seldom profitable. The Baldwin endures more abuse, yielding at 10 to 12 years, and Ben Davis rather earlier, though in our latitude the latter is unprofitable except with high culture. WM. H. HART.

Dutchess Co., N. Y.

CHESTNUT FARMING IN PENNSYLVANIA.

For the past few months an item about as follows has been going the rounds of the daily papers:

E. W. Warner, of Williamsport, Pa., is the owner of probably the oddest farm in Pennsylvania, says the Chicago Inter-Ocean. It is a chestnut farm, located in the mountain district of northeastern Lycoming County, near the Sullivan County line. The original saplings or sprouts were culled from a wide area of chestnut thicket, trimmed into shape, then grafted with the American sweet chestnut, a native nut of Pennsylvania. The result has been marvelous. This year was the third bearing season for the trees, and some of the nuts were astonishingly large, some of them measuring more than an inch across and growing as many as seven in a burr. The flavor of the nuts, it was feared, might be impaired by their size, but the kernels are as fine and sweet as the choicest Pennsylvania chestnut picked up in the fields. In order to preserve the trees from bearing prolifically, and thus endangering the growth of the tree, Mr. Warner went through his orchard when the burrs began to form and whipped off at least one-half of the fruit.

Several years ago we visited the hillside at Marietta, Pa., where H. M. Engle had grafted many natural sprouts to Paragon chestnut. They were then very promising, but within a year or two the weevils injured the nuts so as nearly to ruin the enterprise. We wrote Mr. Warner for the facts about his grove, and he replies that the report is quite correct. He has 2,000 trees, not of course in rows, but here and there as the stumps grew. Mr. Warner also says:

As regards the Chestnut weevil I anticipate no serious trouble from it, as the insects are confined to certain geographical zones or belts. According to my experience and travels of more than 20 years as a

TOMATO PLANTS ALL READY. Fig. 33.

geologist and mineral expert, throughout the mountains of the various States of the Union, I find that on certain slopes and at certain altitudes where the chestnut grows well and bears the finest nuts, the weevil is not known. Such weevil-proof belts exist in many places in the mountains of Pennsylvania, and to these commercial chestnut growers must go if they wish to succeed at the business. As regards native or extra large chestnuts, Nature has been planting and the forests growing them for hundreds of years. It remains for man to find these large and special nuts, and propagate them by grafting. A friend of mine some time ago told me of a wild seedling that he gathered nuts from, and which took but 40 chestnuts to fill a quart measure, which is about the size of the largest Paragon chestnut. As far as my experience goes as chestnut grower, I am quite well satisfied with the venture, and believe chestnut farming can be made to pay handsome returns, provided care and intelligence are used in grafting choice nuts in selected localities.

THE ART OF USING A BUCK SAW.

Standing behind a bucksaw and keeping it in motion is an art—sometimes an aching art, forsooth, as in the case of the laborer who said, "No, he didn't have the toothache nor the stomachache, but he did have the saw ache mighty bad." To do this, and yet work easily, requires an artful man. First let us look at the saw. Keep the teeth points sharp. Do not set the saw until it actually gripes in the log. The narrower the cut, with the saw running freely, the deeper goes each stroke—but keep the teeth points sharp. Touching up the teeth with a file every day is not too often. It pays. You rest yourself and saw wood fast while filing. As to the actual work of sawing, changing from one set of muscles to another is restful, i. e., throwing the work from the arm and chest muscles to the back and abdominal muscles. Remember it is your weight on the down stroke, steadily applied, that cuts. In a large log, start with the arm motion, and when the saw is well started, put on your weight and see the sawdust fly. Never fret because the fire stick does not drop. Keep the saw sinking into the wood and it will drop. How about big sticks that you can just drag to the buck? Why not split them with beetle and wedges in the woods? You can split as fast as with an axe, and each stick is handled at least four times before it is cut up. More sticks to handle? Yes, but try it.

Always have a support for the small end of the stick—an old box will do—and be sure it is as high as the buck. If there is no support, the small end of the stick trails on the ground. During the first two or three cuts the weight is not balanced on the buck and you must hold the stick to its place with your knee and weight. In this cramped position, the muscular power is lessened, and some of the weight that should be used in cutting off the stick end is used up in this auxiliary work. In a good-sized stick put both feet on the ground—left foot under the buck—and get motion by swinging the body back and forth with some pressure on the downward stroke. Don't guess entirely at the stick lengths. Have a measure of the stove fire-box, and on big sticks use it. It may save a whole cut. When you begin to ache sawing, quit and split. RICHMOND CONKLIN.

FARM LIFE IN A COLD COUNTRY.

We have had good sleighing here since November 25. The snow came with some rain, so it is solid, like Spring snow. We draw hay down from barrack in upper field, on the crust, with a team. I think it pays to build hay barracks in distant fields, so we can hustle the hay in in a hurry, when we are haying, and then we draw it in on sleighs in Winter with little expense. I cut my wood in the Fall, and pile it in log lengths in the woods, and draw it on sleighs: have it cut into stove lengths with a two-horse power. I pay $2.50 per day for power and team, and one man, and I furnish three men, two to get the wood to the saw and one to throw it back after it is cut. We all have to hustle, as we cut enough in two days to last me a year (about 50 cords). We use circular saw, and can cut a log 14 inches in diameter by turning it. Small wood two or three inches in diameter we cut four to eight poles at a time. We have seasoned wood to carry us through 1901, and the wood we cut this Winter we will burn next year. I usually have it split and piled in the shed before Spring work comes on. Two cords of seasoned wood (seasoned under cover) will go further and give better satisfaction than three cords of green wood. I think wood will lose 20 per cent in value if left out doors. First have good ventilation in shed, and then pile wood in as fast as it is split (if not wet by rain). Then you will have seasoned, dry wood that is of good weight.

I have 150 hens, and they are on strike this Winter; very few eggs. I have not had much time to attend to them, and perhaps there are too many walking delegates among them. It is wonderful how the cattle and sheep mow away the hay this Winter. We had to feed about a month earlier than usual. Think of it, sleighing since November 25, and no doubt it will continue well into April! I make calculations over my hay daily. If the upper barrack will last until February 1 perhaps the big barrack by the road will carry me through March. Then will the one in Riverside meadow and the other one on the hill carry me through April until May 10? I fear not; 28 cattle, 31 sheep and a pair of horses get away with a lot of fodder every day. The pigs in their warm cellar seem to be enjoying the Adirondack Winter. We put in a lot of buckwheat straw and let them burrow into it. They are doing well on skim-milk, apples and a very little ground feed. We killed six this year; put hams and shoulders in pickle, found ready sale for sausage, loins and bacon, and have packed the thickest pork in barrels, more than we can use, but I always find ready sale for it; never had an ounce of salted pork spoil. The last snow drifted somewhat. The weather has turned colder again, but with three good fires in the house and plenty of dry wood we manage to keep comfortable. The foxes bark around us at night and keep "Pup Sir" racing up and down to drive them away. We draw up to the fire and read THE R. N.-Y. and our New York daily, toast our shins, and perhaps snooze a little before it is time to go to count the cattle and sheep and feed the horses before we go to bed. S. C. A.

Warren Co., N. Y.

BEARDLESS BARLEY.—A new beardless kind called the Success has given good satisfaction at the Dominion Experimental Farm, Ottawa, yielding as high as 51¼ bushels to the acre. As far as I can learn there would be no risk in sowing it as extensively as any of the bearded varieties.

Canada. J. J.

CORN FOR HORSES.—Years ago corn and rye were grown—never oats except in rare cases. Hence, horses were fed on corn until long after the source of supply had shifted to South and West. Thirty years ago the horses on stage line from Provincetown to Orleans (25 miles or more), were fed a grain diet of corn exclusively. Of course, it may not be an ideal diet, but a horse of quality will show it on corn as surely as on any diet. A lunkhead can't be made to show spirit by any diet whatever.

Cape Cod, Mass. A. L. S.

WHERE SUBSOILING IS BENEFICIAL.

Its Use in Stony Fields.

In the main I agree with the writers who gave their views on subsoiling on page 5 of THE R. N.-Y., but there are lands that would be materially benefited by the use of a subsoil plow properly handled. I have owned such a plow, and found it practicable to use it upon nearly the whole of my land under cultivation. There is a great deal of land in New England that has been plowed over and over again to a certain depth, the depth being determined by the ability of the plow used to get down into the soil. On lands free from small stones, whether sandy or clayey, a good plow may be made to go down according to the power of the team attached, but if the subsoil is as hard as a common road, made so in part by the treading of the team for a hundred years, and this subsoil is also made much like a pavement by small stones that always throw the plow out of place every time it passes, no satisfactory seed bed can be made till this condition of things is changed. I have found nothing equal to a good subsoil plow for putting the land in shape for subsequent easy cultivation. The plow I used would run a foot deep without turning up any furrow or bringing any of the subsoil to the surface. It simply loosened the soil to the depth it was allowed to run, moving every small cobblestone so that any ordinary plow following it either immediately or ever afterward would hold its place, going under rather than being lifted out by the little paving stones.

When these subsoilers were first introduced it was expected that farmers would have a second team to follow the sod plow and stir up the subsoil at that time, or, using the same team, unhitch and change plows at each "round," but I found it a much better way for me to do the subsoiling in old ground that had been worked a year or more. I have subsoiled acre after acre in this way with a team of three horses abreast, with the reins over my shoulders, at about the same cost that would have been required for ordinary green-sward plowing. Were I preparing a field for nursery trees or an extra good garden I might cross-plow in the same way, thus tearing the soil more thoroughly, and loosening up the small stones even more completely. I usually followed the subsoil plow with a two-horse cultivator with strong teeth, and which would work the top soil as deep as necessary, hauling to the surface most of the small stones that the plow had loosened. All land that I have thus treated has been made much easier to plow in after years to the depth desired. I am not an advocate of very deep plowing for all land, but I want all cultivated land so that it can be plowed to an even depth with an ordinary plow, and I want the soil so free from cobblestones that the best tools for cultivation can be used without danger of breaking them. A subsoil plow should have a wheel in front under the beam to gauge the depth, and to aid the plowman in lifting out at the ends of the furrows. I used my plow a great deal in loosening up the soil when digging drains, thus saving manual labor with pick and bar. I expect very little sandy land would be improved by subsoiling, and I have no faith to believe that undrained clay would be permanently bettered by running a subsoil plow through it. But the soil of my farm was made easier to cultivate for all time, and without any injury to its quality or productiveness.

A. W. CHEEVER.

THE ESOPUS SPITZENBURG APPLE.

Thanksgiving Day is now weeks back in the old century, and further allusion to it will hardly be expected. But I trust it is not yet too late for a few comments upon the situation of the Hope Farm man alone in the old house on that night which he so aptly called "a trap for memories." It was a pleasant picture he drew for R. N.-Y. readers, as he looked out upon that damp moonlit valley, with the snapping wood fire blazing at his feet and "Grandmother's big nutcake within easy reach" there beneath those old wooden beams, in the shadow of four generations gone before. Strange noises he hears, and strange things come into his mind. Yes, who will doubt it? Spirit visitors wish him well, he says, but lament their inability to impart the real mystery and end of human life. So he thinks it all over for himself, and concludes that "human days are all too short for us to be properly thankful for the privilege of living and attempting to do our duty." I like his conclusion, and enjoy the whole picture. But lest I become too serious over the matter let me refer more particularly to what may have been my primary object in marking this article for immediate reference. He said he had "plenty of Baldwin apples near by." How sorry I was that he had nothing better in the way of an apple than the Baldwin! It was the only blemish in the the whole picture. How much I wanted to reach right down into my barrel (and the fruit is getting low down now) of Esopus Spitzenburgs, and hand over to him half a dozen of those glorious apples that grew right up here at the base of the Catskill Mountains. Yes, it was the very thing he lacked. I know that he knows just what a good apple means, because I've heard him talk about it in print. And this is the reason I want to extend to him my sincere sympathy even at this late date. Some people would be easily satisfied with the Baldwin apple, as they are with the Concord grape, the Duchess pear or the Egg plum, as the markets conclusively show; but not everybody. Is it right to be satisfied with inferior things when with the proper effort we can have the better? Contentment is indeed a most valuable attribute, and its lesson might well be studied more by the average mortal in this imperfect life, but to be content sitting down with folded hands is one thing, and being content standing up reaching out for something better is quite another.

If I remember rightly this Hope Farm man is a member of the Apple League. He likes apples, asks for them at hotels and restaurants, and eats them between meals, perhaps, as I do. Why I wouldn't give one of my Esopus Spitzenburg apples for half a dozen of the best oranges or any other fruit that can be named. And let me say here, I don't like this attempt to abbreviate the good old-fashioned name of this grand apple, calling it "Esopus," and either leaving off its characteristic title altogether, or italicising it as a mark of insignificance, as the American Pomological Society list now has it. My good friend Van Deman, of THE R. N.-Y., is doing this, and I wish he wouldn't. For the past year or more I have been trying to trace the precise origin of this princely apple. Mr. Brackett, the Government Pomologist, wrote me, telling how silent the record was on the subject and how anxiously he would await the information I was after. Well, I kept up the investigation until one day I received some rather careful data from a private source to the effect that the apple was of foreign origin. Of course it could not be proven, but the thing looked so dangerously authentic on its face that I abandoned further search then and there. But, of course, I don't propose to give up its domestic nativity, and I'll stick to Downing as my authority. It must have come to light here on the Hudson in this Esopus region. They can't produce such an apple outside of America. The trouble is if we don't plant it more than we have of late they'll begin to claim that we can't produce it any more here either, and that isn't true.

H. HENDRICKS.

WE want more information about silage cut with a shredder or "Blizzard." Does it pack closer in the silo? Does it heat less than when merely chopped?

DOUBLE-FLOWERED NASTURTIUM. FIG. 34. SEE RURALISMS, PAGE 88.

GRASS SEED AND NURSE CROPS.

Experience in Spring Sowing with Oats.

After reading what my friend George M. Clark has for years been saying about sowing grass seeds and corn, after reading what my other friend, A. W. Cheever, has to say on page 847 of last year's R. N.-Y., I am afraid I shall go right on sowing grass seed in the Spring with oats. I know my brother farmers will point the finger of scorn at me for acknowledging this, but perhaps if I tell them how I do it I shall not be ruled out for unprofessional conduct. Until well into the Winter my stable manure goes on to my meadows as top-dressing, and when I am disposed to plow a piece it is not exactly barren. When I plant corn and potatoes I use only commercial fertilizers, spreading broadcast for corn and dropping on the top of the hill or drill after the potatoes are covered. I am aware that this last seems like a queer wrinkle, but it won't hurt anyone to try two or three rows across a field, and watch them if blight strikes the field, and again at digging time. I intended to sow Crimson clover as a catch crop in my corn the past Summer, but I heard that it harbored the Pea louse, and as we had never had either I put it off. During the real Winter our manure is carted and piled, or rather dumped, 15 to 20 loads in a place, adjacent to the fields where we have had corn and potatoes, and when the ground is ready for sowing oats the manure is spread, about 10 loads per acre, and harrowed in with the oats. The grass seed is then put on, and a brush finished the work. Primitive, isn't it? But I think I can show more young clover to the acre than any of my neighbors, except one who followed my plan. We had an extremely dry Summer, and many have already plowed new seeded pieces, and sown rye, or will plow in the Spring. Curiously enough the best seeding of clover I have is on the driest part of the field. Had the oats not been the best I ever saw all over the field I should have thought the oats smothered the clover less, but under the circumstances I can only guess that on the dry knolls there was never much moisture, and the little plants sent their roots down so deep that when the oats were harvested the burning sun had less effect.

A part of the oats lodged and was cut early for hay, and as a little rain fell soon after a rank growth started up, and I wondered whether another year I would not cut all my oats early for hay. I shall watch that spot next Spring, but it grew a lot of corn grass that went to seed, and I am not sure that the stuff did not smother more clover than the oats. Besides that, I peeked over the fence at a field where a neighbor of mine cut the oats when green with a mowing machine. It looked so much nicer than my oat stubble that I was a little sorry for myself. He has since plowed that field and sown rye. He says that the machine cut so close that there was nothing to protect the young clover and grass, and the sun killed it all. We cut our oats when about half of the seed is ripe, or out of the milk, and being a lazy lot they are not thrashed. The bundles are cut twice so as to make three lengths of the straw, and fed to the horses.

We don't get five tons of hay per acre as my friend Clark does, but dry as the past season was, we had some lodge, and in wet seasons we are sometimes troubled quite a little that way. My farm is a light loam, with a gravel subsoil, giving thorough drainage. My father, when I was a boy, plowed in his stable manure with hoed crops, and always complained of having no rowen. When I suggested top-dressing he said it would be of no use, the land "was not natural grass land." It has been growing more and more into natural grass land for years now, and while Mr. Clark may be able to put on half a ton and take off five tons for a life time from an acre of ground, I am afraid it will turn out like irrigation.

I have built up almost all sorts of land, but deliver me from a piece that has been irrigated and grown, at first, big crops of grass, and then gradually run down until it is not worth mowing. Left to itself soil will not pump itself quite to death, but irrigation will assist it wonderfully. Mr. Clark's five tons must come from somewhere, and while I know him too well to doubt his faith in his plan, I lack faith in any plan that carries off by the cartload and puts back by the bagful. Man may cheat his fellow-man, possibly, and get rich at it, but sooner or later land will resent any attempt to cheat it, and the last state of the man who tries to do it is usually worse than the first.

Connecticut. R. S. HINMAN.

Farmers' Club.

[Every query must be accompanied by the name and address of the writer to insure attention. Before asking a question, please see whether it is not answered in our advertising columns. Ask only a few questions at one time. Put questions on a separate piece of paper.]

Tobacco and Lime for the Scale.

G. L. A., Vandalia, N. C.—Would a wash made of strong tobacco water and rock lime slaked in the water, so as to make a thick whitewash, kill San José scale?

ANS.—No, the mixture mentioned would be useless for Winter work. Whitewash will always kill a certain proportion of scale insects; but so small a percentage as to make it an unsatisfactory material to apply. Tobacco is very good as a Summer wash. J. B. S

Fighting the Asparagus Rust.

L. L., Factoryville, Pa.—I set last Spring 2,000 asparagus roots, and they came up and made a fine growth, but before frost the whole piece was as brown as a chestnut, and the tops dead. I suppose from what I have read in THE R. N.-Y. that it was the Asparagus rust. What would you advise me to do with it, plow it up and use the ground for something else, or can I fight the rust back and get a paying crop of grass?

ANS.—We would not advise you to surrender to the rust without a struggle. If your asparagus is one of the more resistant varieties, such as Palmetto or Argenteuil, the chance of success is better. Fertilize highly and cultivate well, so that much vigor may be stored in the roots before the rust again appears in August. Thorough spraying with Bordeaux Mixture both before and after the season rust may be expected to appear has been shown to be quite effectual, but is too expensive and troublesome a remedy for everyone to use.

Dandelions for Greens.

M. O. W., Scarsmont, Me.—What about raising dandelions for greens? What variety? Should they be covered in Winter? What is an average crop per acre, and what kind of soil will they do the best on? How much seed does it require per acre?

ANS.—Two varieties of dandelion are offered by leading seedsmen, the French Garden, which is about the same as the common wild root, and Improved Thick-leaved. The latter variety is new, and the seeds cost nearly twice as much as French Garden. The seeds are sown in early Spring in drills one-half-inch deep and 18 inches apart on thoroughly prepared and enriched land. If well cultivated and kept clear of weeds they will make strong roots that winter over without requiring protection. The leaves are ready to cut the ensuing Spring. They are often bleached by covering the rows with boards set on edge like an inverted V. We have no data concerning the average crop for an acre, nor the amount of seed required for the same area.

Air Tank for Bordeaux Mixture.

Reader (No Address).—A. I. Loop recently described his method of spraying by the use of air pressure. He speaks of air tanks. What are they made of, and will not Bordeaux Mixture corrode them?

ANS.—The "air tanks" referred to are common galvanized iron tanks. They are used for a variety of purposes, and are manufactured in large quantities in all the large cities. Any size from five to 400 gallons can be had, as different requirements call for many different sizes. Fifty-gallon tanks, costing about $15 each, seemed best for our use. We got them of the Bishop-Babcock Co., Cleveland, New York, Chicago. I don't think any serious trouble will result if simple copper solution is not used. A recent publication of the United States Department of Agriculture says that the corrosive action of Bordeaux is comparatively slight. We have not noticed any trouble from this cause. I believe I would rather use Bordeaux than common sulphate solution in almost any case. This device would do very rapid work in a vineyard, although we have never used it for the purpose. No serious trouble has ever been experienced in this grape belt. A. I. LOOP.

Home Mixture of Fertilizers; Charcoal.

G. F. W., Ashwillett, Conn.—How shall I mix a cheap homemade phosphate for potatoes or corn? Is charcoal dust good for a mixture put in with potash and other materials?

ANS.—You should send to Dr. E. H. Jenkins, New Haven, Conn., and obtain the fertilizer report of the Connecticut Station. A number of good home mixtures are given in this report. Here are a few of them—all made by good farmers:

Nitrate of soda.	Tankage.	Dried blood.	Acid phosphate.	Gr'nd bone.	Muriate of potash.
100	800	...	800	...	300
60	...	150	1,590	...	200
500	500	...	400	...	350
200	800	...	...	700	300
141	...	275	...	167	300

Other mixtures and substances are mentioned. It can be easily seen that a farmer must know what is needed by crops and soils before he can make a successful home mixture. We have not found it so easy to make a satisfactory mixture as some writers would have farmers believe. The charcoal dust has little real fertility, and will not take the place of wood ashes. It gives soils a darker color, and thus makes them better able to retain heat. Charcoal is one of the best absorbents. This dust put in the gutter back of the cows or mixed with the manure will pay well.

Soiling Crops vs. Old Pasture.

E. A. P., New Dorchester, Mass.—On my Pennsylvania farm I find poor prospect for pasture for next Summer. Is there any quick-growing grass or green fodder crop that I could plant early that would afford pasture or fodder for cows? In lieu of that, what would be the best chemical fertilizer to apply as a top-dressing to the pasture land, to help the growth of the grass?

ANS.—Oats alone or oats and peas sown at the usual time for this grain will give you good green feed. It will not pay to pasture them, for the stock will destroy more than they eat. You can cut the green crop and carry it to the stock. This is called soiling. The oats can be followed by fodder corn sown in drills. By sowing corn in this way every two weeks from the first corn planting up to July 4, you will have a good succession of green feed. We would not advise the use of fertilizers on ordinary pastures. We do not think it will pay. Nitrate of soda—250 pounds to the acre—will be most likely to start up the grass. Better put your fertilizer on fodder corn and cut that crop green.

Ten Good Agricultural Books.

P. J. S., Berwick, Nova Scotia.—Can you give me the names of 10 good popular books on agricultural subjects for reading by members of an agricultural society?

ANS.—A hard question. One should know what the readers have already studied, and what they most desire before advising. Of course such reading should include a good agricultural paper and the bulletins of the leading experiment stations. The following list will cover the ground, though it might well be changed to suit individual needs:

1. First Principles of Agriculture, E. B. Voorhees
2. The Soil.....F. H. King
3. The Fertility of the Land..I. P. Roberts
4. How Plants Grow.....S. W. Johnson
5. Principles of Fruit Growing.L. H. Bailey
6. Vegetable Gardening.....S. B. Green
7. Feeding Animals.....W. A. Henry
8. Milk and Its Products.....H. H. Wing
9. Economic Entomology.....J. B. Smith
10. Agriculture.....F. S. Storer

This is not by any means the cheapest list that could be named, and others might be better suited to certain individuals, but anyone who will carefully study these books may have a fair idea of the principles of scientific agriculture. If one lived in a section where chemical fertilizers are needed he should certainly study Fertilizers, by E. B. Voorhees. If stock feeding is to be made an object Forage Crops, by Prof. Shaw, and Soiling, by F. S. Peer, will be useful. The bulletins, and especially the annual reports of the experiment stations, should be not only read but studied carefully.

Clearing Land and Burning Brush.

I. R. F., Somers, Conn.—I have a large mountain pasture which is badly grown to brush, such as birch, huckleberry and fern. There are also some very good railroad tie trees which I do not wish to disturb at present, but it is of little use to cut the brush without burning. Will a fire damage the standing trees, and what is the law about burning pasturage where the adjoining land is a wood lot, and owned by others?

ANS.—One of the best ways to improve pastures that cannot be plowed is to cut and burn the brush each year. The amount of damage that will be done by burning the leaves and underbrush in a forest depends much upon the dryness of the material underneath, and the kind and size of the trees. I have known fires to run through forests of chestnut, where the trees were eight to 10 inches in diameter at the bases, and do very little damage. It is always better, however, to prevent fires from running over forest lands if possible. Neglect in burning brush, that leads to damage to adjoining property, will make the owner of the land, where the fire was set, responsible. If the one who owns the land where the fire is set, takes reasonable precautions, and yet the fire is carried to another man's land through the action of a whirlwind, probably no damage could be collected. C. S. PHELPS.

WHEN you write advertisers mention THE R. N.-Y. and you will get a quick reply and "a square deal." See our guarantee 8th page.

For the land's sake, use Bowker's Fertilizers. They enrich the earth.—*Adv.*

FREE DREER'S Garden Calendar for 1901
The largest and most complete SEED, PLANT and BULB Catalogue ever offered for FREE DISTRIBUTION. It contains 200 pages, which are fully illustrated, true to nature, and is bound in beautiful embossed lithographed covers. We will send a copy free to all who mention this paper, and request those who are Market Gardeners to state the same.
HENRY A. DREER, 714 Chestnut Street, Philadelphia.

EASY DRIVING FOR A HORSE.

Which is easier on a horse in a drive of 10 miles—a regular steady trot or a plan of driving fast for a while and then walking a short distance to rest?

USE HORSE SENSE.—Horse sense is probably not much unlike man sense. If you could ask the horse he would, no doubt, say, "Regulate my gait according to the lay of the road and the weight of my load." Try a 10-mile walk yourself. You would find yourself taking a slow gait up the grades, a steady gait on the level, and a faster gait down grade. Much depends, though, upon how and when the horse was fed before the drive. If he had just partaken of a full feed, I should give him a slow gait for the first few miles and a fast gait at the latter end, provided the lay of the road would permit. On the other hand, if the drive occurred just previous to feeding time the order would be reversed. So, then, if the good of the horse is to be considered, let the driver use a little "horse sense" somewhat after these suggestions. W. A. B.

Farmer, N. Y.

KEEP THEM GOING.—Ten miles is so short a distance that a horse which is unable to step off the distance with two persons in a buggy, in an hour, without distress or strain of any kind is unworthy of consideration as a roadster. My practice when making trips of 20 to 25 miles is to make about eight to 10 miles per hour, stepping them along smartly except when going down or up hill. I push them if in a hurry up grade at times, but never down, as I find that a horse will keep sound if given good care, even if pushed right along at a good smart gait, if allowed or made to go slow down hill or steep grade. Of course my horses are kept in hard-road condition and are naturally good road horses. A horse out of condition could be ruined in a 10-mile drive, and, if a driver is not a judge of condition, he had best let the horse take its own time unless a very ambitious one, when it should be held in check somewhat. My horses last me a good many years and stay sound, and some people call me a hard driver, but I don't think my horses consider their lot a hard one.

Vermont. C. A. CHAPMAN.

A DOCTOR'S HORSE.—Suppose we take a horse capable of traveling eight miles an hour; he would, I should say, accomplish a task set him, of say 16 miles, with greater ease by varying his gait, going more slowly on an up-grade or steep down-grade, and making up for the time thus sacrificed by putting on extra speed on the stretches of level road and moderately down grades. Some experienced horsemen go so far as to say that a horse will get over an equal distance with less suffering if the grade varies, than he would do if it were all on a dead level. This may be an exaggeration. It will, however, serve to illustrate the prevalence of the notion that the horse is helped by getting an occasional opportunity to move more slowly, or even to walk, although he may have to make up for the concession granted him by greater speed subsequently. But obviously there can be no fixed rule applicable in all cases, under all circumstances. Something will depend upon the kind of a horse, that is, on the way it has been trained, something on the weather, the road, direction of the wind, etc., something on the condition of his stomach, whether it be full or empty. If homeward bound and near the end of his journey it will probably do him no harm to keep right on without letting up. Some horses cannot be made to go fast and will yet keep up one steady jog. They take more after the tortoise than they do after the hare.

Canada. W. O. E.

LIKES AN OCCASIONAL WALK.—From my experience of six years as a commercial traveler, continually driving over all kinds of roads, in all kinds of weather, I would not trot a horse 10 miles without letting him walk several times in that distance, on any kind of roads. When driving I watch the horse closely and see if I am driving him as best adapted to his condition or manner of travel. If he is a heavy, clumsy-gaited animal I trot him short distances, and if he seems to swing his feet easily and steadily I see that he can trot longer than the heavy-gaited horse. I notice that there is a great difference in the way a horse is hitched. Let the harness fit neatly; have the tugs the proper length, and thills tight enough so he can handle the buggy easily—not too tight—but do not make the straps so loose that the rig will jerk and thills fly as high as his back. Fix the check-rein so as to hold his head easy for travel. I never use an overcheck rein. If the horse holds his head too low give him more oats, wheat bran or oil meal and the best of care when at barn, using comb and brush morning and night and his head will come up higher (and perhaps his heels, too). When starting on a long drive I give the horse plenty of time at the start or after each meal, then I know he is good all day. If a man thinks a horse can trot 10 miles without walking several times let that man start out and run one mile without a walk and then give his own opinion.

Pa. J. G. K.

Small Fruits in a Windy Country.

One of our readers now located in North Dakota sends us the following question: "What are the chances of successful small fruit growing in southeastern South Dakota, near Sioux Falls?" It seems to us like a hazardous undertaking to embark in fruit culture so far to the north and west; yet, there may be good openings there which we do not understand.

ANS.—I consider the chances favorable. By going into the business in the right way, most if not all of the small fruits can be successfully and profitably grown for market purposes in southeastern South Dakota. There are many sheltered nooks with some natural timber protection and groves, and shelter belts on the older farms that would afford good sheltered locations for the business to be found in near proximity to towns and railroads that I think very well adapted to the purpose. The greatest obstacles in the way are the dry winds that frequently sweep over the country, and the first requisite is to provide for protection against them by planting shelter belts or wind-breaks of trees or shrubs on the outer sides from which the winds come (generally the west and southwest). These are very quickly formed by planting the White or Gray willow. Evergreen belts would be better, but are not so quickly available and require shelter at the start. Even closely-planted rows of native plum trees (Prunus Americana), or the fast-growing varieties of the Siberian crab hybrids will answer the purpose well, and soon bring enough returns in fruit to cover the cost of care and cultivation. In large plantations in very exposed locations it would be beneficial to plant a single row of fruit trees rather closely (eight or 10 feet apart) about every 12 to 20 rods, according to situation. Soil should be chosen that is naturally fertile, of good depth, and that is not underlaid with loose gravel near the surface, and it should be well subdued by plowing and cultivating before the small fruits are planted. Where strawberries are to be grown they should be planted sufficiently far enough away from the outside belt on the windward side, so that they will not receive the banks of snow that otherwise would be piled upon them in times of severe storms. It is best to plant the rows six or more feet apart. That distance gives more room between matted rows for cultivation (hill culture does not succeed there); also to pile in windrows of straw or prairie hay for Winter protection, but only about two inches of covering should be placed over the plants. The windrow of straw or hay may be placed quite early in the Fall if there is ample moisture in the soil, but the plants should not be covered until Winter is about to set in. These windrows should be left until the picking season is ended, when they would better be removed and used for mulching trees or raspberry and blackberry patches, and the cultivation of the strawberries resumed. Without the wind-breaks it would be necessary to weight these windrows down with poles. They are a good protection, hold the light snows over the plants, and prevent excessive evaporation. Where this system of planting and arrangement is followed I think that if any pistillate varieties are grown it would be better to mix perfect varieties in the rows with them at the time of planting. Red raspberries will succeed very well if given Winter protection by bending the canes down and covering with earth and straw or other mulching over the top. The Turner and Loudon are hardier than the Cuthbert. It is more difficult to manage the blackcaps after the first Winter, and they need to be kept low by pinching back to cause bunching near the base of the canes. Rows of these may be planted outside of the strawberries and nearer to the wind-breaks, as they are less liable to be smothered by snowdrifts. Blackberries must have ample Winter protection by being laid down and covered with earth over Winter. All bush and bramble fruits would require liberal mulching through the fruiting season. I believe that an energetic young man who understands the business can find plenty of locations in that section where the business will bring better returns from the same amount of capital invested than he could in many localities that are considered more favorable for small-fruit culture. If in addition to suitable soil and shelter, water for irrigation in times of great drought can conveniently be had, success is almost assured. J. S. HARRIS.

BUY ARTICHOKES NOW while they are cheap. 50 barrels white variety Jerusalem Artichokes, only $2 per barrel. The cheapest and best hog-feed on record. I raised 600 bushels on one acre of only fair land. Money must accompany order. Address P. H. HEYDENREICH, Staunton, Va.

A Glittering Gold Field the Second Year. **PALMER'S VERY EARLY STRAWBERRY** It is with intense satisfaction that we can at last introduce a new Early Strawberry, which bids fair to add millions to the wealth of the States and Nation, and which will be hailed with delight by Fruit Growers, Dealers, and Consumers, throughout the world. In offering this remarkable Early Large Strawberry, we guarantee the Palmer to yield twice as much fruit as any other Early Berry, and ripen from 5 to 10 days earlier than any other Berry in cultivation. To all purchasers we will refund the sum paid for the Palmer Early, if it does not do as we claim the second year, so you have nothing to lose and all to gain. List Free. T. C. KEVITT, Athenia, New Jersey.

"STRAWBERRY PLANTS THAT GROW." LUTHER—Most promising Extra Early, $3.50 per M. ROUGH RIDER—Best late, $2.25 per 100. Fifty other Strawberries. Also, Raspberry and Blackberry, Currant and Grape Plants. CATALOGUE with CULTURAL INSTRUCTIONS FREE. C. E. WHITTEN, Bridgman, Mich.

The Rough Rider Strawberry is going to be more largely planted than any other strawberry in the next few years. We are headquarters for plants. Seven acres of planting, more than five times as many as all others combined. Price reduced to 75 cents per dozen; $3 per 100; $25 per 1,000 for early orders. Catalogue free. L. J. FARMER, Box 20, Pulaski, N. Y.

ROUGH RIDER, SEN. DUNLAP, and other **STRAWBERRIES** 100 Varieties. CUMBERLAND RASPBERRY, KING OF MICHIGAN POTATO. HEADQUARTERS FOR HIGH GRADE **Plants and Seed Potatoes.** Descriptive Catalogue Free to All. FLANSBURGH & PEIRSON, Leslie, Mich.

FACTS ABOUT PORTO RICO.

CLIMATE.—Prof. George B. Groff, Lewisburg, Pa., who spent two years in Porto Rico as Commissioner of Education, gave a most interesting address on the fruits and vegetables of that tropical island at the late meeting of the Pennsylvania State Horticultural Association at Harrisburg, Pa. The interior is mountainous, with an average elevation of nearly 2,000 feet. There is practically no swamp land, and the slopes are nearly all covered with rich black soil. The north coast is well watered, but the southern half of the island is subject to occasional droughts. There are over 1,300 named streams, but the course of most is very short. He described the climate as nine months June and three months August, though the temperature range is only from 75 to 96 degrees, excessive heat, such as frequently experienced in the North, being unknown. Constant sea breezes temper the whole Island, as the most distant point is scarcely 40 miles from the ocean. Nearly all the vegetables cultivated in the North are grown, some in very limited quantities, however.

VEGETABLES.—Asparagus was seen at one place, but the plants were small and the growth far from thrifty. It is not found in the markets except as imported in cans. Beans are extensively grown and form a staple food. Red beans of the kidney type are much preferred, as they cook easily and are considered more digestible; white beans are not liked. Some Lima beans are grown, but as they are not picked until nearly ripe the table quality is not good. One of the local varieties of beans grows on a small tree. A few beets are grown, but are not generally used. Carrots were not seen. Cabbages are highly prized. They do not head hard as in the North. Celery is grown in a small way for soup. Water cress is abundantly naturalized in the streams. Sweet corn is much grown, but is picked too old for best quality. Cucumbers are plentiful and good. Sugar cane is used extensively as food and is nutritious. The Caladium, more properly Colocasia esculentum, is used for food, but as commonly cooked is not very palatable. Ginger is now well naturalized and grows wild everywhere, but is not much used. Egg plants thrive well and are much cultivated. The natives bake, but seldom fry them. Lettuce is plentiful, but of low quality, as it is not carefully cultivated. Watermelons are scarce, small, and not very good. Onions and garlic much used for flavoring; they are not grown, but abundantly imported. Okra is much esteemed, and is eaten cooked as a vegetable and rarely used in soup. Parsley is occasionally grown as a soup flavoring. Peas thrive well, but are not picked until too hard. Peppers grow luxuriantly and are eaten green; not used as a condiment as in other Spanish countries. Sweet potatoes grow well, but are not as good as the Jersey product. Small varieties of pumpkins grow everywhere, and are much eaten, being used in soup as well as cooked like other vegetables. They are small and ill-looking, but of fair quality. Radishes of the small red type are plentiful but low in quality. Rice is the staple food of the natives, and is generally cooked like a vegetable and colored with annotto, which is also used to color milk and soup; never used to color butter, as with us. Rhubarb and squashes are not grown. Tomatoes ripen every day in the year. Native varieties are small and ill-flavored, but very productive. Good ones are being grown by Americans. Turnips grow well but are seldom planted. Many large woody yams and some Cassava plants are grown. They are poor eating. Northern seeds do not germinate nor grow well as a rule.

FRUITS.—The mountains are full of Citrus fruits, but they get no care, and are generally of poor quality, but some are good. Oranges can often be bought for six to eight cents a hundred. Lemons are plentiful but little used. One variety is very sweet. Dates and figs are not often seen. Bananas are very plentiful, and are found in many varieties. Together with rice they form the staple but insufficient food of many natives. Cocoanuts are plentiful near the coast, and the green nuts are always in demand, the liquid interior being used as a beverage. Chocolate has been largely cultivated, but is dying out. Coffee growing is still the main industry. One kind of breadfruit contains seeds that resemble large chestnuts and taste like them when boiled or roasted. Pineapples are numerous and of most excellent quality; better than those raised in Cuba and Florida. Many tropical fruits of minor and local importance were described. No northern fruits are grown. A few neglected grape vines were seen. Peach trees grow, but bear no fruit. No berries were seen but the Mayberry (Rubus eratægifolius?) introduced five or six years ago, is becoming naturalized, and is spreading rapidly. The berries are sometimes seen in market, and are much liked. W. V. F.

A Word About Cow Peas.

A. T. G., Dayton, N. Y.—Where can I get cow peas, and are they good to keep up flow of milk after grass has dried up in the Fall?

ANS.—Cow peas are offered by dealers and farmers in THE R. N.-Y. If you sow them expecting late Fall pasture you will be disappointed. They die at the first hard frost. We do not advise cow peas as pasture, though some farmers use them for hogs and cattle. We advise them for plowing under on poor land. Do not sow them too early. They are as tender as beans, and June 1 is early enough for your latitude.

EVERY FRUIT GROWER SHOULD READ R. M. KELLOGG'S NEW BOOK, ENTITLED
GREAT CROPS OF SMALL FRUIT
AND HOW TO GROW THEM. The author has grown the largest crops of fancy fruit ever produced on an acre. In his experimental grounds are **single plants which yield over FOUR QUARTS** each of fine large berries. His customers have done as well. This has been accomplished by SCIENTIFICALLY BREEDING **up plants** to a high fruiting vigor so they throw their energies to the development of fruit instead of useless runners. **The profit comes from a big crop of big berries** that sells at sight to regular customers. This book tells you all about how it is done. THE CHEAPEST PLANT is the one that will give you the best fruit and most of it. You can't afford to play **second fiddle** on the market by using scrub plants. The only stock of scientifically-grown thoroughbred plants in the country for Spring planting. Send your address at **once**, and get a copy of this book, and a revised edition for three years FREE. Address
R. M. KELLOGG, Three Rivers, Mich.

For Wholesale Spraying
in large commercial orchards where the saving of time, labor and material is a necessity, to say nothing of having the spraying done in the right "nick of time" nothing equals
This Orchard Monarch
—note the large **storage chamber** in front. A convenient pump operated by chain sprocket from rear wheel raises air pressure to 150 lbs. With 12 gallons of liquid in chamber this will work two Vermoral Nozzles 5 to 10 minutes at full capacity—enough to spray the largest tree. Automatic agitators keep liquid thoroughly stirred up. Brushes clean suction strainers automatically every instant. No burning or scalding of foliage. Sold complete as shown in cut. We make the
Famous Empire King Barrel Sprayer
and full line of smaller machines.
Send for free catalog and opinions of people who used it last year.

(PATENTED)

HOPE FARM NOTES.

FARM VALUES.—A friend in New York State has this to say:

I have been interested in Hope Farm Notes, especially the rocky fields, as I have worked at clearing off rocks by spells all my life, but not for fun. Whether it has paid in the end I don't know. Thirty-three years ago I commenced on the farm where I now live; have it pretty well cleared up, have built a house and barn that cost $3,500, and if forced to sell now it wouldn't bring what I paid for it, as land has fallen off nearly one-half in value here. It has always supported the family, which at times has been quite large, and paid running expenses, but whether it has paid my wife and self for all the hard work we have done, I don't know. But we have the home, and perhaps if we had done something else we might not have had anything, as we commenced life together with what I had saved in two years working by the month.

In many localities the value of farm property has come tumbling down. I bought Hope Farm at about the lowest limit, and it is actually assessed to-day for $1,000 more than I paid for it. Some farmers say that farm property does not pay interest. Years ago, when their farm was valued at $5,000, it gave them a living. Now when the value has fallen to $3,000 it still gives a living! The farm next me has recently been sold by the sheriff. It has supported the old farmer for nearly 50 years. Had he been able, 20 years ago, to look ahead and anticipate the present value of red Winter apples do you imagine that his farm would have reached the sheriff? No! No! I am obliged to admit that even the Ben Davis apple would have saved the farm. He farmed simply from year to year with no crop provision for the future. It is pretty hard for an old farmer to make out whether the farm has really paid wages to himself and his wife. I know this, that a home on a farm that is paid for and well improved is safer than one backed up by bank stock or town reputation. It is not so easy to turn into cash, but it is safer.

HAM CURING.—Some people may love a live hog, but most of us feel real affection for a dead one—after he has been cured of his bad qualities and turned into ham. Among the various cures mentioned by readers is the following:

I notice in Hope Farm Notes an allusion to curing hams. It reminded me of the method which a relative of mine has followed for many years, used before his time by preceding members of the family. That they follow it so long indicates that the results are satisfactory, and I know from many personal trials of the cured hams that they are unusually juicy and sweet. The treatment is this: Put in a large iron kettle a bushel or two of salt, heated until it is as hot as it can be made, just sizzling hot. The fresh hams, just cut from the pig, are put in this hot, dry salt, turned over and drawn around in it till the entire outside has been in contact with the salt for a few minutes. Then they are smoked and are ready for the table. They keep well and are fine-flavored. W.

That is worth trying certainly. This cold weather enables us to feast on spare rib and sausage and but little of our pork has been salted or smoked yet. Surely no one would think of following a practice of this sort for years unless it was a good one—yet sometimes habits are rooted into us so that it is almost impossible to pull them out.

"LIVING RIGHT."—The recent note from B. Briggs on the proper way to spend Sunday has stirred up more discussion than anything we have printed in a long time. People who believe as Mr. Briggs does, others who half-believe, some who say they don't believe in anything at all, and others who don't know what they do believe have been filling the Hope Farm man full of advice and suggestion. I feel as though the dogmatic discussion of 20 centuries had been boiled down and rubbed into my back. They come so thick and fast that the remaining years of what I may hope for as a natural life will be all too short to reconcile these various beliefs. I will give up the job until I get my farm paid for at least. To me it is a source of deep regret that good, right-minded people cannot come together on some fair basis of religious agreement. Of all men the farmer should have some deep and true religion in his heart. He is close to nature, and every day's experience must convince him that he, and what he calls his own, must bow to the will of some superior and mysterious power. To me it seems no more than reasonable that if the natural forces which decide our physical destiny are fixed and exact, the moral forces which have so much to do with personal good or evil must also have some fixed measure or law. But you can hardly expect a plain farmer to strike bottom when able and devout scholars have failed. I believe that the good Lord gives us the chance to work our salvation out of our own lives by *right living*. Some good people narrow it down and, as it seems to me, cramp themselves into various *forms* of worship. Others go to the other extreme and ignore all such forms, and have no patience with them. I wish the world would quit discussing forms and creeds, and get together on the foundation principles of Christianity.

STOCK MIXTURES.—A Jersey friend wants to know about the "lick ball" which our horses have:

Some while ago I noted in Hope Farm Notes mention made of salt balls for horses, in proportion of two parts salt, one part lime and one part wood ashes or charcoal. What kind of salt and lime is used, and how much water?

Charlie makes the ball as follows: Take two cupfuls of salt—either table or barrel—one-half cupful of air-slaked lime and four to five cupfuls of wood ashes. Mix them well and add enough water to make a stiff mud. Then bake in an oven until it is dry and hard. It can be made in a cigar box which gives it good shape and size. The barn tongue that licks this mixture will never tell a lie about it, but come for more. For sores on horses we like a mixture of one part carbolic acid and three parts of sweet oil. A mixture of equal parts ammonia and sweet oil made a good blistering liniment for old Franko's leg. To reduce the swelling we now expect to use biniodide of mercury, one dram, and cerate of cantharides ointment, one ounce, well mixed.

FARM NOTES.—The shredded fodder is keeping well, and the horses clean it up. I feel sure that the shredding added at least $3 per ton to the value of the stalks. I hear some complaints that this fodder does not keep well. We have had no trouble with it. . . . In answer to several questions I will say that our waste molasses came from the Binghamton beet sugar factory. We feed it to all stock except the brood mare. I call it a useful feed. Old Major startled me the other day by trotting up hill of his own accord—something he has not done in months. He was going away from home, too. Strange that cold molasses should warm up an old horse! . . . The chief work on the farm now is in clearing up two of those old "loafer" fields I have told about. The boys are cutting out the cedars and birches, and clearing the walls. The cow peas are left on the ground, of course. I hope to fill these fields with peach trees this Spring. They are well located for peaches, and the soil is too light for seeding down. Yes, I am going to give the Stringfellow method of planting a good trial on quite a large scale. J. H. Hale tells me that I shall only encourage a lot of lazy men to quit needful cultivation, and never get a first-class crop. Other good men tell me the same thing, viz., that this plan is O. K. for the South under certain conditions, but no good for our section. I suppose I should heed these wise men, but I am frank to say that Brother Stringfellow has so much faith in his scheme that some of it has run over into me, and I shall try one acre that way at least. . . . We still have a good supply of small potatoes, turnips and cabbage for the stock. How they do enjoy a "green" bite. What with shredded fodder, molasses and roots I never fed horses so cheaply before. H. W. C.

A FARM BENEATH THE SNOW.—I thought you would like to hear from the Adirondack Mountains, as we are situated in the very heart of them. Snow came November 9; there has been sleighing since, except about five days. The snow in the woods is three to five feet deep, so you see we do not have to sow cow peas for a cover crop. I will tell you what I sold off my 40-acre farm in the past year:

Milk sold, average 8¼ cows:

24,648 qts.		$1,339.17
Vegetables and truck		285.25
Net proceeds of hens		50.00
" " " pigs		20.00
" " " veal		3.00
Total		$1,697.42
Expense running farm	$200.00	
Feed and hay bought	190.00	
Implements	102.88	
Milk wagon	45.00	
Bowen fence machine, etc.	13.00	
Cutter harness	40.00	
Total	$590.88	$1,697.42
		590.88
Total		$1,106.54

I have made no account of boarding help or of any vegetables we use in the house, which is a good many, as we have a family of from six to nine most of the time. I think that is doing quite well. I have not figured in a new boy six months old, $1,000 at the least.

Tupper Lake, N. Y. READER.

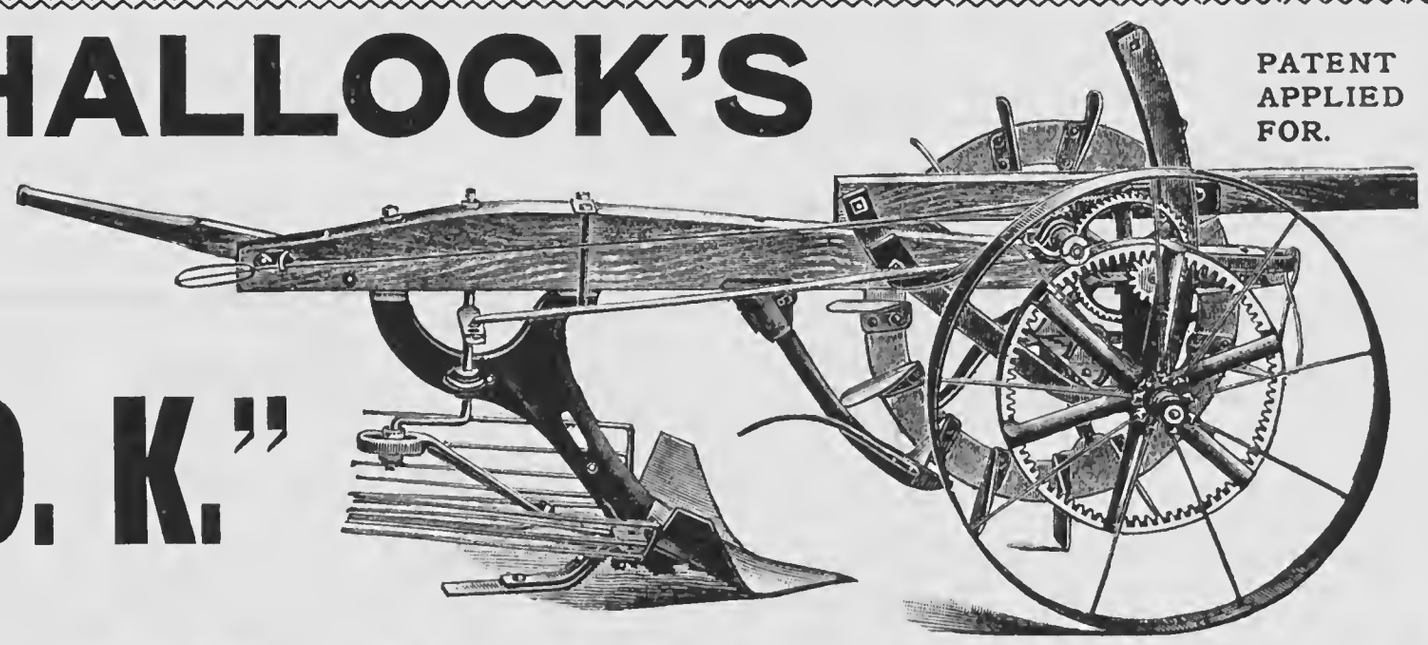
R. N.-Y.—That is a good showing for the farm, but a very low estimate on that new boy.

SHADE TREES.—The Connecticut Station (New Haven), has issued an excellent bulletin in No. 131. The city of New Haven is noted for the beautiful old elm trees, which shade its streets. Many of these veterans are dying. The causes are old age, lack of air and water, or of plant food, mutilations, poisoning, insect enemies and electric currents. The Connecticut Station made a thorough investigation of these troubles and has gathered in this bulletin information of great value to those who love shade trees.

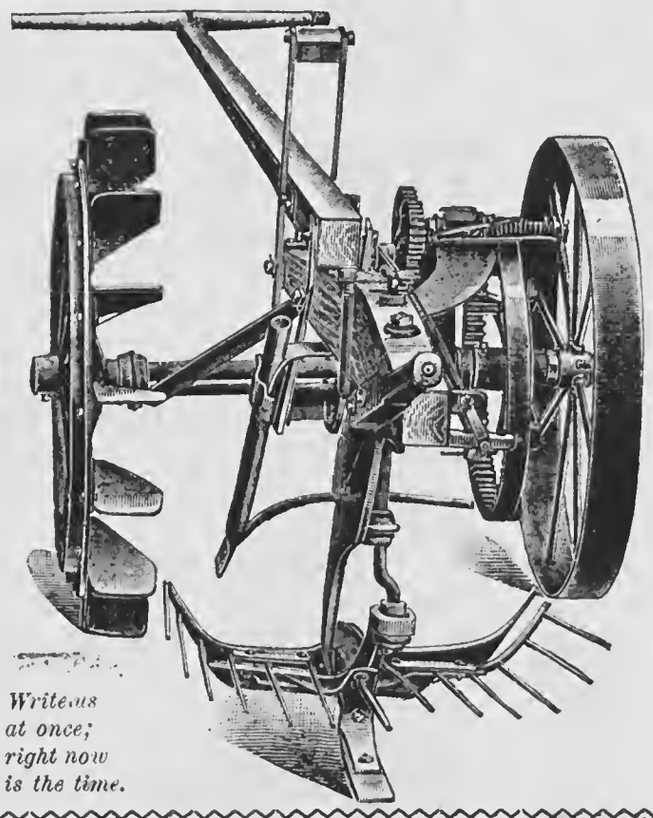
HALLOCK'S

PATENT APPLIED FOR.

"O. K."



POTATO HARVESTER.



Write us at once; right now is the time.

POTATO GROWERS, this is the digger you have so long looked for, hoped for, longed for. The price is right, the draft is right (one team), easy to handle, strong and simple, every potato taken from its bed by the shovel, and every potato separated from the soil by the wonderful fork; dig every row straight as you go. In a word, it is hand work done with two horses.

OUR GUARANTEE. We guarantee the **O. K. Digger** to equal hand work. In other words, you dig a certain number of rows by hand, then dig an equal number with the **O. K. Digger,** pick up all potatoes in sight, then harrow, cultivate and plow, either or all; if **"O. K."** does not come out ahead, you are at liberty to reject it. We know just what it will do because we have followed it in a dozen fields in different parts of the country.

WHAT WE WANT. Correspondence with 60,000 potato growers before the winter is over, so we can tell them all about the digger and the **wonderful offer we make for quick orders and introduction.**

We know we have the digger you want. We know every potato grower who does not buy one will want his potatoes dug with one. This would mean profitable work for you if you had time for it, or could spare the digger.

D. Y. HALLOCK & SONS, Box D 805, York, Pa.

Please mention box number.

Ruralisms

NOTES FROM THE RURAL GROUNDS.

DOUBLE NASTURTIUMS.—Some time previous to 1890 a double flowering form of the climbing nasturtium, Tropæolum majus, was sent out by an English nursery, and introduced into this country by Peter Henderson & Co. It is a profuse-blooming variety of good constitution, sending out rather thick, short-jointed twining stems with bright green foliage, large clear yellow blooms, with a few orange streaks in the center. It thrives particularly well as a pot or window plant, and is very bright and cheerful. The flowers last much longer when cut than the single varieties. It does not form seeds, but is easily propagated by cuttings or "slips" in the usual manner. Since the yellow variety appeared two others, one with dark, glossy, maroon, double flowers, often catalogued under the name of Darkness, and a bright orange form called Herman Grashof, have been disseminated from Europe, and are occasionally seen in amateur greenhouses. Herman Grashof is somewhat delicate, and has about dropped out of cultivation, but Darkness is still listed whenever the propagators get up a good stock. No account has been given of the origin of these pretty and useful nasturtiums, but it is supposed that they are bud sports from ordinary varieties of the same colors. At pretty regular intervals since their introduction the yellow and dark varieties have been offered to the Henderson Company and other well-known plantsmen as startling novelties, by amateurs and growers who have worked up a small stock from a chance plant, and who are ignorant of its introduction to American horticulture. Fig. 34 shows a flower and foliage of the yellow form, which is on the whole the most desirable of the three varieties. It is a poor and badly arranged picture, and further reduced in effectiveness by the wilting of the flower before the negative was taken, but it gives some idea of the make-up of leaf and bloom. We think these double nasturtiums cheerful and desirable plants, both for garden and home decoration, and commend them to amateurs desiring pretty and easily-grown plants. They seem to have fallen out of the latest plant catalogues, but the yellow variety may still be had from the American introducers.

GREENHOUSE TOMATOES.—Our first Winter tomatoes were ready for the table January 12, as against January 3 of last year, and were beautifully colored. The plants are setting heavy clusters, and promise a larger crop than we have yet secured from a similar number, though maturity has doubtless been delayed by overfeeding at a too early stage. When well set with growing fruits they will bear constant stimulation with weak liquid manures from various animal sources, as well as dressings of wood or tobacco ashes and commercial phosphates or bone dust, every three or four weeks. Water must be freely given on bright days, as the immense leaves developed under these conditions are very active in exhaling moisture, and if the plant once flags some of the younger fruits are sure to be lost. We find pollination is practically certain if the petals of the open bloom are tapped once or twice every day with a light reed. There is a time in the development of every bloom when the pollen will fly out in a visible white puff if the petals are lightly switched, and this method seems more effective in favoring the perfect developments of the tomatoes, by fertilizing a large number of seed ovules, than the usual plan of striking the supporting strings, and thus indirectly jarring the blooms. Some growers find it profitable to catch the pollen from maturing blooms in a watch glass mounted in a wooden handle, and apply it to the stigmas of the younger flowers, claiming that larger fruits result from this excess of pollen. Where houses are specially arranged for tomato growing, it is practicable to get around among the plants and thus pollinate the individual blooms, but if only a few plants are grown they are likely to be kept in a position difficult of access, and the method of jarring the blooms with a light reed, as they successively open, is proving to be very effectual.

CHICKENS AND COW PEAS.—Our little field of cow peas bore a fine crop of ripe seeds, which were picked just before frost was expected. As sufficient frost to kill the vines did not appear until several weeks later, a considerable number of pods, immature at the time of picking, ripened up in good shape, and are still clinging to the vines. Within the last few weeks our chickens have discovered that these little black beans make palatable food, and spend their exercise hours in scratching open the tough pods. The result is apparent in the laying record; the combined effect of the protein in the beans and the necessary exercise in the open air has plainly been the means of transforming the fat in the hitherto rather sluggish older hens into eggs, just when they are most wanted. If we could be sure of always having such an open Winter it would certainly pay to grow a patch of cow peas in a convenient situation for the chickens to harvest at their leisure in Winter, but much rain or snow would make the pods too difficult to open, and probably injure the feeding value of the seeds. The beans, which are still quite dry within the pods, resemble dried apples in their capacity for swelling up after the fowls have eaten them, and the result is an urgent demand for water while the process is going on. Our flock of 25 consumed nearly two quarts of water after one of these dry feeds. This matter of abundance of pure, fresh water is as important in Winter as Summer, especially as much of the food eaten is dry and absorbent in character. The considerate poultry keeper will see that water, and not ice, is within the reach of his fowls even in the coldest weather. The cow peas are of the Early Black variety, from seeds secured from Hope Farm. Most of our readers know that the cow pea is really a species of tropical bean. The name is now too well fixed to change. W. V. F.

Native Plums in Wisconsin.

PART I.

The plum orchards at the Wisconsin Experiment Station now contain about 1,400 native plum trees. In addition to these there are nearly 1,000 trees from one to three years old in the nursery, many of which will be planted in permanent orchard rows next Spring. Of the total about 250 are named varieties, and the remainder seedlings; of the named varieties 200 bore last year. The best of the new varieties, those that bore for the first time last year, are Brittlewood, Bomberger, Etta, Freeman, Poole's Pride and Number 4. Brittlewood is a very large plum of excellent quality of the Americana species; skin only moderately thick; flesh tender and juicy; stone small and nearly free. From Theo. Williams, Nebraska. Bomberger is large, oblong, slightly tinged with purple on yellow ground; skin thin, tender and not at all harsh; flesh tender, sweet and rich; above the average in size and quality. Etta, large, nearly round, yellow striped and splashed with pale red; flesh, sweet and rich. A single small graft of one year's growth is the only specimen in the orchard, and it is hardly fair to form conclusions from this, but the fruit borne was very fine, attractive in appearance and high in quality. Freeman, very bright shining red; no bloom; skin thin and tender; flesh crisp, juicy and having a delightful aromatic flavor entirely unlike any other plum tested. This may not prove a valuable market sort, but is very striking in appearance and has a very remarkable flavor. Poole's Pride, a very good plum of the Hortulana type; better than Wild Goose or Pottawattamie; medium to large; skin thin and tender; flesh firm, sweet and rich. The last one of the list we are obliged to record simply as No. 4, as it was received from Prof. Budd with no other title. This is a cross between De Soto and an unknown Japan variety; large to very large, oblong, slightly pointed; resembles Abundance in shape and markings; skin thick but tender; flesh orange-colored, crisp, tender, juicy and rich with a decided Japan flavor; freestone; tree a poor grower, weak and drooping. Many other varieties fruiting for the first time, were also good, but these are the ones attracting most attention.

Among the older varieties, those that have borne two years or more, we note the following as especially good plums: Aitkin, De Soto, Hammer, Piper, Quaker, Springer, Surprise and Wyant. The Aitkin is only medium in quality, and a poor keeper, but is valuable as an early variety. Hammer is very productive and an annual bearer. Springer is one of the best mid-season plums in our collection. The Surprise is worthy of all the praise that it has received in regard to quality, but has proved a shy bearer here, with decidedly "off" seasons. Wyant must still be placed at the head of the list as the best native plum in our collection, hardiness, productiveness and quality all considered.

Other prominent varieties are American Eagle, Barnsback, Cheney, and North Star. American Eagle and Hawkeye are both very large, but poor in quality and decidedly unattractive when fully ripe, assuming a dull purplish color. Cheney is decidedly irregular in bearing, giving a full crop only about every third year, and then overbears. Barnsback is above the average in quality, and a perfect freestone. North Star closely resembles Surprise in all respects; in fact, about the only point of difference is in the shape of the pit. Like the Surprise, it is a shy and irregular bearer. The varieties that might well be dropped as too small and inferior to be of much value are: City Deep Creek, Honey Homestead, Old Gold, Peach and Speer.

Live Stock and Dairy

THE BREEDERS' WAYSIDE.

Feed for Brood Sow in Winter.

Will Prof. Plumb give a good, and as cheap a ration as possible, for a brood sow during Winter, from breeding to farrowing time? Can a ration be made of middlings, ship stuff, or bran, cornmeal, oil meal, artichokes and potatoes? I have read quite a little, but am in the dark yet, for one will say oil meal is good; another will say it will cause abortion, and so on; what one recommends, another will find fault with. P. E. L.

Jackson, Mich.

I presume these sows in Michigan are bred to farrow very late in March or in April, so that the more careful feeding may have to be done in February and March. Up to the last month before farrowing I should feed a ration of half shorts and half cornmeal, and see that the sow has plenty of salt and ashes. If I had any roots, and P. E. L. suggests artichokes and potatoes, I should feed them to a limited extent. The potatoes will be most relished if boiled, but the unfrozen artichoke is an epicurean dish for the pig. Two or three pounds a day will do very well. I am a great believer in succulent food for brood sows, and we have fed our pigs both sugar beets and mangels at the Indiana Station for several Winters with gratifying results. We have had a root cutter, and so have fed cut roots, although it is not entirely necessary. The chief value of the roots lies in promoting a healthful activity of the digestive organs, and during lactation keeping up a milk supply. To go back to dry feed, shorts is very similar to bran in feeding value, but being finer ground, swine prefer it. Here is where one gets bone and muscle, and it should assist in creating strong pigs before birth. While we do not use oil meal, a small feed of it is advantageous. It promotes a healthful body condition, acting somewhat as a conditioner. If fed once a day in a small way, say one-fourth pound at a feed, no injurious results should ensue. Cotton-seed meal, however, should not be fed at all, to pigs of any sort, as repeated experiments have shown it to be injurious and even fatal to swine. In Winter the grain should be fed in a slop that has had the chill removed from it, and as farrowing time approaches, care should be taken to feed mainly shorts and some ground oats, and no cornmeal, and the sow's bowels should be free and natural in movement. At this time roots will come into appropriate use. I am a good deal of a believer in exercise, and a pig in Winter should be made to stir about and exercise, and especially a breeding animal, be it male or female. To crawl out of bedding to eat, and then get right back, promotes an inferior stage of vitality of offspring. A little good wholesome exercise in a feed lot for a half-hour or so is most desirable. Pigs so required to expose themselves will be less likely to take cold or suffer inconvenience in Winter, while their pigs will be stronger in consequence. If opportunity is given to root in the manure pile when the other stock is away, it will be good physical culture for the hog. C. S. PLUMB.

A LIVELY DAIRY MEETING.

Connecticut Cow Owners Meet.

PART II.

W. D. Hoard read a paper on a cow census. He had a census taken of all the cows in Ellisburg, N. Y., getting from each cow owner the number of cows kept, cost of feed, and the net returns of cows, etc. It was found that by the keeping of poor cows for the purpose, and improper feeding, that there was an annual loss of $25,000 to the town. He has since had censuses made of 100 dairies in Wisconsin, Iowa and Ohio, supplying creameries; the number of cows kept, breed, cost of keeping ration, stable accommodation and returns per cow and returns for each dollar's worth of feed. Farms right side by side were found where owners were losing constantly on cows, and their neighbors making a good profit. The second day's session was opened by a talk from H. B. Gurler, of DeKalb, Ill., on Milk for the Retail Trade. Mr. Gurler is 80 miles from Chicago, but described his business, which is making certified milk, which retails in Chicago at 12 cents per quart. On this farm everything is done with the idea of keeping dirt and filth out, rather than taking out dirt after it has got into the milk. Mr. Gurler advised the young men not to look too much for the dollar, but to the quality of what they sell; the dollar will come afterwards. He said that he carried on his business three years before any profits came. He believes in being modest in claims made, and then inviting the people to see the plan, and the fact that the dairyman is really doing more than he claims is a first class advertisement. His milk is all sold at a four-per-cent fat standard, so that it can be depended upon for physicians' use. The cream has 16 per cent fat, and sells at four times the price of milk. He believes that there is a good opening in many cities and towns for sanitary milk.

Prof. Hills, of Vermont, gave an interesting address on What Makes the Milk Test Vary? In this State, where the Babcock test is very largely used by all the co-öperative creamerles as the basis for cream buying, this is an important question, as dairymen bring it up at every Institute. Why does Smith's milk test differ from Jones's? Because of breed, individuallty, food, nervous excitement, environment, weather and period of lactation. Breed, because Jerseys and Guernseys give richer milk as a rule than other breeds. Indivlduality is equally important; families within breeds; some give richer milk than others. Food causes least varlations though still many farmers believe food affects fat production. Food affects quantity, but seldom if ever brings about a permanent change in quality. "We have in Vermont fed our cows on pure fat, but no permancnt change. We cannot persuade a Holstein to give Jersey milk." Nervous excltement affects cows, but usually only temporarily, unless the cause is permanent. Stage of lactation affects milk, as it is a well-known fact that cows farther along in milk give a higher per cent of fat. Experiment has shown that on the average the increase from calving to drying often approximates 1¼ per cent; that is to say, a milk testing four per cent at calving may test 5¼ per eent fat at stripping. The variation in test of same milk or cream at creameries is often caused by improper bottles or apparatus, or sometimes by dishonesty of rival ereamerymen who wish to take away each other's patrons. Duplicate samples tested outside or by disinterested parties will check this. Prof. Hills believes in weighing the samples of cream tested, especially in heavy separator cream; otherwise the thin-cream man may have a distinct advantage. Thick cream will not flow so readily in the pipette, and is not so heavy, and one is liable not to get the proper amount in the test tube. He believes all test tubes and apparatus should be examined by proper authorities to see that they are correct.

Officers for ensuing year are: President, H. F. Potter, Montonese; vice-president, F. H. Stadtmueller, Elmwood; treasurer, B. C. Patterson, Torrington; secretary, Geo. E. Manchester, Winsted. The creamery supply exhibit was good. I noted a model of the Green Mountain silo. The butter was scored by Mr. Bent, of Boston, and ran a little higher than last year; none below 90, 98½ being the highest. The attendance was large, especlally the first day, when the halls were crowded. H. G. M.

A "COW REPORT" EXPLAINED.

On page 14 the following report is given, showing how milk farming pays in Massachusetts:

March, 1900: Cows kept, 31 to 36; milked, 27 to 32; average, 30. Quarts of milk, 9,607, wholesaled at 3¼ cents, $312.22. Amount of grain fed to cows:

24 barrels corn and 36 bushels oats	$33.12
Grinding the same	2.40
3,950 lbs. gluten	46.65
3.100 lbs. mixed feed (bran)	29.45
Nine tons hay	130.00
Cornstalks	5.00
20 bu. small potatoes	4.00
Soft corn	3.00
Nutrltone (medicine)	.75
Salt	.25
Total cost of keeping	$254.62
Cost of keeping the herd good by trading cows	30.00
Total	$284.62
Balance In favor of the cows	27.60
Manure from cows	30.00
Total	57.00

No account was made of labor.

Out here in the State of Washington we should say that these cows are losing money. Two good men would be required to milk and care for those cows. If they get anything for their labor the cows are behind. A. W. T.

Washington.

The impression which this report gave to our Washington friend is just what I wished it to make on the farmers of our Grange, before whom I gave it, for at the time it was given there was much talk of a reduction in the price of milk. There are two ways in which to look at almost every question; take the same report and let us look it over together. In the first item of grain there are 24 barrels of corn, valued at $20.16; next the item of hay, $130, also cornstalks, small potatoes and soft corn valued at $5, $4 and $3 respectively, all of which were raised on the farm, and did not cost money out. These items foot up $162.16. Take that from $284.62, and we have $122.46, the actual sum which I paid out for cow feed during that month, and as I received $312.22 for the milk it follows that I had left at the end of month $189.76. To get the exact profit we must find out just what it costs to raise and harvest the hay, corn, etc. This I will leave each one to figure out for himself, but trust it would not cost all of the $189.76. I think my figures go to show that if a person has to buy both hay and grain at local prices there is very little profit in making milk, but if we raise our own hay, and perhaps part of the grain, there may be a little money in it.

R. N.-Y.—The farmer on the Atlantic coast usually finds a cow or some other live animal, the best customer for his grain and fodder. She gives him more than he could get elsewhere. On the Pacific coast the grain is usually sold to the dealers, and the methods followed at the other end of the country might not pay at all.

WHEN you write advertisers mention THE R. N.-Y. and you will get a quick reply and "a square deal." See our guarantee 8th page.

Numbers of prominent people too honest to impose upon others, and too sagacious to be imposed upon themselves, use and recommend Dr. D. Jayne,s Expectorant for Coughs and Colds.—*Adv.*

Curb, Splint,

contracted cord.thrush.grease heel and all forms of lameness yield readily to

Tuttle's Elixir.

Used and endorsed by Adams Express Co.

Reading Trotting Park, Mass., Aug. 31, 1899.

Dr. S. A. Tuttle, V. S.

Dear Sir:—I want to add my testimonial to your list recommending Tuttle's Elixir for curbs, broken tendons, thrush, and nails in the feet. I have used it on all of these cases many times, and never failed to make a cure. J. H. NAY.

Given internally it is sure cure for Colic, Distemper, Founder, Pneumonia, etc.

TUTTLE'S FAMILY ELIXIR cures rheumatism, sprains, bruises, etc. Kills pain instantly. Our 100-page book, "Veterinary Experience," FREE.

Dr. S. A. TUTTLE, 30 Beverly St., Boston, Mass.

Beware of so-called Elixirs—none genuine but Tuttle's.

Avoid all blisters; they offer only temporary relief if any.

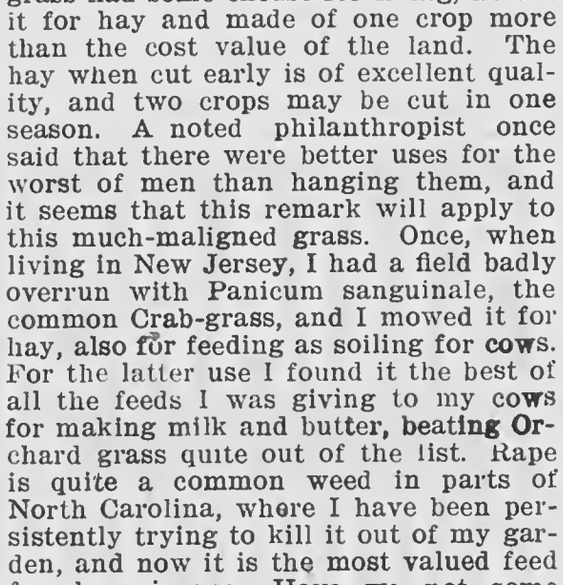
NEW YORK.

HORSE TALK BY AN OLD TIMER.

The warlike peoples of eastern Europe and Asia have long had the horse at his best, so far as intelligence, dash, spirit and other qualities desirable in a war-horse go. Xenophon lived about 2,300 years ago. He was an expert horseman, taking an active part in the expedition of Cyrus against his elder brother, the King of Persia. After his experience in war and public life, he seems to have retired to a quiet life in the country and devoted a part of his time to literary work. Perhaps something of interest in these days may be learned from this man's treatise on horsemanship. He gives some instructions as to how "a man may be least deceived in purchasing a horse." There is a bit of humor in that word *least*. Evidently horse deals then were not representations of crystallized honesty any more than now. He says that one should first look at the feet, for, "as a house without an adequate foundation is of but little use, no matter how fine the upper part, so a warhorse with badly-shaped feet is worthless, for none of his other advantages can be brought into action." Soundness of feet depends upon thickness or thinness of hoofs, and whether they are high or low before and behind, the high ones being best, as they protect the tender inside of the foot. A hoof that gives a hollow sound when struck is considered best. The bones of the leg should be thick, but not covered with fat flesh or large veins, for, when going through rough roads, the veins become distended with blood, and troublesome swellings of the legs result. Flexible knees are most desirable, as horses of this type are less liable to stumble. The arms should be large and fleshy, chest wide, and legs considerably separated, so that there is no danger of their striking when traveling. The neck should not lean forward like a hog's but be upright from the chest, and slender at the arch; the head bony with a small jawbone, and the inside of both jaws either hard or tender, for those with dissimilar jaws are hard to manage. Wide nostrils and prominent eyes render the horse more terrible in appearance (a point considered of especial importance in old-time warfare) and more vigilant. He should have high shoulder points, and broad and fleshy loins and haunches. In estimating the grown-up height of a young colt, he states that it is invariably true that the one with the longest shank bones turns out to be the largest. Though most of his rules for training refer to animals intended for use under the saddle, he gives some general principles. The foal must be made to understand that hunger, thirst and irritation are the result of solitude, and that food, drink and freedom from irritation are procured through men. Probably some misused work horses nowadays would reverse this, and prefer to take their chances in running wild. When the colt once learns this lesson, he has no dread of man. Then the groom should lead him through a crowd and make him approach all kinds of sights and sounds, teaching him by gentleness instead of harshness that whichever of these he dreads most is not dangerous. In judging a riding horse it is necessary to see how he receives the bit in his mouth, whether difficult to manage while riding, and if he can be stopped readily or turned quickly when going at full speed. However, an animal that cannot do all of these things perfectly may fail simply from lack of experience. Excessively timid horses should be guarded against, and also those that are fierce toward other horses or man. He thinks that the best stable floor is one in which tapering stones about the size of the hoof are placed close together. When not in use the animal should not stand by the manger all of the time, as he will go to his meals with better relish if he has been away from the feeding place for some time. All grooming ought to be done outside, and he considers it a good plan to have the outer yard covered with several loads of round stones, as standing on these part of a day gives him about the same exercise as going over a stony road. He protests against using the currycomb on the parts of the horse where the bones come near the surface, brushing or washing being the better plan. Hundreds of horses that suffer needless torture by being scraped on the head, backbone and legs by a rough currycomb handled by a still more rough human being, would appreciate the mode of cleaning suggested by Xenophon. The brutal treatment they receive is what makes many horses in such dread of being cleaned. Those that are not hurt needlessly enjoy this dry bath. There is a great difference in horses about this also, and those that are very nervous or thin-skinned should have most consideration. He believes also in allowing a horse to have his full mane and tail, as these were given him by Nature to help in removing flies and other troublesome things that he cannot get at in any other way.

SOME NOTES ON STOCK FODDER.

THE R. N.-Y. asks what price silage brings at an ordinary sale. Some time ago—I think about the time THE R. N.-Y. asked the question—a lot of silage was sold in Illinois for 60 cents a ton. A fair price, I think, for the seller, considering the difficulty and cost of moving it. I don't think I would have given that price for it, and moved it. In the same issue THE R. N.-Y. calls the cow an agrostologist; that is, an authority on grasses, scientifically speaking. My cows and mules when turned loose in a five-acre lot kept for an exercising ground chiefly, I notice are eating the bunches of the so-called broom sedge which have come up green and fresh after the mature grass has faded and dried, in preference to the Timothy and clover; the mules especially gnaw it down to the roots. In the Spring the sheep feed wholly on the first growth of this sedge in preference to all other grass. A farmer in North Carolina who came from a northwestern State, and bought an old run-down farm covered with the much-maligned Johnson grass, Sorghum Halapense, wrote me that after a good deal of trouble in trying to get rid of it, finding it to grow faster and more luxuriously the more he tried to kill it, thinking that such a persistent grass had some excuse for living, he cut it for hay and made of one crop more than the cost value of the land. The hay when cut early is of excellent quality, and two crops may be cut in one season. A noted philanthropist once said that there were better uses for the worst of men than hanging them, and it seems that this remark will apply to this much-maligned grass. Once, when living in New Jersey, I had a field badly overrun with Panicum sanguinale, the common Crab-grass, and I mowed it for hay, also for feeding as soiling for cows. For the latter use I found it the best of all the feeds I was giving to my cows for making milk and butter, beating Orchard grass quite out of the list. Rape is quite a common weed in parts of North Carolina, where I have been persistently trying to kill it out of my garden, and now it is the most valued feed for sheep in use. Have we not some uses for these persistent weeds which we are trying ineffectually to eradicate? Several years ago I got some of my fields here well stocked with the ox-eye daisy, and after years of unavailing work I gave it up and put my sheep in the field. Now in three years the field has not a living daisy in it, and the sheep thrived on it. H. S.



MICA AXLE GREASE
Makes short roads. And light loads. Good for everything that runs on wheels.
Sold Everywhere.
Made by STANDARD OIL CO.

Get Bigger Crops and still Sow Less Seed.

You can do it if you use the CAHOON Broadcast SEEDER really the most practical hand seeder made. Saves four-fifths of the labor of seeding and one-third the seed.
Insures a bigger crop because it distributes the seed evenly.
Any one can use it. Sows 6 to 8 acres per hour. Ask your dealer for it. Send to us for discriptive circulars.

HEN PARTNERS THAT PAY.

Ripe Results from a "Greenhorn"

I send you a transcript of my poultry account for the year 1900, which I think is a remarkably good showing. Poultry on hand January 1, 120; this was reduced by sales of old hens in the Summer to 80, the average number kept during the year being about 100:

Number of eggs laid	17,677
1,265 dozen eggs sold	$279.65
Poultry sold	40.39
Cash receipts	$320.04
Poultry consumed	13.00
Eggs used in family	10.00
Total	$343.04
Feed bill, which includes grain for horse, hog and two cows	169.52
Total	$173.52
Increase of flock	30.00
Value of manure	20.00
Profit on 100 hens	$223.52
To this should be added value of grain fed to horse, cows and hog, at least.	69.52
Total	$293.04

This shows a profit of nearly $3 per hen. My hens are White Wyandottes, and a cross of White Wyandotte hens with a White Leghorn cock. The lowest number of eggs laid was on January 5, 14; the next lowest was on November 7, when they only laid 20 eggs. The highest on any day was 83. The panic of 1893 closed the factory in Brooklyn, N. Y., where I was employed, and I came up here in northeastern Connecticut and bought a farm; being as "green" about farming as a man born and brought up in a city could be. None of the family knew how to milk, I had never plowed a rod, was 57 years old and slight of physique, but we have made a success of it. None of us would go back to the city to live if we could. I have built a cow barn, wood and wagon sheds, added a room to the house, built six poultry houses, planted 500 peach and plum trees, and wouldn't sell the farm for less than twice what I paid for it.

The above is written for the encouragement of the mechanic, clerk, salesman, who reads, in the eye of the manager or superintendent as he passes by him: "I guess it is about time to put a younger man in your place," and who has saved $1,000 or $2,000 to show him that a good living *can* be made by an industrious man on the cheap farms of New England. In this locality $700 to $1,000 will buy a good *supporting* farm, where a worker can make an independent living. Where, from lack of money, a heavy mortgage has to be carried a man is handicapped, and has to scratch much harder to pay interest and still make a living. I wish to add in closing that a large share of whatever success I have attained is due to the wise and careful management of the "Madame."

Willington, Conn. G. A. C.

The Guinea Fowl.

There are two varieties of Guineas, Pearl and White. There is no difference in their characteristics save in their color. The Pearl variety should be bluish-gray in color, each feather covered with white spots resembling pearls, hence its name. It should be free from any white, or partly white, feathers in any part of the plumage. The neck is covered with black hairs near the head and between that and the feathers is a soft down, of a light brown color, that glistens in the sun. On the top of the head is a horny spike that turns backward. The bill and legs are brown. The White variety should be a pure white in plumage with a yellow, orange or yellowish-white bill and legs, this being the only difference between them and the Pearl variety. Some birds of the Pearl variety have white feathers in the breast and wings, but are mongrels, being a cross between the two varieties. They are great foragers, and will pick up enough bugs and injurious insects more than to pay for themselves. They do not stand confinement well, and will not lay more than one-half as many eggs as if allowed to run at large. If fed regularly morning and night they will always be on hand for their share. They desire to roost in trees near the barn at night, but are most excellent guards either night or day; anything out of the usual astir, they will set up a great cry. They roost so high that they are out of the way of thieves or wild animals. In their wild state they will fight and drive other fowls, but if used kindly as other poultry, they will stay and feed with the other fowls without showing much of this pugnacious habit. But if any other fowl wish to fight, the Guinea cock is always ready for the fray and never comes out second.

The Guinea hen is a Spring and Summer layer and lays from 90 to 120 eggs yearly. They like a secluded place to lay in. When their nests are found, leave two or three eggs, or they will leave the nest for another place. I have had them lay in the nests with hens. Better set their eggs under hens to hatch, as the Guinea does not sit until too late in this latitude to have the young get grown before Winter. Besides, if raised by common hens they can be taken care of better, for they must be fed often, as the young eat but little at a time. Fifteen to 17 eggs can be set under a good sized hen and with good care all can be raised. Their eggs are small, but make up in quality what is lost in size. Their meat is excellent and has a gamy flavor. The cocks can be distinguished by their screeching noise, also by the spike on their head being larger, and by holding their heads higher. Their ear tubes are larger, and generally curl in a sort of a semicircle toward the beak. The hens make a noise that sounds like "too quick," and seldom screech. They are a profitable fowl for the farmer to raise. H. A. J.

Worcester, Mass.

OATS AND HENS.—I have seen so much in THE R. N.-Y. about feeding oats to hens, that I think I will have my say now. I have fed them for years, and think them a good feed, and no more likely to kill hens than any other grain. No matter what you feed, occasionally a hen will die. I think I get more eggs and lose no more hens than those who feed no oats. Last year I had 60 year-old hens and 30 pullets, and they laid during the year 11,468 eggs. The hens were fed a mash of two-thirds coarse bran and one-third cornmeal in the morning, and at night about three-quarters dry oats and one-fourth corn. In cold weather the mash is fed hot, and the oats and corn warmed. When the hens cannot run out, at noon a little cracked corn is scattered in the litter on the floor to keep them busy. They do not have any other kind of grain or meat, or any hen food. Warm water and ground oyster shells are kept before them all the time, and they have thick sour milk about every day. Whole apples are also given them two or three times per week. I do not think you can find a healthier or brighter lot of hens, and I shall keep right on with the oats.

Dover, N. H. W. E. R.

EGG EATERS.—Two Winters past I have had some trouble with hens that eat eggs. Along in December and January some hens will lay a few eggs, and in spite of all I can do they are as liable to place the egg on the floor as anywhere. Then if the hens are at all accomplished, as some hens are in almost every flock, they will quickly go at every egg they can find and eat it. The very best thing I have ever tried is to place earthen eggs about, and let the hens try their skill on them. But after they get a taste of real eggs it is pretty hard to discourage them. This year I placed the eggs about the floor early in the season, before the hens begin eating eggs. Of course I try to furnish such food as they need. This year I haven't had an egg eaten so far as I know. The generous "feed" of earthen eggs in season did the good work, I am certain. It is no matter now if some hen of perverse nature does deposit an egg on the floor; the others have had their ambition for egg-eating so blunted by those hard-shelled eggs that they don't molest any.

H. H. L.

LIME IN THE HENHOUSE.—There was a certain odor in one apartment of my henhouse that was disagreeable and, I feared, emanated from a source of danger. After trying the clearing-out method several times with little effect, I decided to use lime. Lime is a good cleanser truly, but I dislike to use it where there is much hen manure, for it will cause the manure to decompose, liberate its ammonia, and thus add to the nuisance besides spoiling the manure. By clearing away everything on one side away from the roost, and sprinkling air-slaked lime evenly over the floor, the odor was completely annihilated and the manure not injured. A friend who says he has no sick hens uses lime every day in his henhouses. He clears out all droppings every morning, and sprinkles in the lime. This, doubtless, is good for the hens, but, I fear, bad for the manure. To be sure, one keeps hens for what the hens pay, and not especially for the manure, but by careful managing the lime can be used to a limited extent with little injury to the fertilizer. H. H. L.

A PRACTICAL POULTRY BOOK One which covers every detail of the industry from incubation to market is our 20th CENTURY CATALOGUE. It will teach you from the practical experience of others what it would take you ten years to learn. Among other things it tells about the latest improvements in the world famous Reliable Incubators and Brooders. Sent for 10c to pay postage. Reliable Inc. & Brdr. Co. Box B-107 Quincy, Ill.

"Profitable Poultry Keeping
IN ALL ITS BRANCHES." This is the title and theme of our new Year Book. Contains 192 pages, 8x11 in.; 200 new and original illustrations of best poultry farms, buildings, etc. In the country. Deals with every phase of the poultry industry in an instructive and profit bringing way. Treats also of the famous non-moisture, self-ventilating and regulating CYPHERS INCUBATORS, guaranteed to outhatch any other in three or more tests or money refunded. Sent for 10c in stamps. Ask for book 101. Circular and prices free. Address nearest office. CYPHERS INCUBATOR CO., Boston, Mass., Wayland, N. Y., Chicago.

"THE POLAR CREAMERY."

One of the Worst Fakes Yet.

There has been a salesman, traveling through this part of the country, selling what he calls Polar creameries. He says one can make butter in Summer same as Winter, and not use ice. He claims that the creameries are filled with a material that will prevent water from getting warm; they can be used in the kitchen, or out on the porch in warm weather. The price is $68, and the agent has sold quite a number, and claims that the buyers are getting them on trial for three months. Before he leaves he has them sign two articles of agreement and a note; still they are only on trial, and he takes a neighbor with him, who has bought one and is better known to the people than the stranger, and in that way he has made several sales. In two weeks after he makes a sale an inspector comes; he says to inspect creamery, but in my estimation he is inspector of the notes, and if a party is not reliable the machines are shipped away. I think the whole thing is a fraud, and that they are humbugging the people. He sold 10 while stopping with this neighbor. I have no thought of buying one. I feel sorry for some of my neighbors who did not understand, and feel that they are humbugged, as they say they all make the butter and milk taste, and if there was any way to get rid of the implement they would not buy at any price. B. S.

Clifford Co., Pa.

Have you any knowledge of the Polar creamery? It is a new thing in this territory, and I am afraid it is too good to be honest. It is to keep milk on the porch of the house, Summer or Winter, at the same temperature without ice. The agents say that the outside temperature of the air has no effect on it, as it is controlled by a nonconductor. J. L. M.

Elton, Pa.

We give our opinion of this on the editorial page. On the face of the claims made for it this "creamery" is a rank fraud. We are surprised that farmers who are in their right minds should buy any such thing. This plan of getting some "prominent citizen" to go around and play Judas with his neighbors is an old one. The country is full of humbugs just now, and most of them look fat. The latest thing we have heard about is a powder for taking the flavor of onion or garlic out of milk. Instead of putting this into the milk we are to put it into the cow—feed it in her grain! Why can't they let the cow alone, anyway?

PRIZE BUTTER IN NEW YORK.

The following reports are made by creamerymen whose butter scored high at the recent meeting of the New York State Dairymen's Association:

The butter exhibited at Watertown was made from milk delivered December 3, the larger part of it being two days milk delivered by 43 patrons; the cows are principally grades of different breeds, with quite a percentage of Jerseys. Twelve of our patrons have silos, and over one-third of the milk, I think, would be silage milk. I believe good silage is the very best of food for a milch cow. We separate our milk with two of Reid's improved long-spindle separators, and in the Winter Pasteurize the milk at about 160 degrees with Reid's Pasteurizer before separating, send the cream over a cooler, and cool immediately to about 70 degrees, then gradually to about 56 degrees, where it is held for 48 hours and then churned. A pure culture starter made from Hansen's lactic ferment is added to cream when we start separating. We use Thatcher's butter color. I believe the high scoring of the butter at this time of the year was due to Pasteurizing of the milk.

Chipman, N.Y. THOS. F. RUTHERFORD.

Our creamery was built and opened June 28, 1899. It is situated at Medusa, near the foothills of the Catskill Mountains. This is a very fine grazing country, although the farmers are not up-to-date in dairying. The herds are quite well mixed with Jerseys, as our tests will show, the butter fat averaging from four to six per cent. From two to 20 cows comprise the size of the dairies. During the Summer months we received milk from 75 patrons. Of these, only one feeds silage, which is one disadvantage to the creamery, as I consider silage the best feed for milk, quantity and quality considered. Badly-tainted or impure milk is rejected. The proper way for farmers to guard against tainted milk is by cooling and aerating as soon as it is drawn from the cow. The milk that made the butter scored at the convention held at Watertown was delivered to the creamery every other day, the butter being made on the last days of November. As we use Reid's improved Danish separator and Pasteurizer, the milk was Pasteurized, passing through the separator at a uniform temperature of 76 degrees. The cream passed over a corrugated cooler which cooled it down within two degrees of the water. The cream of this butter was further cooled down to a temperature of 45 degrees; then reheated to a temperature of 80 degrees. We used a ferment starter to ripen the cream, which takes from 12 to 14 hours, the cream being churned at the temperature of 45 degrees, taking about 45 minutes to churn. T. C. HARVEY.

Butter Left in Cream.

P. C. S., Katrine, Kan.—After I churn and take out the butter there are little particles of butter floating in the milk. What causes this?

ANS.—Either you are not churning quite long enough, or else your cream is not all of the same degree of ripeness. All cream to be churned together should be thoroughly mixed 12 hours before churning. The smooth velvety appearance of properly-ripened cream is not easily described. If you have succeeded in obtaining it, churn at such a temperature that the butter will come in from 30 to 40 minutes. The churn should be stopped when the butter is in granules about the size of Winter-wheat kernels, and the buttermilk has a thin bluish appearance. If the previous conditions have been right, there is a point at which the butter, although still in granular form, will float in a mass on top of the buttermilk. The buttermilk is then drawn off from beneath it, a wire strainer (50 meshes to the inch) being used to catch any granules that may come with it. The butter should then be washed with cold water; two or three washings will usually be sufficient. It is then ready for salting. J. A. F.

Ripening Separator Cream.

C. B. S., Stone Ridge, N. Y.—Does separator cream require any different process of ripening from deep water or pan-setting cream? I have a separator, and one of my neighbors has one, and I notice his butter and mine does not keep, but gets strong in a short time. I formerly used a creamery, and had no such difficulty.

ANS.—Separator cream requires the same process to ripen it as cream raised by the deep-setting or shallow-pan systems, and will, we believe, make equally as good if not better butter, when all other conditions are the same. Taking it for granted that the *utmost cleanliness* has been practiced without bringing a solution of the trouble, may be that C. B. S. has been overripening a part or the whole of his cream. All the cream to be churned together should be thoroughly mixed at least 12 hours before churning, in order that the lactic acid may be equally distributed throughout the whole mass. If too much lactic acid is allowed to develop, that is, if the cream becomes too sour, the casein may become firmly coagulated. Upon churning, this breaks up into minute particles, and becoming incorporated with the butter makes an excellent medium for putrefactive fermentations, which cause bad flavors. The lactic acid should not exceed fifty-eight one-hundredths per cent (.58) as determined by Farrington's alkaline tablets. To make a butter that will "stand up" well under adverse conditions of temperature, it seems to be necessary that the cream should be subjected for several hours to a temperature at least as low as 50 degrees Fahrenheit. In the deep-setting system this has already been accomplished when the cream is run off, but with separator cream the case is different, and it should be allowed to stand for several hours at a temperature of 50 degrees Fahrenheit before churning. All changes in the temperature of cream for butter-making should be made gradually. A thorough sterilization of all utensils with live steam, every day or at least as often as used, is to be recommended. J. A. F.

NEXT TO MURDER

A doctor, who keeps his patient at home, when he ought to send him away—for money—ought to be held responsible

So ought we, if we mislead Our offense is greater than his, because we endanger thousands of lives by one advertisement—millions read it.

Some few must go for a change of climate, or die; but to thousands, Scott's emulsion of cod-liver oil is cure at home.

We'll send you a little to try if you like.
SCOTT & BOWNE, 409 Pearl street, New York

Built best, work best, are best; with every test they prove the best. The McCormick light-draft Binder is the binder by which the merits of all other binders are judged. The points in which it leads all other makes are great capacity, simplicity, durability, and light draft. The McCormick Binder gets all the grain.

The McCormick light-draft Mowers are the cleanest cutting, farthest going mowers. Other mowers are built to *look* like the McCormick, but they do not *work* like the McCormick. The McCormick Mowers get all the grass.

McCORMICK

The McCormick light-draft Hay Rake is everything that a farmer can ask for in a rake. It is neat, it is strong, it is the rake you want. The McCormick light-draft "Daisy" Reaper is the best reaper you can put on your farm. The McCormick light-draft Corn Binder is the only truly successful corn binder. It is stiff, it is strong and it binds the corn as it stands, which is the only successful way—this way is our patent. The McCormick Corn Husker and Fodder Shredder is a medium sized machine with large capacity. It is a little giant, Many buy it for job work. It is the surest money-making shredder on the market. The McCormick Twine is spun by the most modern machinery and passes the most rigid inspection. McCormick light-draft Header is the very best ever put into the field; instead of six horses you only need four with this machine. McCormick Knife and Tool Grinder is a great advantage to every farmer. A sharp knife saves draft. It is quickly changed to a general tool grinder.

The McCormick Harvesting Machine Co., Chicago, has the greatest honors, the greatest sales, and the greatest works in the world.

Ailing Animals.

ANSWERS BY DR. F. L. KILBORNE.

Influenza or Acclimation in Horses.

What is the matter with my horses? They first become stiff in the legs and suffer from cramps, acting as though they are sore all over. They now stand with their eyes almost closed, and water and matter running from them. The horses were brought five weeks ago from Indiana to Oklahoma. Is it a common disease, or caused by change of climate? W. W. T.
Cloud Chief, O. T.

The horses appear to be suffering from influenza, or as it might be termed in cases of this kind, acclimation fever, brought on by the change in climate. If the horses are very sick, or appear to have much fever, it would be well to call a competent veterinary surgeon at once; if there is one available. Owing to the severity of some cases, and the complications that are liable to arise, severe attacks of the disease can be satisfactorily treated only under the personal direction of the practitioner. Mild cases require very little medicinal treatment. Good nursing, comfortable quarters, and a nutritious, laxative diet, such as bran and flaxseed mashes, with a little green food, is about all that is necessary. If the attack is more severe, with high fever and prostration, give one ounce each liquor acetate of ammonia and sweet spirits of niter with one dram fluid extract of belladonna in a half-pint of cold water, and repeat two, three or four times daily, according to the severity of the symptoms. If there is constipation give rectal injections of warm soapsuds several times daily, and pint doses of raw linseed oil, as often as may be necessary to keep the bowels moving freely. Unless the stable is very warm, the animals should be blanketed and the legs, if cold, rubbed and bandaged. If catarrhal symptoms develop, steam the head once or twice daily, adding a little pine tar or turpentine to the boiling water, over which the head is steamed.

Horse Out of Condition.

What ails my horse, and what will cure him? He is rather thin in flesh, slightly costive, drinks three times a day, but little at a time; does not go well on the road, going as though tired or lazy; eats well, two quarts oats and a moderate amount of hay three times a day. I do not work or drive him a great deal. Will poplar bark take the place of gentian or golden seal in horse medicine? H. L. C.
Winchendon, Mass.

Try the following powders: Powdered nux vomica and aloes, of each four ounces; powdered gentian, nitrate of potash and ginger, of each eight ounces, mix and divide into 32 powders. Give a powder in the feed twice daily. Should the horse refuse to eat the feed, mix the powder thoroughly with the feed, and then just before placing it in front of the horse, rub a little of the powder on his nose, when he will usually eat it without further trouble. No. The poplar bark will be more of an astringent, while the gentian and golden seal are bitter tonics.

Small Orifice in Heifer's Teat.

We have a fine young Jersey cow with her first calf, that gives promise of a good milker, but the orifice in the two front teats is so small that with all the pressure the stream of milk is no larger than a knitting needle. The two back teats are comparatively easy to milk, and we are compelled to let the calf milk the front ones. What remedy would you suggest?
Manchester, Va. H. E. H.

If a veterinary surgeon were available the most satisfactory method would be to have the orifice dilated or opened by him. In the absence of the veterinarian you can probably dilate the opening with a milking tube. Procure two milking tubes, and after milking the cow (with the tubes if you will), plug the tubes to prevent leaking of the milk, and insert a tube in each teat. Tie them in position with a piece of tape, to prevent their dropping out, and leave them until next milking, when you can either remove the tubes to milk the cow, or milk her with the tubes. Keep the tubes in the teats until the opening is sufficiently enlarged to milk as freely as desired. Do not leave the tube in the teat longer than necessary, because of the danger of causing the cow to leak her milk, by dilating the orifice too much.

Contracted Tender Feet on Horse.

What shall I do for a horse with tender and contracted feet? J. S.
Brooklandville, Md.

Blister the coronet all around the top of the hoof with ammonia liniment, and repeat two or three times at intervals of four to six weeks. Paint the hoof two or three times a week with a mixture of equal parts of pine tar and vaseline melted together. You would do well to have the horse shod under the personal direction of a competent veterinary surgeon.

FEEDING MOLASSES TO STOCK.

In the morning, after milking, we feed hay, and about 9 o'clock turn the animals out to drink, while cleaning the stable, then put them back, but if the weather is warm and very pleasant perhaps leave them out an hour or so, but not longer. We now scatter three scoopshovelfuls of beet pulp on to the hay, orts usually. We put enough hay in so there will be a peck to a half-bushel of orts in each cow's manger. We sprinkle on a pint or more of waste beet molasses thinned with about the same amount of water (as the molasses is very thick) to each cow, then scatter gluten, buckwheat middlings and wheat bran on it, and to the cows that are intended for beef add more or less cornmeal so that when they fail to give milk in paying quantity they will be good beef. To the dry cows coming in, and young heifers, we give mostly wheat bran; perhaps a little meal if they are thin. At night we turn out again for drink, clean the stable, and sweep the mangers, and if any orts are eatable give them to the horses. After milking feed hay again, then after supper give pulp, molasses and grain as in the morning, but a little more.

We have practiced this system of feeding many years, regardless of the kind of feed used. It requires considerable time, but I think it pays well for extra time spent in caring for cows. I will say here that in the Spring we keep our cows in the stable nights until the weather is warm all night, and turn out days until the flies get troublesome, when we change, turning out nights and keeping them in days. In either case we feed hay and silage until we have some kind of grass feed to cut, also feed some kind of grain through the year. We are feeding four horses whole straw, clean their mangers twice a day, cut the orts and take about one-half bushel of them and pour on nearly a quart of molasses and a little water; stir it, when every piece of straw will be sweetened, put on a quart of wheat bran and two quarts of rye, oats, barley and corn ground together, stir it in, and they eat every piece of it. As to the actual worth of the molasses, I am not able to determine yet, as we have only fed it about three weeks, but this I can say of it, that all of our stock like it, and will eat almost anything with it that otherwise they would not touch. Our cows are giving at the present time as much or more milk as any time last Fall or Winter, although the weather is quite cold.
Whitney's Point, N. Y. J. P. C.

HAND-RAISED PIGS.—The picture on page 35 of a hand-raised pig is very sweet indeed. Piggy looks so cunning, with such a charming curl to his tail, but it takes too much time if the Missy's time is worth anything. I raised six pigs once that were left motherless at three days old. We were young at farming, and fed the mother too much, and she crawled under the barn and died. My husband said, "Now I might as well kill the pigs too." I couldn't bear that, so I asked whether I could have them if I could raise them. "Why yes, take 'em along." I fed them with a spoon five times, being careful to hold their noses close to the basin of warm steaming milk. After that they would put their little noses in the milk and drink. I made them a pen near the back door, put in a pile of straw, and fed them five times a day and once in the night for four weeks. The night feeding was not very pleasant, as it was in the month of April, and I often dreaded to get out of a warm bed to feed them, but they fully repaid me when they went to market in December, being the finest pigs on the farm. HELEN.

LIVE stock is in good condition and doing well, but there are not as many cattle and hogs feeding as usual. Very little snow, but grass is looking well; wheat badly damaged by fly in the Fall.
Reading, Mich. E. A. D.

WE have never fed silage to hogs nor any stock. As to clover, we have fed plenty of the hay to hogs. While it will not take the place of grain, it assists in keeping the hogs in a good healthy condition, and also furnishes some nutriment. It is of the same use as grass, but not so succulent. J. H. DUXBURY & BRO.
Minnesota.

BOTTLE PIGS.—I was very much interested in your cut of the hand-fed pig. Several years ago I had left on my hands, by the death of the mother, eight pigs one day old. I had never heard of its being done, but thought I would try bringing them up by hand. They were put in a corn basket, kept in a warm place. For feeding I used the rubber from the end of a medicine dropper. I never saw anything grow faster, and it was actually a pleasure to put them on the floor at feeding time and see them follow me around. They all became fine porkers. J. R. S.

JERSEY CALVES.—Evidently the man who does not succeed with Jersey cattle and prefers other breeds is simply very narrow-sighted, or does not have the right kind of Jerseys. I have now four calves that I am raising on skim-milk and meal, that are six weeks old. They are good veals, and would realize me to-day $32, and I have before now sold veals under the same condition and age for $10 per head. I don't find my Jerseys dainty, kickers, etc., but are very docile, gentle and not at all nervous. My experience with Jerseys is that they respond to good treatment wonderfully. C. C.

Remittances may be made in money order, express order, personal eheck or bank draft.
THE RURAL NEW-YORKER,
409 Pearl Street, New York.

SATURDAY, FEBRUARY 9, 1901.

NEXT week we shall print a well-prepared article on Japan plums by H. O. Mead, of Massachusetts. Mr. Mead has studied the Japan plum at both ends of the country. He lives in the town where Luther Burbank did his first work, and he has visited Mr. Burbank in California. What he says about plums may be set down as solid and straight. Of course we have more of these "essential-principle" articles on the way.

*

THE New York Assembly passed a resolution favoring the Grout bill, but the Senate hesitated because State Senators "should not instruct National legislators!" Why not? These State Senators are supposed to be the servants or agents of the people. They are not supposed to create public sentiment, but to register and express it. Some very big men before now have lived to be thankful that they were "instructed" by very small ones!

*

GOV. ODELL, of New York, in his message to the Legislature, said that the work of detecting and slaughtering tuberculous cows should be taken from the State Board of Health and put in the hands of the Commissioner of Agriculture. That was one of the few suggestions he made about agriculture. The House has promptly passed such a bill, and the Senate will doubtless do the same. This is right. It should have been done last year. The cow should be put in the hands of her friends.

*

THE doctors appear to agree that insanity is a disease. Many forms of this mind disease are curable, but our observation is that comparatively few patients have a fair chance in public institutions. There are institutions for the care of the insane that are truly hospitals. Others are as truly jails. Life inside some of these great palaces is well calculated to take away the last hold upon reason which some poor, nervous wretch is attempting to retain. If the State really desires to *cure* the insane it should separate them into groups, and keep them in smaller companies on the farm as much as possible.

*

DURING the past two months, the newspapers have reported an unusual number of casualties caused by thawing dynamite or giant powder on a cook stove. In most cases the victims were farmers, who purposed using the explosive in clearing land, though some disastrous explosions occurred where the stuff was handled by men making a business of such work. The fact is that no powerful explosive can be regarded as "safe"; that is, it must always be handled with the greatest caution, and familiarity must never degenerate into carelessness. Such materials are often a great aid in clearing land, but their dangerous character must never be overlooked for a moment.

THERE is a new class of would-be farmers large enough to merit special attention. They are mostly men of middle age who are being crowded out of city jobs by the hard fist of competition. Many a man of 45 or older wakes up some day to find that he is considered "an old man," and that his job demands younger blood. Usually it happens that when such a man loses his grip in the city he cannot fasten it again, and the outlook is a hard one. Many of these men turn to the country as a last resort, and we receive many letters from such people asking what the chances are for them on a farm. There is so much of this appeal for help that we plan to print a series of letters giving the experience of some who have tried the country. One of these letters is found on page 91 by a man who has succeeded. There are some who fail—we hope to tell why.

*

WE are receiving a good many sample contracts offered by canning factories. The grower is certainly tied up with a tight knot in most cases. He seems to assume most of the risk. In the case of wild-cat canners he takes it all—and often gets nothing else. What we are most anxious to learn is the price offered for peas. There is every chance that canned peas will rise in price. If the canners get more for the peas, the grower should certainly share the increased price. The Green pea-louse will make the grower's risk greater than ever, while it means no extra risk to the canner.

*

ILLINOIS dairymen are much dissatisfied with the present law regarding inspection of cattle suspected of tuberculosis. They consider that the cattle should be appraised at full value at time of examination, the owner to receive full value if, after the animal is slaughtered, it is found to be healthy, and 75 per cent of the value if the disease is present; that no animal shall be condemned without the owner's consent, in writing, unless it shall be found diseased on examination, and that no animal shall be slaughtered without the owner's consent, after the State appropriation for compensation is exhausted. The dairymen feel that the present law is unjust and oppressive to them, and their concerted action seems the readiest way to a remedy.

*

No section of this country is so sadly in need of the fertilizing and civilizing influences of the dairy cow as the old cotton-growing States. The cow has saved whole counties in the North and West. Year after year of grain growing had exhausted the soil, and brought farming to a low ebb. Dairying gave the farms a new lease of life, and made them once more profitable. The dairy cow, with a wise man for a partner, means prosperity to any section naturally adapted to the production of forage plants. She means a constant and sure income, and after all the dollar is a mighty agent for civilization. The farmers of the cotton States need available fertility in their soil and available dollars in their pockets. The cotton bale rests too much on the fertilizer bag, and the lump of cotton money is badly melted before it reaches the grower. The dairy cow has found her place in a few southern localities, notably at Starkville, Miss. The more cow, the more corn, cotton, comfort and cash. That has been the invariable result. Why do we speak of this? Because the two Senators most active in opposing the Grout bill in the Senate committee represent the cotton States! It is hard to understand why such men should be willing to cripple an industry like dairying, which, if intelligently conducted, would add millions to the wealth of their section.

*

A LEADING peach expert, while lecturing on peach culture, was asked what varieties to set. "Don't plant Elberta!" was part of his answer. After the meeting a large peach grower said to the writer: "Elberta is the best selling variety I have! People call for them! If instead of the varieties he mentioned I had planted more Elbertas I would have made $2,500 more on last year's crop!" In Massachusetts a well-known fruit grower from a distant State said: "Don't plant the Baldwin apple. It is a back number! There are better varieties of red apples." A man who heard the advice said nothing, but did much thinking. He had in his desk at home commission returns for Baldwins which sold at $6 to $7.50 per barrel! How can such things be reconciled! In the case of the peach the expert may know that millions of Elbertas have been planted, and that within a few years the markets will be swamped with that variety. As to the Baldwin apple, in its native State it must be either a very wise or a very *un*wise man who would claim that he has a better red cheek! It all comes down to the fact that the man and the locality have more than anything else to do with varieties. General advice is useful, but, after all, the successful local orchard is the best object lesson.

*

AN evident fraud has come to our notice in Pennsylvania. It seems that an agent is traveling through the country districts selling what he calls the Polar creamery. The creameries are supposed to be left on three months' trial, but to begin with the would-be purchasers sign two articles of agreement and a note. The machine is guaranteed to keep milk at a low temperature, Summer or Winter, without ice, and regardless of whether it stands in kitchen or dooryard. This special and unique feature is claimed to be due to some substance which when mixed with water, regards with impunity the sizzling heat of the Summer sun or the chilling blast of an imported blizzard. Physicists do not know of a substance in this wide world that is an absolute non-conductor of heat. The claims made for this new Polar creamery would lead one to suppose that such a substance had been found, and not only found, but that its cost was such that it could be used in the manufacture of every-day apparatus. As the chief value of this new creamery is in keeping milk cool during warm weather, we would suggest to intending purchasers—if there be any such among the readers of THE R. N.-Y.—first, that they begin their three-months' trial about June 1, and second, that they sign no agreement or note until the trial has proved satisfactory. We cannot think that any intelligent farmer will be foolish enough to believe any such statements. It might be well to turn the light on some of those Polar agents by polarizing them with a bean pole.

*

WHAT has become of the Grout anti-oleo bill? The plan of the oleo men was to delay it in the Senate committee, but this did not work, for finally that committee reported favorably to the Senate. This report contained the following chunks of argument:

> The bill appears to be unanimously desired by the farmers of the country who are engaged in dairying, and has the earnest approval of the Secretary of Agriculture. Your committee has listened with interest to the representatives of the live stock interests and the cotton-seed oil manufactures, and is unable to see in this measure anything that can greatly injure either. The Secretary expressed the opinion before the committee that the dairy cow was a necessity to the restoration of the exhausted cotton lands of the South. We have heard some objection to this measure from organized labor, and while it is true that some laboring men may prefer as a matter of pride to consume oleomargarine that is yellow instead of white, yet your committee believes that while the pride of some may suffer under this measure, which will raise the tax in the colored and reduce it in the uncolored, a far greater number are now being deceived through the sale of oleomargarine as butter and at butter prices.

There you see the good effect of the thousands of letters that were mailed to Senators. The farmers of this country have been sticking millions of postage stamps upon their Members of Congress. Will the bill pass? We believe it will, if it can be brought to a vote. The Senators are wrangling over several important measures, and unless strong pressure is brought to bear upon them the Grout bill may be held back. Keep up the letter writing! Stick on the postage stamp! That is the best advice we can give now. If you have written once before, write again and ask why the Grout bill is not brought to a vote!

*

BREVITIES.

RURALETTES.

Hopeful his outlook—he perchance may grow
The man who dares to say "I do not know!"
But cursed is he, and great will be his fall
The pompous wretch who thinks he knows it all.

*

The politicians are on deck,
Would that the plague might take 'em;
With great pretense of statesmanship
They break laws when they make 'em.

*

The apple that carries a big fat worm
Into the mouth of your friend the eater,
May safely be labeled an evil germ,
Working his feelings to call you "cheater."

*

Show me the man who stands right up in church
And says he never, never "made a break,"
Or sought amendment for some moral lurch,
And you will find an angel or a "fake."

*

He talked for half an hour—told all he knew—
And then sat down? No, poor, inflated fool!
He told it o'er again—alas! 'tis true!
He's made his tongue a plaything—not a tool!

*

Your tongue may never reach your Congressman
Except by licking o'er a postage stamp;
Sometimes the blackest ink, well written, can
Illuminate his pathway like a lamp.

*

Seventeen manufacturers painting oleo,
Selling it for butter—see their wallets grow!
Five million dairymen, fighting for the cow,
Sticking on postage stamps—stick another now.

WE know from experience that Mr. Hinman's plan (page 83) of feeding green cut oats in place of horse hay is a good one.

A FEW weeks since a Californian told us about his Winter work. Now read the doings of that cold country resident on page 97.

Events of the Week.

DOMESTIC.—A fire in Montreal, Canada, January 23, destroyed the Board of Trade Building and many places of business. The losses are variously estimated at from $4,500,000 to $6,000,000. . . . . O. B. Wilson was talking over a telephone in Alabama during a thunderstorm, and was struck by lightning and killed. Suit was brought for damages and settled by the payment of $1,800 by the telephone company. . . . . The Creek outlaws are terrorizing several white settlements in Indian Territory, and military protection is called for. . . . . Fire at Matawan, N. J., January 27, caused $100,000 damage. . . . . January 26, safe breakers robbed the vault in the headquarters of the Internal Revenue Department at Peoria, Ill., and secured all the documentary stamps in the vault. The extent of the loss is unknown, but may be anywhere from $50,000 to $1,000,000. . . . . A fire in a large crockery establishment in Chicago, January 26, caused a loss of $350,000. . . . . Fire at Des Moines, Iowa, January 29, caused a loss of $500,000. . . . . Alaska has been experiencing the coldest weather recorded since white men have inhabited the country. At Dawson, January 16, the temperature was 68 degrees below zero; at Forty Mile, 78 below. The average for the seven days ending January 16 was 58 degrees below zero, and all the time a dense fog hung over the entire valley. . . . . Three persons were killed on a farm near Vancouver, B. C., January 22, by an explosion of 13 sticks of giant powder, which had been placed in the oven of a cook stove to dry.

CONGRESS.—Representative H. C. Smith, of Michigan, January 25, introduced a bill for a National freight commission, and to fix, adjust and regulate freight rates. Strong efforts are making to induce Speaker Henderson to fix an early date for consideration of the Brosius Pure Food bill. The Consular and Diplomatic Appropriation bill, carrying something over $1,700,000, was reported January 25 by the House Committee on Foreign Affairs. It provides $20,000 for purchasing land at Pekin for the United States Legation. . . . . The Senate, January 26, discussed for three hours the subject of National irrigation, the text being an amendment to the Indian Appropriation bill providing for surveys looking to the construction of an irrigation dam and ditch for the watering of the reservation of the Pima and Maricopa Indians, on the Gila River, Arizona. . . . . January 29, the President sent a message to Congress recommending the appropriation of $100,000 for the payment of the claim of Spain for Sibutu and Cagayan Islands, in the Philippine Archipelago, in accordance with the terms of the treaty recently ratified by the Senate.

FARM AND GARDEN.—The fifth annual meeting of the Eastern New York Horticultural Society will be held in the Berkeley Lyceum Building, 19-21 West 44th Street, New York, February 13-14. The programme includes, in addition to regular reports, papers by Prof. G. Harold Powell, of Delaware; Dr. W. H. Jordan, Geneva (N. Y.) Experiment Station; W. H. Blodget, Massachusetts; Prof. John Craig, Cornell University; W. H. Hart, New York; Prof. A. G. Gulley, Connecticut Agricultural College; Prof. F. W. Card, R. I. Experiment Station. The officers of the Society are: President, James Wood, Mt. Kisco; vice-president, W. F. Taber, Poughkeepsie; secretary-treasurer, Chas. H. Royce, Rhinecliff, N. Y.

The twenty-ninth annual convention of the Wisconsin Dairymen's Association will be held at Mondovi, Wis., February 13-15.

The highest price ever paid for a Hereford cow was realized at a sale at Kansas City, Mo., January 24, when $3,700 was paid for Carnation, from the Dale herd of Clem Graves, Bunker Hill, Ind. The purchaser was Jesses C. Adams, of Mowequa, Ill.

The farmers around Solomon City, Kan., have united to fight the grain dealers by forming a stock company to purchase an elevator. Ninety per cent of the farmers of this locality have taken stock in the company. It is claimed that the elevators of Solomon, all controlled by a grain dealers' combination, fix the price of grain far under the market price.

The Michigan Legislature has given a favorable report on a bill prohibiting the manufacture and sale of imitation butter, this bill, however, not applying to oleomargarine sold in such manner as to apprise the purchaser of its nature. There was also introduced a bill providing that cakes of oleomargarine and the wrappers containing them be distinctly labeled, and that the sale of oleomargarine in bulk be prohibited.

Dairymen in mass meeting at Elgin, Ill., January 25 decided to raise a fund to be used in lobbying in behalf of a law regarding inspection of cattle suspected to be infected with tuberculosis. They wish the present law changed to appraisement of cattle at full value at the time of examination, the owner to be given full pay if, on post-mortem examination, tuberculosis is not found, and 75 per cent if the disease is present; that no animal shall be condemned without the owner's consent in writing unless it shall be found diseased on examination; that no animal shall be slaughtered without the owner's consent in writing after the State appropriation for compensation is exhausted. The agitation will probably be carried to the present Legislature. The meeting was largely attended. Joseph Newman, president of the State Dairymen's Association, occupied the chair. Addresses were made by E. J. Fellows, H. B. Farmer, G. Vannorman, C. D. Bartlett, Judge D. B. Sherwood, J. A. Russell and others. A committee was appointed from each town in the district to solicit funds.

Agents of the New York State Department of Agriculture recently discovered that oleomargarine was coming into the State in violation of the law. They traced shipments to Tupper Lake, where the Cornell School of Forestry is maintained, and they assert that they have ascertained that Superintendent Collins, of the School of Forestry, had ordered the butter and had passed upon the bills for its payment and sent them along to Cornell, where they were audited and sent to the State Comptroller for final payment. This was done, they say, in spite of the fact that in 1893 a bill was passed to prevent the use of oleomargarine or butterine in any State institution. State Senator Ambler says that if the allegations are true he will introduce into the Legislature a bill to put the State School of Forestry under the jurisdiction of the State Department of Agriculture.

The Yakima (Wash.) Woolgrowers' Association has elected officers for the ensuing year as follows: John Cleman, president; S. J. Cameron, secretary and treasurer. They are instructed to draft a bill to present to the Legislature providing for the payment of the bounty of $1 each on coyote scalps. The Association has appointed a committee to meet with the Cattlemen's Association to arrange for the proper allotment of grazing lands on the Rainier forest reserve in case the Secretary of the Interior permits grazing there this season. The range was opened last year, July 1, to 250,000 sheep and 11,000 head of cattle.

At the annual meeting of the Rhode Island Horticultural Society the following officers were elected: President, J. E. C. Farnham; vice-presidents, R. H. I. Goddard, Royal C. Taft, Joseph D. Fitts; secretary and treasurer, Charles W. Smith; librarian, Christopher R. Browne; botanist, Prof. W. Whitman Bailey.

The Canadian government has passed an order in council that exemptions from the San José scale act are authorized for nursery stock to be entered only at St. John, N. B.; St. Johns, Quebec; Niagara Falls, Windsor and Winnipeg, between March 15 and May 15, and October 7 to December 7, and at Vancouver from October 13 to March 15. All shipments made except in accordance with the above will be entirely at the risk of owners or shippers, and the packages must be so addressed as to enter at one of the ports mentioned above. The route by which they will be shipped must also be clearly stated on each package. As it is well known that well-matured and thoroughly dormant nursery stock may be safely treated, but that there is danger of serious injury to the trees if fumigated in the Autumn before the buds are thoroughly dormant, or in the Spring after the buds have begun to unfold, all stock which when received is immature or too far advanced for safe treatment will be refused entry and held at the shipper's risk.

WESTERN N. Y. HORTICULTURAL SOCIETY.

PART II.

SPRAYING TREES IN BLOOM.—Prof. Beach's explanations seemed to settle a heretofore much discussed question in favor of the beekeeper. By a special law, the experiment stations have been allowed to make experiments in this line in four different localities. The observed results are about as follows: In every case where a blossom is fairly hit by the Bordeaux spray, it is killed, unless fruit has already set. As the blossoms are in different stages of advancement, some already set, some just opening, etc., the yield of fruit is not diminished by spraying a full-blooming tree in any one day. In seasons of scant bloom the practice would be dangerous, as it might kill a large percentage of the blossoms, and thus reduce the yield largely. A very diluted Bordeaux Mixture prohibits the germination of the pollen grains which it hits. It is true beyond doubt that insects are killed, or many carry the poison home to kill the brood in the hives, by feeding on the sprayed blossoms. Some points are yet to be covered by investigation. Among the hundreds of fruit-growers present, only one or two seemed still to insist on the advisability of spraying trees in bloom. The fool-killer, in short, has the best of the bee-killer.

APPLES IN COOKERY.—Miss Anna Barrows, at the close of her excellent paper, hit the nail fairly and squarely on the head when she expressed her regrets at the great loss of apples last Fall, as they might have been transformed into useful and salable articles, such as marmalades, jellies, apple butter, etc., right in the orchards. This, in her estimation, would be much more profitable than either to let the fruit go to waste or attempt to send it to distant factories.

ON PEACH GROWING.—J. H. Hale's address, as usual, was full of good points. He says we do not any more believe in peach "belts," having found that peaches can be grown almost anywhere in the United States, a few extreme northern sections excepted. Success depends mostly on the man or woman, and on closest attention to the business. The land should be on an elevation, the ideal soil being a light, medium sandy loam. Plow one or two crops of clover into the soil, and prepare it as you would for any garden crop. Then plant and give high cultivation. For a cover crop he recommends a mixture of cow peas and clover. The frost kills the cow peas, and gives the clover room and strength. He gives the trees free rations of potash and phosphoric acid, and just as little nitrogen as will produce good healthy foliage. He prefers large trees for planting, and trims them rather close, but not as close as Mr. Stringfellow does. The new growth is cut back severely every season, the first season perhaps not as much as afterwards. In strong-growing trees, his practice is to cut the strongest shoots out entirely, and to leave the weaker ones for fruiting. This point he considers the most valuable in his address. Thinning the fruit to about six inches apart is most important. Borers are to be dug out in October, and again in May. Banking the trees up with soil in Spring will keep the borer out at that time. The earth banking is removed in July. As to the size of package, the largest one that he can get into the private door unbroken is the one he wants. Girls are employed to do the sorting and packing, as most fitted to pack honestly. Mr. Hale is nothing if not original. He believes that "music has charms," and claims that by hiring a band to play for his crew in the afternoons, he has been able to get 30 per cent more work out of them. Mr. Hale was fairly pelted with questions, and replied with his usual quickness and wit. Thus he told how he frequently cuts the whole top out of an old tree to make a new head. Cultivation is done mostly by a modern extension harrow. He names Carman as one of the most promising peaches in America, but not rot-proof as claimed. It is of delicious quality, and the tree a fine grower. Elberta is good at the South, but of poor quality. Triumph, if well grown, well thinned and thoroughly ripe, is almost a freestone, and a good early peach for home use, but not for market, as it is quite subject to rot.

ON ORCHARD COVER CROPS.—Prof. John Craig favors a mixture of equal parts of Mammoth clover and Alfalfa for covering apple orchards. Alfalfa, sown August 1, has made a root 28 inches deep by the following Spring. The plant grows up without stooling. The Mammoth clover spreads and covers the ground. But no good stand of clover can be expected unless by thorough preparation of the seed bed. The roller should be used after seeding. Hairy vetch also makes an excellent cover crop. It requires about a bushel and a peck of seed per acre. Oats make no good cover crop, as it draws too much moisture out of the soil. So do all other cereals, and they are not nitrogen collectors. Mr. Hale recommends a thick sowing of turnip seed for poor soil. It makes a good and quick cover crop. Hairy vetch is hardy, and can be sown up to to September 1. Seedsmen will furnish the seed as soon as there is a demand for it.

SHORT AND SUGGESTIVE.—As the best method to fight the Shot-hole borer it is recommended to prune off the ends of the twigs where the eggs are deposited, and burn the trimmings. The Elberta peach was named as the best variety for October. Basic slag or "odorless phosphate" finds little favor with Dr. Jordan. Where soluble phosphoric acid is wanted, he would not use it at any price. Chickweed seemed to find as many friends as foes among the fruit growers present. It may be useful as a cover plant in rich and dense orchards. It is a shade-loving plant, and is bound to grow in rich orchards, where it will do little damage, and serve to keep the soil loose. Mr. Hale recommends white lead as the best possible cover for tree wounds.

SOFT DRINKS.—In his paper on Food Adulteration, Dr. Jordan warns against the so-called harmless or soft Summer drinks. The syrups taken with soda water are often colored with aniline dyes. There is enough of such coloring matter in one glass of soda to color a piece of woolen cloth six inches square a bright hue. It may well be doubted that these soft drinks are absolutely harmless.

ARSENIC COMPOUNDS.—Dr. L. L. Van Slyke mentions some of the adulterations of Paris-green and other arsenical compounds. He criticises the present Paris-green law of the State, as it does not forbid the adulteration of Paris-green with white arsenic, which is soluble, and liable to injure the foliage. The arsenoids are more bulky, and more easily kept in suspension than Paris-green. The insecticide known as Black Death consists largely of sulphate of lime with a little arsenic. Peroxide of silicate is 90 per cent sulphate of lime and 1½ per cent of arsenious oxide. Bug Death consists of the oxides of zinc, lead and iron, and has no fertilizing qualities as claimed.

FRUIT AT PAN-AMERICAN EXPOSITION.—Mr. S. D. Willard states that the Society as such will not make an exhibit of fruits. The space will be limited, and there will be no money prizes. But the State of New York has now in cold storage 300 barrels of choice fruits, and will make a finer exhibit than any other State. Wm. Scott, the well-known florist of Buffalo, and superintendent of the grounds, says that the horticultural building on the Pan-American grounds, erected at a cost of nearly $200,000, is far ahead in architectural beauty of that in Chicago in 1893, and a wonder of color display. There will be plenty of fruit on exhibit from the day the Exposition opens. Mr. Van Deman will have a wonderful display of tropical fruits. There will be millions and millions of flowers, and specimens of almost everything in trees and shrubs; 15 acres are to be devoted to the floricultural display outdoors.

Prof. Stuart suggests the removal and burning of affected raspberry canes, by pinching rather than cutting, after the fruiting season.

NOTES ON VARIETIES.—The following strawberry list was given: Bubach, Glen Mary, Brandywine, Sample, Marshall and Clyde. Mr. Hale would exclude Marshall, also Bubach, and perhaps Brandywine, the latter on account of its inclination to rust. His choice would be, Sample, Glen Mary, Haverland, Clyde, Pride of Cumberland, Nick Ohmer or Morgan's Favorite. The following apples were named among newer varieties of especial promise, viz.: Rome Beauty, McClellan (for family); Sutton Beauty, Ontario, the last named a cross between Northern Spy and Wagener, and very good. The Wagener apple can be grown to perfection by spraying. If well grown, growers can get an extra price for them. In peaches, Mr. Hale names Triumph as the earliest yellow peach, sure to overbear and needing thorough thinning. It rots so terribly as to be a curse to the market. Nurserymen should not sell a tree. Waddell is of the North China type; a very early, white-fleshed fruit, the best first early. Carman is white-fleshed, very large, delicious, hardy in fruit bud, but rots badly; otherwise the finest peach in America. Iron Mountain, or Ford's Late, is a large and most delicious very late peach. Ripens in Connecticut about October 10. Among most reliable and profitable crops the apple was generally conceded to stand in the front rank.

T. G.

Corn the Business Crop.

Shredded corn fodder or corn hay is not known in this market as an article of commerce, although we believe that there are a larger number of corn shredders in the hands of farmers than formerly, the machines, however, being simply used to prepare the fodder for home consumption. I believe, owing to the fact that corn can be raised successfully in almost all parts of this and neighboring States, that the farmer should devote a large part of his attention to its cultivation. The fact must not be overlooked, however, that the very reasons which make it desirable for home consumption are the ones which make it least desirable as an article for sale in the general market. The only possible chance of success that general farmers of the East have is to take advantage of their nearness to the market and produce milk, and to do this successfully they should keep on their farms a larger amount of stock than the farm itself would be naturally supposed to support, and, of course, this would mean that they would have to buy a certain amount of food products from outside. Now, if they work on this theory, it is plain that the products which they buy should be those that are most concentrated, as in that case they pay relatively the least amount of freight, and have the least amount of expense in handling, and if they do this it also follows naturally that they should produce on the farm such products as furnish relatively the most bulk, and there is nothing that will answer this purpose better than corn, especially if used as silage, but for this very reason if the farmer attempted to sell his corn fodder, he would be working under a very decided handicap. The writer has for a number of years past raised corn on every acre of ground which he cultivates, and notwithstanding the ground has produced corn each year the crops have steadily increased. Our plan, however, is to raise a green crop in between each year, as for instance on a large part of the ground we have Crimson clover planted early in July, and on other pieces we start the last of March with oats and peas, followed by sweet corn for Summer feeding, and on others we have sweet corn ending with barley and peas, and on others we have rye and wheat planted in the Fall and cut green in the Spring, and then followed again with corn. In other words, we aim to raise all the roughage that the farm will produce, and have stock enough to consume it, and buy the necessary concentrated foods outside.

PAUL T. NORTON.

New Jersey.

Woman and Home

From Day to Day.

I'm mighty fond o' Winter, when the frost is lyin' gray
On the gardens where we frolicked with the flowers o' the May;
When they have the candy-pullin's, an' the cider's sharp an' sweet,
An' the music o' the fiddle makes a fidget in yer feet!
Then you'll find me shore
On the creakin' cabin floor,
A-dancin' ev'ry quadrille an' a-coaxin' 'em fer more!

I've got a friendly feelin' fer the Spring, so rosy dressed,
With the wind in all her ringlets an' the blossoms on her breast;
When the mockin' birds air singin', an' you hear the honey bees,
An' the robins an' the rabbits air as happy as you please;
Then you'll find me shore
Jest a-th'owin' wide the door
To the sunshine an' the singin', an' a-whistlin' out fer more!

An' then I like the season when the Summer comes along,
An' the drowsy, dreamful weather like a sigh that's in a song;
When the cattle bells air clinkin' on the dusty hill an' plain,
An' the lillies air a-holdin' of their silver cups fer rain.
Then I takes my ease
In the shadders o' the trees,
While the partridge in the medder whistles lively fer a breeze!

An' I like the Fall time, bretherin'—when the leaves air gold an' gray;
When all's so still 'pears like the wind had sighed itself away
From the scented shadders o' the night, an' from the sleepy day—
When, if you'd only listen, you'd hear all the angels—Say
Then you'll find me shore
Jest a-th'owin' wide the door
An' lettin' heaven come down to me an' askin' 'em fer more!
—Frank L. Stanton in Collier's Weekly.

*

THE expedients of a flat dweller in some tiny city apartment would be regarded with consternation by many country housekeepers, accustomed to roomy houses. One woman told us that the deficiency in closet room caused her to keep most of her wardrobe in suit cases under her bed, while her rubbers and similar small articles reposed under her bureau. The homelier belongings of housekeeping were disguised in all sorts of unexpected ways, realizing this description of a suite in an apartment house, by a woman to whom it was a novelty.

"A suit," said Mrs. Herlihy, slowly, "is one o' thim places where the parloor is the bedroom, and the bedroom is the kitchen, and the closets is down in the cellar, and the bed is plannys—or organs, and—well, it's one o' thim places where iverything is something else," concluded Mrs. Herlihy.

*

WE read recently of a man who felt obliged to cook his own dinner, his wife and family being away, and as he was compelled to be at his place of business, some management was required. He was to have a boiled dinner, and would have it done to a turn, piping hot and ready to serve, at his home-coming. The meat, turnips and beets, therefore, which require a longer time, he put on before leaving the house. The potatoes and cabbage, needing less time for cooking, were put on the cover of the pot. Then he knotted a string through a hole in the edge of the cover, ran it through a loop suspended from the ceiling, and thence down to the sink. In the sink-hole he firmly stuck a candle, to which, two inches below the top, he tied the string. Last of all he lighted the candle and went to his business. In two hours, or about half an hour before he was to return, when it was time for the vegetables on the cover to go to their appointed place, the slowly descending flame burned the string, which released the otherwise unsupported edge of the cover, which dropped its burden into the pot and fell back where it belonged.

When the genius reached home, his dinner was ready.

*

THE meekest and most amiable of cows appears rather ferocious to one unaccustomed to cattle, suggesting unsuspected dangers, as this little anecdote from the Memphis Scimiter shows:

A little girl from Memphis, who has spent her life in the city, went out to visit her grandparents, living in the country, during the holidays, and, as usually happens in such cases, the little city lady displayed her ignorance. The little girl, soon after her arrival in the country, manifested great apprehension of being hooked by the cows about the place. One day her mother told her to go to a neighbor's home and

3695 Misses' Three-quarter Coat. 12, 14 and 16 years.

carry a message. The little girl started, but at the gate she encountered a cow, one of the mulley species.

In great excitement she ran back to her mother, crying: "Oh, mamma! there's a cow down there!"

The mother looked out of the window and saw the meek-looking bovine.

"Why, daughter, that's a mulley cow. She hasn't any horns and can't hook you."

"But, mamma!" exclaimed the child; "she hasn't any horns, but she might hook me with her pompadour!"

*

A NEW idea seen in the shops now is a set consisting of neck dressing and undersleeves to match, such as were worn by our grandmothers. They are made in lace, net, mousseline de soie and velvet, often with tinsel effects. From this one infers that the undersleeves are expected to remain in style for some time yet. Long scarfs of gauzy materials, going twice around the neck, with ends that fall almost to the knees, are to be a Spring fancy; many of them are edged with tiny quillings, and some with miniature flowers, little rosebuds or violets. A favorite stock, intended to go twice around the neck and then crossed in front, is made of five rows of half-inch ribbon, joined together as far as it encircles the neck, then left separate, so that there are 10 ribbon ends, each tipped with a gilt tag. The joins in the ribbon are often covered by gilt braid, or each alternate width is trimmed wth heavy insertion. Gold lace is very freely used in these stocks, and also gold spangles.

The Rural Patterns.

The three-quarter coat with box front and half fitted back is a favorite of the season for young girls, as well as for their elders, and means genuine warmth as well as style. The high, flaring collar fits snugly at the throat and widens to rest against the head. The revers are sharply pointed in Directoire style, and the back is shaped after the latest imported designs. As shown the material is beaver in a medium shade of castor, with collar and revers in velvet of a darker tone, trimming of bands and machine stitching, but all the shades of tan and castor are smart, and brown or blue can be substituted if preferred. The fronts are loose in box style and turn back to form the revers. The back is cut with side-backs and a center seam which curves gracefully to the figure. The side seams are open to the top of the stitching and so provide additional ease and freedom. The collar is cut in four portions high at the back and rounds off at the front. The sleeves are two-seamed and fit smoothly. Pockets, with laps, are inserted in each front and the coat is closed with handsome buttons and buttonholes in double-breasted fashion. To cut this coat for a miss of 14 years of age 2⅝ yards of material 54 inches wide will be required. The pattern No. 3695 is cut in sizes for misses of 12, 14 and 16 years of age, price 10 cents.

Russian styles continue in favor for small boys. The suit illustrated is of Russian green melton, with wide bands of braid overlaid by narrow strips of gold and is worn with a gold belt. The style is, however, equally adapted to cloth of different colors, to velvet, velveteen and corduroy; brown, blue, black, tan and red are all worn, and are held in equal favor with the green. Both fronts and back are seamless and fit smoothly across the shoulders, but are slightly loose below the belt to allow ample freedom for young legs. The left front laps well over the right in true Russian style, and the closing is effected invisibly beneath the trimmed edge. At the neck is a standing collar with rounded ends. The sleeves are laid in a wide box plait at the shoulders and tucks are stitched flat at the wrists to cuff depth. The trousers are fitted at the hips with small darts, are shaped with inside, outside and center seams, and closed at the sides. The lower edges are finished with hems or casings,

3721 Boys Russian Suit, 4 and 6 years.

in which elastic is inserted by means of which the leg portions are drawn in to give the baggy effect. To make this suit for a boy of 4 years of age 3⅞ yards of material 21 inches wide, 3⅛ yards 27 inches wide, 2 yards 44 inches wide, or 1¾ yard 50 inches wide, will be required. The pattern No. 3721 is cut in sizes for boys of 4 and 6 years of age; price 10 cents from this office.

Mrs. Fry's Rules of Living.

One of the most inspiring books we know is the life of Mrs. Elizabeth Fry, the English Quakeress who devoted herself to prison reform. Mrs. Fry laid down the following six rules of conduct, which, if obeyed, would revolutionize many lives:

1. Never lose any time. Time that is spent in amusement or recreation is not lost; there is a difference between play and idleness; but always be in the habit of being employed.
2. Never err the least in truth.
3. Never say anything ill of a person when you can say a good thing; not only speak charitably but feel so.
4. Never be irritable or unkind to anybody.
5. Never indulge yourself in any luxuries which are not necessary.
6. Do all things with consideration.

HONORABLE THOMAS B. REED

Has a most interesting article in this week's (Feb. 9) number of

THE SATURDAY EVENING POST
OF PHILADELPHIA

In which he treats of the declining influence of certain forms of public speaking, and its greater influence in other directions. Political, pulpit and after-dinner speaking are ably discussed.

The Saturday Evening Post is a splendid weekly magazine, handsomely printed and illustrated. Founded by Benjamin Franklin in 1728 and continuously published for 173 years; now has a circulation of 300,000 copies weekly, and ought to have a million.

Send 25c to try the POST for three months (13 weeks), and we will send you two valuable little books: "The Making of a Merchant" and "The Young Man and the World." The POST every week for three months and the two books—ALL for Only 25c.

The Curtis Publishing Company, Philadelphia, Pa.

LADIES do you ever get tired Washing Dishes? Our Dish-Drier will save you half the time and labor. Sent by express for $1. Your money back if dissatisfied. Send for circular. S. R. Divine & Son, Loch Sheldrake, N.Y.

LIFE AND REIGN OF QUEEN VICTORIA

Agents' profit from $10 to $25 per day; large fully illustrated book over 600 pages, only $1.75; big commissions; no capital required; freight paid; no experience necessary; we furnish the work and teach you free; great opportunity; act quick; send 10c. in stamps to help pay postage on agents' free sample. World Bible House, 1020 Race St., Philadelphia.

THE A B C of BEE CULTURE.

The only cyclopedia on bees. 466 pages and 406 illustrations. Every phase of the subject fully treated by experts. Price $1.20. Circulars and sample copy of our semi-monthly magazine, Gleanings in Bee Culture, free if you mention this paper.

Sold at all grocery stores—order it next time.

Housekeeping on a Business-like Basis.

The American Kitchen Magazine for January presented a valuable symposium on this subject, giving the views of a number of prominent men. Dr. Wiley, of the Department of Agriculture, whose name is familiar to readers of THE R. N.-Y., has this to say:

The first consideration to secure economical cooking is to have the best raw materials. Without this basis, successful cooking, either from the æsthetic, gustatory, or the economic point of view is impossible. The American people are entirely too careless in regard to the character of their foods. They buy according to habit, or the dictates of custom, or the claims of advertisers, without much reference to the excellence of the materials secured. There is very little difference between the cost of a really good article and a poor article of the same kind. The very best butter can be secured at a price very little above that of the ordinary; not meaning by "best" butter the fancy articles which command a high price more on account of their name and reputation than for their innate excellence.

The housekeeper is very apt to be imposed upon by the food adulterator. This is especially true with such substances as condiments. The spices and peppers of commerce often contain more flour than genuine condiments and sometimes they are wholly artificial. Oleomargarine is often disposed of as butter, although such a commercial transaction is illegal and exposes the persons engaging in it to heavy penalties both of fine and imprisonment. The market is full of self-raising flours which are mixtures only of ordinary flour with baking powders of different kinds. Table syrups and honeys are very frequently adulterated and the price of the genuine article is paid for glucose when honey is supposed to be purchased. A great many foods, especially of a condimental nature, contain preservatives, which, while in small quantities and taken at infrequent intervals may not be injurious to a healthy stomach, and yet often act in a very deleterious way upon the invalid or the child. While I am not personally opposed to the judicious use of preservatives, I think no food article should ever be sold containing a preservative, without bearing upon the label the character and amount of the preservative employed.

Even when foods are preserved by sterilization, they often develop poisonous properties when opened. This is especially true with meat, fish, etc. When such sterilized foods are opened, they should be at once consumed or in some way protected from contamination, since ptomaines are apt to be developed in such foods in poisonous quantities.

A Small Patriot's Idea.

There is a five-year-old boy on Massachusetts avenue who is of the blood of patriots. His grandfather was in both the Mexican and Civil wars and his father was also a Union soldier, consequently the little fellow has heard much "flag" talk in his short life and has exalted ideas of its "protective" qualities. He was the baby of the family till very recently, and occupied a crib bed in his mother's room. When the new baby came Harold was put to sleep in a room adjoining his mother's, and as he had never slept alone before his small soul was filled with nameless fears, which he was too proud to tell in full.

"It's mighty lonesome in here, mamma!" he called the first night after he had been tucked in his little white bed.

"Just remember the angels are near you and caring for you," replied mamma from the outer room.

"But, mamma," he objected, "I ain't acquainted with any angels and I'd be scared of them if they came rustling round, same as I would of any other stranger."

"Now, Harold, you must go to sleep quietly; nothing will hurt you."

"Can't I have the gas lighted in here?"

"No, mamma doesn't think it necessary, and it's not healthy."

There was silence for some time and then the small voice piped up again: "Oh, mamma!"

"Yes, dear."

"May I have grandpa's flag?"

"Why, what for? I want you to go right to sleep."

"Please, mamma!" and a small night-gowned figure appeared at the door. "Just let me stick the flag up at the head of my bed and then I'll go right to sleep. Indeed I will! You know the other night grandpa said at the meeting that 'under the protecting folds of the flag the weakest would be safe,' and I feel mighty weak, mamma."

He got the flag and when his mother looked in on him an hour later he was fast asleep, with a little fat fist under his red cheek, holding fast the end of the "protecting" flag.—Washington Evening Star.

A Salmagundi Party.

A writer in the Modern Priscilla thus describes a salmagundi party:

Cards fancifully inscribed with the word "Salmagundi," and each having a programme pencil tied to a corner with baby ribbon, were furnished to the guests. As the word itself created immediate interest, our hostess came to the rescue and explained that Salmagundi was originally a dish of mixed ingredients, named after its inventor, Lady Salmagondi, now applied to a miscellany of any description. The evening was to be composed of miscellanies, tests both of memory and the senses. A covered basket containing a butter plate, china egg, pencil, spool, and similar small articles to the number of twelve, had been previously prepared by the hostess. The lid of the basket was attached to the back. Beginning at the front of the lid two four-inch strips of cloth were fulled along each side of the back, the lower edges of the strips being fastened to the upper edge of the basket. When the lid was raised as far as the width of the strips would permit, a narrow slit was left for the hand. Each guest was timed one minute to feel the objects, then withdrew to write as many as could be remembered.

A box containing four bowls of finely graded shot was covered with a cloth fulled on to the back of the box, brought over the top, fastened securely on each side edge and caught in the middle of the front edge, thus leaving entrance for both hands, while concealing the contents effectually from view. Large numbers were sewed on this cloth over each bowl. The guests were to determine by touch the sizes of the shot, and place them in order of their size on the cards furnished. For instance, the largest size might be three, the next size one, the next size two, and the smallest size four.

While these tests were in progress, the rest of the company were engaged in feeling ten bundles to decide their contents. Metal objects had been loosely sewn in lawn before being wrapped in paper, to prevent any portion protruding from the package. Ordinary objects could easily be detected almost without touch. Care had been exercised in the selection. The objects used for this evening's entertainment were a small china doll, turnip, Dover egg beater, feather, bell, clothespin, buttonhook, shell, horn spoon, and cooky cutter. As a last test a card having ten pictures of objects, dog, horse, strawberry, and so forth, was passed to each guest for the space of a minute. All wrote from memory the result of their observation. When each member of the company had had an opportunity to try the different tests, the hostess read aloud the correct lists and awarded favors to the two who had been most successful. All were then requested to stand in a circle. A dozen small articles were thrown on the floor in the center, viz., a key, match, button, pencil. Each was urged to notice the articles, and at a given signal close his eyes while one was withdrawn. The one guessing the missing object first was allowed the privilege of being the next to draw something out. All articles were returned to the center before each withdrawal. This game was kept up briskly for a few moments, and before the interest abated refreshments appeared.

Rural Recipes.

Twin-Mountain Muffins.—Cream one-third of a cupful of butter; add gradually one-fourth of a cupful of sugar and one-fourth of a teaspoonful of salt; add one egg beaten light, three-fourths of a cupful of milk, two cupfuls of sifted flour and four level teaspoonfuls of baking powder. Bake in hot buttered gem pans about 25 minutes.

Soft Gingerbread.—Four tablespoonfuls of brown sugar, nine tablespoonfuls melted lard, one tablespoonful of ginger, one teaspoonful of salt, one cup common molasses, one cup boiling water in which is dissolved one teaspoonful of soda. Add flour enough to make a thin batter. Always stop adding flour when the batter seems a little too thin. Bake in slow oven.

Steamed Cranberry Dumplings.—Make the dumplings of good, prepared flour, which cannot fail to be light, using one pint of it; add a pinch of salt and mix with milk to a paste just stiff enough to drop by tablespoonfuls on the buttered steamer bottom; steam over boiling water about half an hour. Serve immediately; first carefully split the fluffy rolls open, lightly butter and put between a tablespoonful of stewed cranberry sauce (warm); pour over a foamy sauce made as follows: Three tablespoonfuls of milk, stirred into one beaten egg, a half-cupful of sugar and one teaspoonful of flour; beat hard and put into double boiler; pour on slowly a cup of boiling water, stir constantly until the sauce thickens, then add one teaspoonful of butter and one of strawberry flavoring.

MOTHERS.—Be sure to use "Mrs. Winslow's Soothing Syrup" for your children while Teething. It is the Best.—Adv.

[We recommend above Company as thoroughly reliable.]—EDITOR.

MARKETS.

REVIEW AND OUTLOOK.

POTATOES.—There is a heavy stock on hand, and the market is very weak for anything but the best. Trade in Bermudas is light.

EGGS are advancing again. Though the receipts are large, there is no surplus, as speculators and the local trade are absorbing them about as rapidly as they come in. The supply of refrigerators offered is light.

HOTHOUSE PRODUCTS.—Mushrooms remain very dull. There is some asparagus from the West, which sells at high prices, some as much as $6 per dozen bunches. Choice lettuce is scarce. There is a fair inquiry for tomatoes and cucumbers of prime quality.

GRAIN.—Wheat has declined since last report. Advices from the northwestern provinces of India indicate an increase of 20 per cent in area and favorable conditions for seeding. There is some export demand for rye. Oats are steady with some speculative interest in western markets.

BUSINESS BITS.

THE manufacturer guarantees the Lightning seed sower to sow broadcast 60 acres a day of clover or other small seeds. Write to W. J. Buss, 53 Day St., Golden, Ill., for full information.

GEORGE P. HAMMOND & CO., 34-36 Little 12th st., New York, will handle on commission your dairy goods, eggs, poultry, fruits or hothouse products. Drop them a line, stating what you have for sale.

"THE Light that Never Fails" is the claim made for the Angle lamp. These lamps are inexpensive, burn oil, and give a light equal to gas or electricity. A catalogue which explains all will be sent free to any reader of THE R. N.-Y.. Ask for Catalogue N. U. Address Angle Lamp Co., 76 Park Place, New York.

A GUN is quite a necessity on any well-regulated farm. A good gun is the only kind that is worth having, or safe to use. This does not necessarily mean a high-priced one. The name "Winchester" is standard everywhere, with sportsmen. A postal card will bring you a 164-page illustrated catalogue telling all about guns and ammunition. Address Winchester Repeating Arms Co., New Haven, Conn.

A RECENT note in the Melbourne (Australia) Leader describes a new ice-making and meat-packing establishment, the most modern in South Australia. The description says that special care has been used in the erection of the building, P & B Ruberoid being used throughout. The value of this material seems widely recognized; it is of especial value in farm buildings. Write concerning it to the Standard Paint Co., 85-87 John St., New York.

EVERY farmer should apply to the nearest McCormick agent for a copy of the most beautiful and artistic calendar ever issued free by any harvesting machine house, and obtain at the same time a catalogue of the machines manufactured by this company for 1901. Both the calendar and the catalogue are magnificent specimens, and demonstrate that the McCormick Company, after 70 years of success, continue to supply the agriculturist with the finest and most modern machines in the world.

DR. SLOAN'S Liniment will reduce a swollen tendon in a marvelously short time, and the way it will kill a spavin curb or splint is remarkable. Dr. Sloan has published a most interesting book entitled "A Treatise on the Horse." This book will be found valuable to anyone owning horses. It gives much information about the diseases of horses and advice as to treatment. Dr. Sloan's Liniment is a universal remedy for man and beast. The book is free for the asking. Write to Dr. Earl S. Sloan, Boston, Mass.

THE 1901 "Planet Jr." catalogue is now ready for mailing. This new catalogue is superior in every way to anything this well-known firm has ever put out. It is instructive from beginning to end, and it contains illustrations and descriptions of the entire "Planet Jr." line of garden and farm tools, and is thoroughly interspersed with handsome pictures. There are 28 half-page and two full-page pictures, reëngraved from actual photographs, illustrating the use of "Planet Jr." goods in this and foreign countries. If our readers would like a copy, S. L. Allen & Co., Box 1107 V Philadelphia, Pa., will take pleasure in mailing one free; write and ask them for it.

WHEN you write advertisers mention THE R. N.-Y. and you will get a quick reply and "a square deal." See our guarantee 8th page.

Send for our FREE 328-Page Agricultural Catalogue,
Marvin Smith Co., 55-57-59 Jefferson St., Chicago, Ills.

Publisher's Desk.

Never before in the memory of the present management were so many farmers writing for sample copies of THE R. N.-Y., and sending their subscriptions direct one by one. This is, of course, gratifying, and we give a large measure of credit for it to those old friends who keep reminding their neighbors of the value of the paper, and for passing on to them samples and conveniences for sending orders and remittances. As an encouragement to old friends to put the paper into new homes, for a club of four names with $4, we will send the club-raiser's subscription for one year—the five names for $4.

For one new name with $1 we will send you any one of these books:

Celery Growing and Marketing $1.00
Landscape Gardening, Long..... .50

For a club of four with $4 any of these books:

Horses, Cattle, Sheep and Swine, Curtis.$2.00
First Lessons in Agriculture, Gully.... 1.00
Practical Farm Chemistry, Greiner..... 1.00
The Spraying of Crops, Lodeman..... 1.00
The Nursery Book, Bailey..... 1.00
Fertility of the Land, Roberts..... 1.25

The books are sent post-paid. They are cloth bound, and the best and latest books on these subjects. This is an opportunity for young men or old to get books.

For other inducements for clubs see the premium articles on other page. Those who would like to raise a club on cash rewards should write us at once for samples, and cash terms to club-raisers.

If you want any other papers, see our club list, and write for prices on any paper you do not find there.

Strawberry Culturist is no longer published. Eastern Shore Farmer and Fruit Culturist is being sent subscribers in place of it.

THE RURAL NEW-YORKER.

Market Briefs.

PICKED UP HERE AND THERE.

FISH FIGURES.—As the result of 275 trips, fishing vessels brought into the port of Boston during December, 1,500,000 pounds of cod; 22,700 of herring; 1,032,000 of hake, and 1,600,000 of haddock. Smaller catches of other varieties brought up the total to 4,600,000 pounds, worth $115,000.

COTTON NOTES.—There were lively scenes on the Cotton Exchange in this city the last few days of January, on account of one of the biggest "corners" that the market has seen for over 20 years. The price for January delivery jumped at one time to 12¾ cents, and current prices for Middling Uplands and Middling Gulf are now 12 and 12¼ cents, respectively. Such figures are out of proportion to the price and demand for manufactured goods, and there will have to be some drop before spinners take hold to any extent. Reports from southern Texas are that plowing has commenced, and that the acreage will be larger than usual. Receipts at cotton ports for the week ending January 30 were 210,000 bales, an excess of 30,000 bales over the previous week.

MILK PRICES.—That benevolent organization, the New York Consolidated Milk Exchange, at its last monthly meeting, decided that it was paying one-fourth cent per quart too much, and voted to reduce the price to 2¾ cents. A consumer here who pays eight cents per quart for milk that will just barely pass the legal test, would like to know who gets the 5¼ cents difference between what he pays and what the farmer gets. It does not seem to him that it ought to cost twice as much to bring milk here and distribute it, as it does to produce and deliver it to the railroad station. He does not mind having all who handle what he buys get a living profit, but thinks that some one in the milk business is getting more than his share.

SELLING SAWDUST or chips from planing mills is quite a business here. Peddlers cart it around in wagons, and charge 25 cents for a bag holding about three bushels. It is used in butcher shops, saloons, restaurants and small stores where there is considerable running in and out, particularly in the down-town parts of the city, where the streets get muddy on a wet day. The sawdust sprinkled on the floor absorbs the sticky mud which is tracked in, and it is easily swept out and replenished three or four times a day if necessary. Also a good many people keep a stock of sawdust on hand for use in sweeping the house. When well moistened and sprinkled on carpets, the dust, which ordinarily would fill the air and settle on the walls and furniture, is kept where it belongs, on the floor, and swept out.

WOOL.—Sales in Boston for the last week of January are reported at 3,400,000 pounds, and the sales for the entire month, 9,600,000 pounds, a decrease in business of over 7,000,000 pounds for the same period last year. Prices on New York, Michigan and Wisconsin X and XX are 22 to 24 cents, and fine delaine, 26 to 28.

GOODS MISSING.—For some time importers have been complaining that articles were taken from their cases of goods while at the United States Public Stores in this city, for inspection by the custom house officials. The charges became so serious that new rules have been adopted, so that all employees who open cases and handle goods will be watched carefully. This close inspection would not be necessary but for the dishonesty of importers who try to bring in small dutiable articles free by putting them in the middle or a corner of a case of other goods, or by invoicing goods at less than their real value. This makes it necessary to have at the public stores experts who know the actual value of all sorts of imported goods, and in cases where anything wrong is suspected, all packages are emptied out, and the most careful examination made.

W. W. H.

NEW YORK POULTRY SHOW.

The twelfth annual exhibition of the New York Poultry, Pigeon and Pet Stock Association, was held at Madison Square Garden in this city during the week ending January 26. An improvement over previous shows was noted in the manner in which the exhibits were arranged. Formerly the incubators and brooders were shown in a room outside the main hall. This year the anteroom was used for song birds and pet stock. The incubators were in the auditorium, and as the young chicks kicked out of their shells, they must have felt quite at home in the atmosphere of crow and cackle around them. One feature of the show of general interest is the chorus of crows, the musical efforts of something less than 500 roosters, which salutes one as he enters the building. The astonishing thing is the volume of sound they make, which drowns out the harsh voices and makes the whole result quite melodious. The attendance was fair. There are always a lot of regulars who go to every show that comes along just out of curiosity, not that they know or care anything particular about horses, poultry, dogs or cats. Then, of course, the fanciers are there in full force to show their stock and make sales to regular or amateur poultrymen who are on hand looking for breeding stock or information. So far as numbers go, the Plymouth Rocks and Wyandottes appeared to be in the lead. Then came Leghorns, Langshans, Brahmas and Minorcas. Of course, all the standard breeds were represented, though some by only one or two birds. The show of Game fowls was large, and there were some strange-looking specimens of these long-legged savage fellows. One, a rusty red-and-white, had his recommendation tacked up in the cage to the effect that he did not confine his pugilistic efforts to his own tribe, but had thoroughly whipped a fox terrier, which had tried to interfere with him. The display of turkeys and water fowls was large, and there were some enormous Bronze gobblers, Pekin ducks and Toulouse geese; also a few white and a dozen Buff turkeys, and several wild turkeys. An odd-looking duck is the Indian Runner. It is medium-sized, brown and lively, as the name indicates. The pigeon exhibit numbered nearly 3,000 birds, and no one but a fancier would imagine that there were so many varieties. The New York Herald exhibited a cage of Homing pigeons with records of long journeys by land and sea. Among the oddities were specimens of curious fowls found in various parts of Asia. One of the most striking was the Manchurian Crossoptilon, from North China. His head is black, with the exception of a little red around the eyes, and two long white feathers starting under his throat curve upwards and stand over the top of his head like horns. His head resembles pictures of the evil one as artists usually represent him. Other novelties were black ducks, black swans, and the great Crown pigeon, a genuine dude, from Java. In pet stock there was a fine show of Belgian hares, rabbits and cavies, one of the latter being valued at $50. The display of cats was smaller than usual. A yellow and white short-haired one by the name of Ginger, appeared anything but gingery in disposition, as he rubbed against the side of the cage and tried to make friends with all who came along. The song birds in the anteroom attracted considerable attention, and the performances of some of the Belgian canaries, which had had special training, were remarkable. This show is worthy of a larger attendance on the part of out-of-town people within reasonable distance of New York. Anyone at all interested in the poultry business will find a day or two spent here each year time well invested.

W. W. H.

The Golf Girl

Is the type of the modern woman at her healthiest and best. She walks with an easy grace. She is a picture of perfect womanhood in the springtime of life. But generally the golf club is laid aside with marriage. A physical languor oppresses the once athletic girl. Exercise makes her back ache. She tires easily. Usually she accepts this condition as a natural thing, but it is unnatural. Marriage should add to woman's happiness, rather than subtract from it. If women understood how intimately the general health is related to the local health of the womanly organs, they would appreciate the fact that there is no need to suffer from weakness and backache. The use of Doctor Pierce's Favorite Prescription makes weak women strong, sick women well. It regulates the periods, heals inflammation and ulceration, cures female weakness, and puts the body in a condition of sound health.

Mrs. H. A. Alsbrook, of Austin, Lonoke Co., Ark., writes: "After five months of great suffering with female weakness I write for the benefit of other sufferers from the same affliction. I doctored with our family physician without any good results, so my husband urged me to try Dr. Pierce's medicines—which I did, with wonderful results. I am completely cured. I took four bottles of Dr. Pierce's Favorite Prescription, four of his 'Golden Medical Discovery' and two vials of his 'Pleasant Pellets.'"

Dr. Pierce's Pleasant Pellets cure constipation and its consequences.

Older Machinery.—Send for catalogue to Boomer & Boschert Press Co., 118 West Water St., Syracuse, N.Y

AMERICAN FIELD AND HOG FENCE
FULLY GUARANTEED.
Best steel wires heavily galvanized. Strong, economical, efficient, durable. Local agents everywhere. If no agent in your town write to the makers.
American Steel & Wire Co., Chicago or New York.

A RARE COMBINATION

HARTMAN STEEL ROD PICKET FENCE.
Best and handsomest for lawns, parks, cemeteries, school grounds—anything. Send for our free catalogue—know more about it.
HARTMAN M'F'G. CO., BOX 19 ELLWOOD CITY, PA.
Or Room 70, 309 Broadway, New York City.

BULL-STRONG!
....PIG-TIGHT....
An Illinois farmer said that after harvest he had fully 200 bushels of loose oats on the ground that he could not secure any benefit from, because the fence around the field would not turn hogs. Figure the loss for yourself, he also said, all this would have been saved if he had used the Kitselman Woven Wire **Coiled Spring Fence**, and the value would have gone a long ways towards paying cost of the fence.
With the **Duplex Machine** any farmer can make it himself at the actual cost of the wire. Catalogue free for the asking.
KITSELMAN BROS.
Box D92. Muncie, Ind.

Quick Fertilizer

There is nothing in the American market today that acts so quickly and surely as a fertilizer as

Nitrate of Soda.

Apply to the surface in the spring. A small quantity does the work. Watch the crops closely and when they look sick or make slow growth apply the remedy promptly. Book, *"Food for Plants,"* tells all about it. **John A. Myers,** 12 O John St., New York, will send you free copy on request. *Nitrate for sale by fertilizer dealers everywhere.*

Write at once for List of Dealers.

SAW YOUR WOOD

With a FOLDING SAWING MACHINE. 9 CORDS by ONE MAN in 10 hours. Send for FREE illus. catalogue showing latest improvements and testimonials from thousands. First order secures agency.
Folding Sawing Mach. Co. 55 N. Jefferson St. Chicago, Ill.

LAND DRAIN TILE
(Car-loads or less).
Sizes, 2, 2½, 3-inch and up to 15-inch.
WILLIAM T. LEGGETT & CO.

We never heard of a farmer using Hallock's "Success" Weeder on wheat who did not get a bigger crop than his neighbor with equally good land but without the Weeder. The extra bushels of wheat would pay for many Weeders. You can cultivate 35 to 40 acres a day with the "Success" Weeder. The question is *can you afford to do without it any longer?*

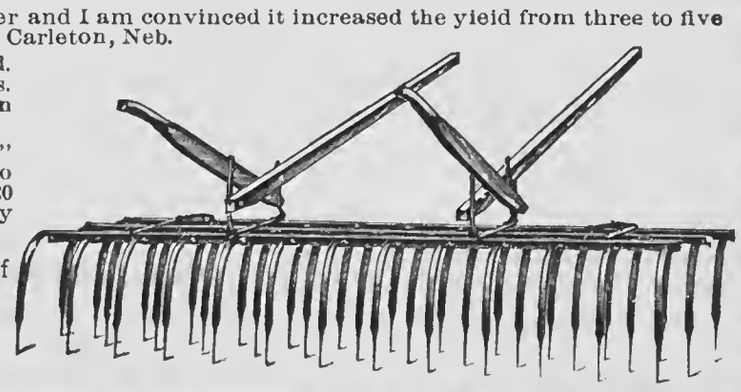
Hallock's "SUCCESS"
ANTI-CLOG WEEDER AND CULTIVATOR

is the most useful and profitable all-round implement for use on the farm. See what some wheat growers say:

"I went over 40 acres of wheat with your "Success" Weeder and I am convinced it increased the yield from three to five bushels per acre." L. H. WATERMAN, Carleton, Neb.

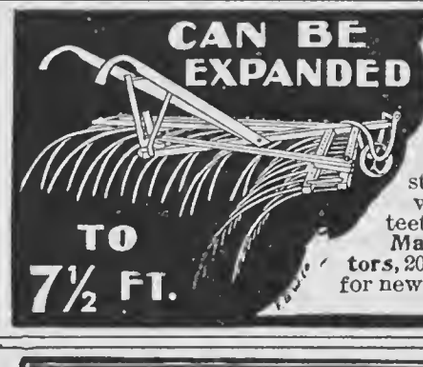
"I have put the Weeder on winter wheat to cover grass seed. It did finely. I tried it on oats; it covered both oats and seeds. I am well pleased with it, and so is everybody who has seen it." E. T. HAMPTON, West Allen, N.Y.

"I gave 40 acres of wheat four cultivatings with "Success" Weeder. This 40 acres threshed out 800 bushels, 20 bushels to the acre. I used it on 120 acres, going over it once. This 120 acres threshed out 1560 bushels. My neighbors averaged only 4 to 10 bushels per acre." E. A. CHUBB, Langford, S. Dak.

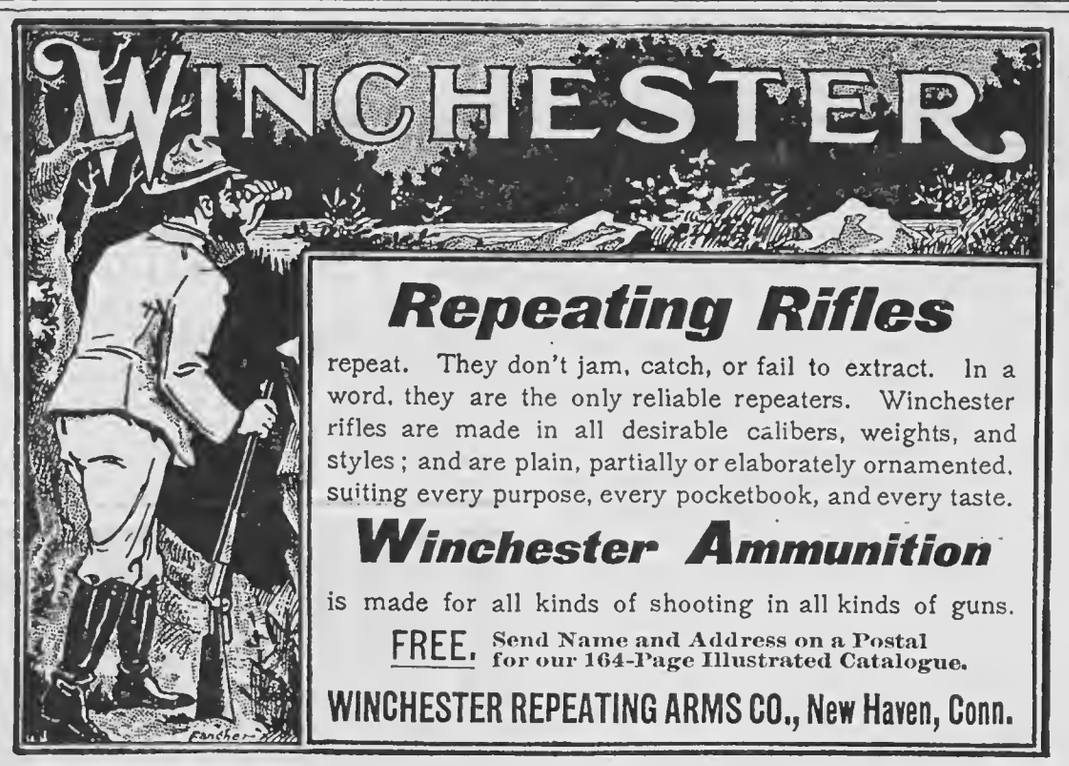


Write for terms, description, evidence of hundreds of farmers and special introductory offer.

HALLOCK WEEDER AND CULTIVATOR CO., Box 805 York, Pa.
(Please mention box number.)



THE KEYSTONE
Adjustable Weeder and Shallow Cultivator
because of its "A" shape, adjustment and ground wheel excels all others. Shape enables it to fit all rough and uneven surfaces. Wheel makes it run steady—prevents all vibration and "wobble." Adjusts to 7½ feet wide for cultivating entire surface. Narrows to 30 inches for cultivating "middles." Round teeth, blunt points for light soil. Flat teeth, diamond points for heavy soils. We Mail Weeder Booklet Free. Also make 10 styles of Corn Planters, 12 styles Cultivators, 20 styles hand and power Corn Shellers, Harrows, Rollers, Feed Cutters, etc. Write for new Catalogue C
KEYSTONE FARM MACHINE CO., 1547 N. Beaver St., York, Pa.



Repeating Rifles
repeat. They don't jam, catch, or fail to extract. In a word, they are the only reliable repeaters. Winchester rifles are made in all desirable calibers, weights, and styles; and are plain, partially or elaborately ornamented, suiting every purpose, every pocketbook, and every taste.
Winchester Ammunition
is made for all kinds of shooting in all kinds of guns.

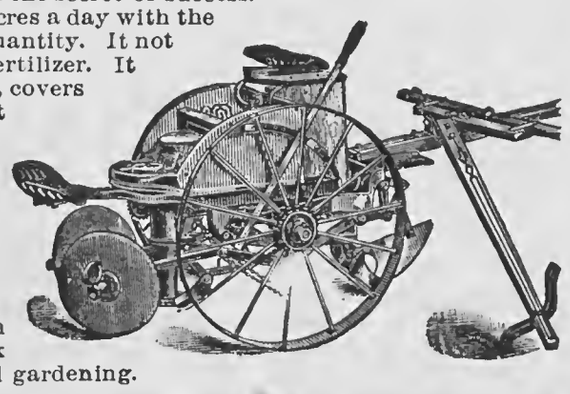
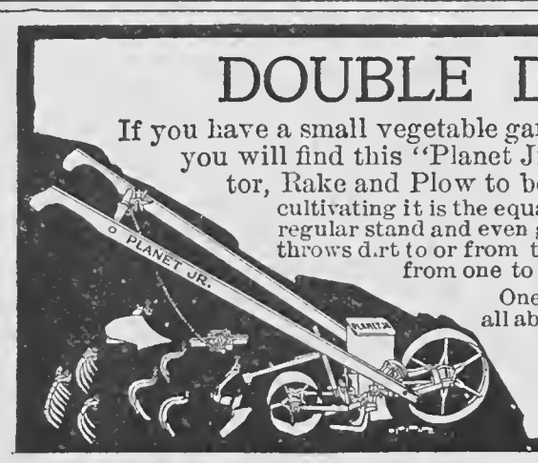
Profit from the Potato Crop

Promptness in planting potatoes when weather and soil are just right is often the secret of success. You can take advantage of favorable weather and plant from four to seven acres a day with the IMPROVED-ROBBINS POTATO PLANTER. Its work is quality as well as quantity. It not only plants quicker than by hand but better. It is economical of seed and fertilizer. It plants in every hill, makes no misses and no doubles. It spaces accurately, covers uniformly and the fertilizer is mixed with the soil near the seed but does not come in contact with it.



The IMPROVED-ROBBINS
POTATO PLANTER
is made by the Iron Age people at the works where the famous Iron Age farm and garden implements are made. Write for a copy of the Iron Age Book for 1901, describing all these implements. It is a guide to better farming and gardening.
BATEMAN MFG. CO., Box 102, Grenloch, N. J.

DOUBLE DUTY GARDEN TOOLS.
If you have a small vegetable garden, and enjoy working it yourself, or if you [illegible] work done you will find this "Planet Jr." No. 4 Combined Hill and Drill Seeder, and [illegible] Hoe Cultivator, Rake and Plow to be almost indispensible. In sowing it equals [illegible] best seeders; in cultivating it is the equal of our best wheel hoes. Drills or drops all garden [illegible] regularly producing regular stand and even growth. Cultivates all vegetables between the ro[illegible] each side of the row, throws dirt to or from the row, hills up, marks out, plows, rakes, levels, etc. Instantly changed from one to the other. This tool cannot be over recommended.



One of our 350,000 catalogs for 1901 should be in every landowner's hands. Tells all about our "Planet Jr." line of Seed Drills, Wheel Hoes, Horse Hoes, Cultivators, Two-Horse Cultivators, Sugar Beet Seeders and Cultivators, and our reduced prices for 1901. Shows photographic pictures of their uses at home and abroad. Sent free on request.

NEW YORK CITY FARMS AND FARMERS.

SQUATTERS ON MANHATTAN ISLAND.

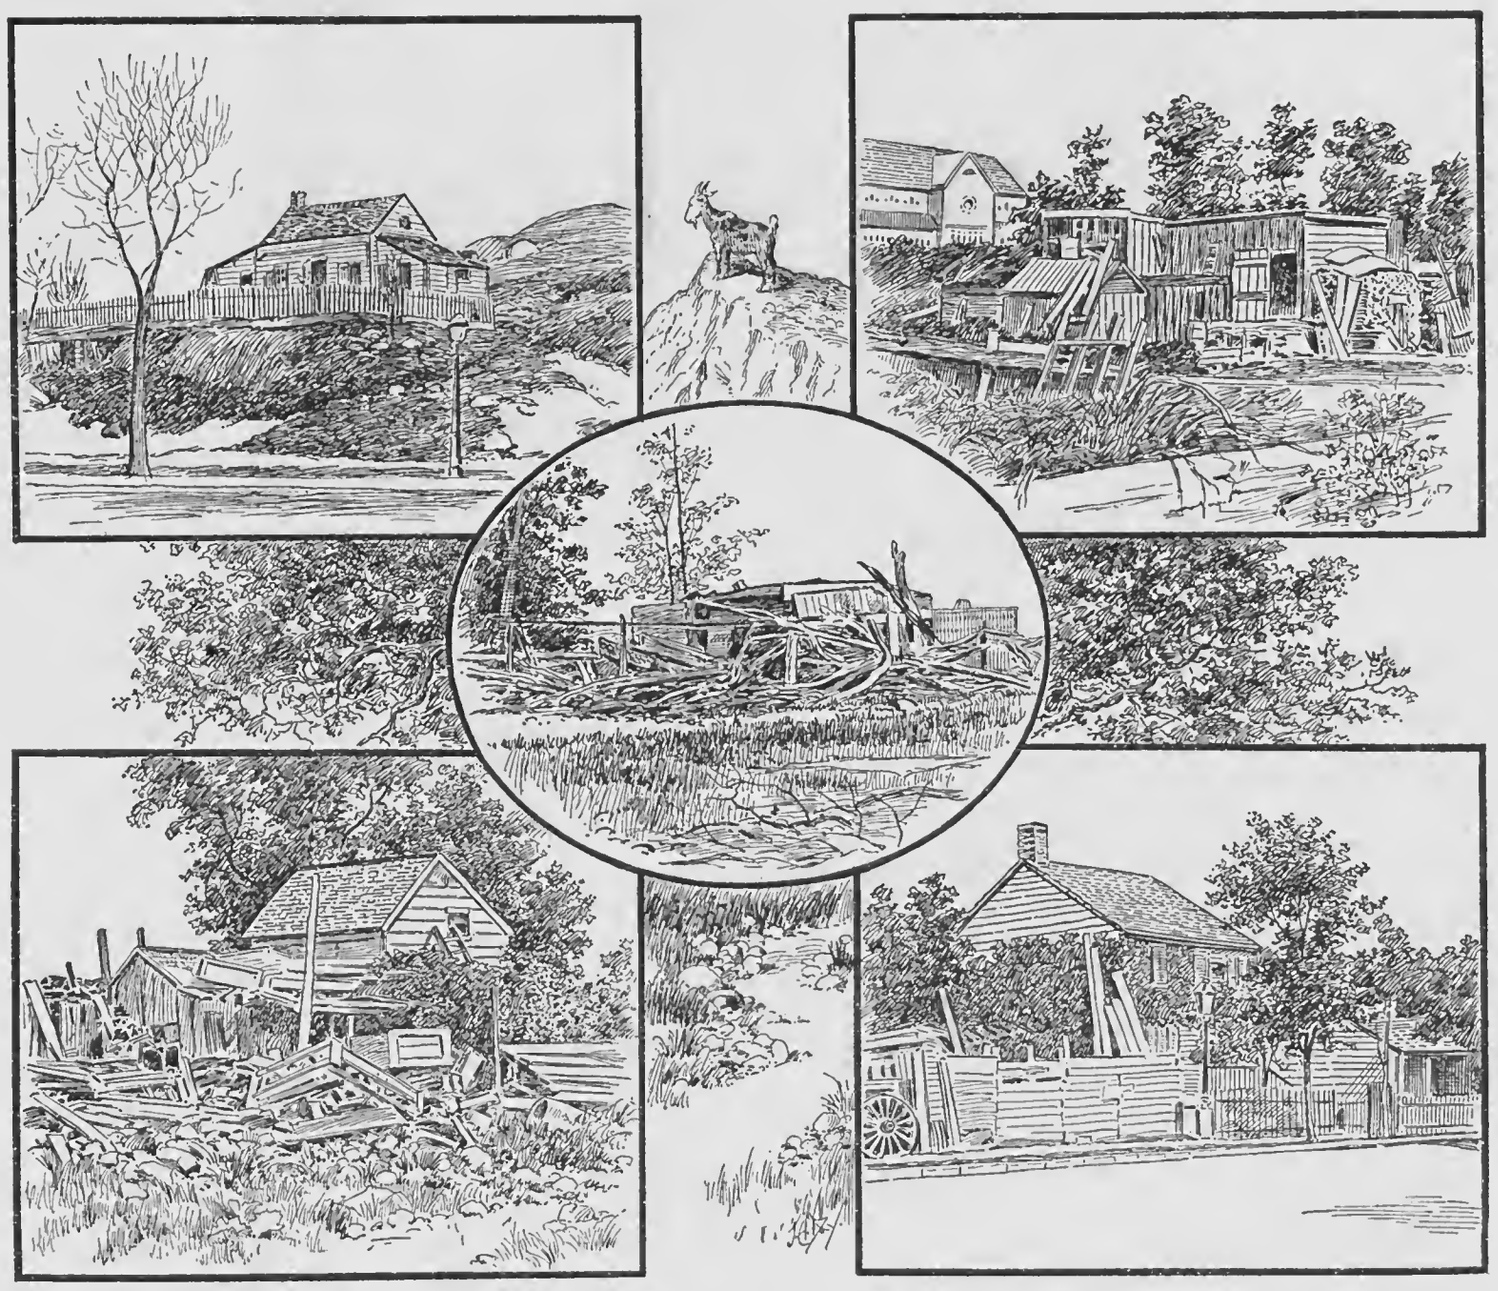
The Land of the Goat.

OLD NEW YORK.—There are people now living who can remember when New York was comparatively a small town, with cows pasturing below Canal Street. There was good hunting in the vicinity of Central Park, and one real estate man who bought land for building lots near where Fifty-third Street now is, was considered as taking a short cut to the lunatic asylum. His partner grumbled at such foolishness, stating that the town could not by any possibility grow so far out into the wilderness as that. Gold Street is said to follow an old cow path, and anyone who walks its whole crooked length will not doubt the statement. A man who owned a small farm in the vicinity of Park Row, where land is now so expensive that the aim in building is to take but little space for foundation, and as much sky room as possible, traded it for land on Long Island, that was less rocky and better adapted to farming. His grandchildren are still raising vegetables on the Long Island farm, and thinking hard things because of their grandfather's lack of foresight in disposing of what proved to be most valuable property.

SURFACE CHANGES.—Manhattan Island was originally hilly, swampy, rough and rocky. As the city grew, the hills were scraped into the low ground, and, with the exception of a strip along the upper west side, the Island is comparatively level now. Where new streets are laid out, an effort is made to avoid all sharp pitches, and make the grade from one point to a higher one as nearly uniform as possible. Because of this, people who live on old roads toward which the city has been gradually growing, find themselves in awkward positions, some on high ground, being left on the top of a pinnacle, from which it is necessary to have a series of steps to get to the street, and others whose houses are on low ground are shut out from the rest of the world because the streets on all sides have been filled in, in some instances so high as to be on a level with the chimney tops. These results are ridiculous to look at, if rather embarrassing to the owner. In any case he has no remedy except to rebuild, either filling in or lowering the foundation as the case requires.

A SQUATTER is a person who, finding a piece of land unoccupied, takes possession of it, either with the consent of the owner, or because of his indifference. Vacant lots on the edges of a city are not of much account to the owner until used for building purposes, and there is no loss to him in having some one put up a little shanty and live there temporarily. Some of the problems of the owners of lots in growing cities are to know when to sell or what to build, and some of this land is held for years, being taken by children as playgrounds, or occupied by squatters, while the owner is waiting to see from the way that the city is growing, what is the limit of price he may expect to get, or what sort of buildings may most profitably be put up on the land. The squatter style of living in many particulars is like that of the patriarchs. It might be considered romantic by some, but the sharp edges of the romance must be considerably ground off when a contractor comes along with his gang of men, tears down the shanty, and starts to blast the rocks and dig for a foundation.

SHANTIES.—The illustration on this page shows a variety of tumble-down buildings. Probably 40 or 50 similar shanties could be found on the upper west side of Manhattan Island, above 110th Street. A large part of this strip of high ground overlooking the Hudson River is owned by educational institutions, asylums, hospitals, and homes for unfortunates of various kinds. Within sight of Columbia College, St. Luke's Hospital, and the Sacred Heart Convent, are many of these shanties, making a striking contrast. Part of them are on land owned by the institutions, the authorities of which allow the squatters to remain pending the extension of the buildings or the sale of the lots. Some of these shanties have been very small on the start, and increased by additions until they cover as much ground as a fair-sized house. One of these is shown in the upper right-hand corner of the picture. In the background to the left is a large church. The outside of the shanty is a crazy patchwork of old boards, tin, tarred paper, etc., and half a dozen or more people live there. The picture in the center shows a most dilapidated state of affairs, and one would hardly expect to find it inhabited except by rats, mice and bugs, yet an old man keeps house in this primitive fashion, and lives quite comfortably with his two dogs. I have talked with him at times. He takes things philosophically, and seems to be thankful for even such a humble place that he may call home, something of a lesson to discontented brownstone-front dwellers. These squatters represent a variety of classes, some the roughest kind of tramps and do-nothings, begging or stealing their living, and loafing around out of doors in the warm weather; and others with regular employment, who prefer freedom from the responsibilities of renters and landowners, with the uncertainties of life of this kind, to the certainty of paying rent. None of them is a desirable citizen, and such a shiftless mode of living should not be encouraged.



SOME FARMHOUSES AND FARM SCENES ON MANHATTAN ISLAND. FIG. 37.

ANIMALS IN THE FAMILY.—Most of these people have one or more dogs, and often a few goats. The dog easily adjusts himself to all kinds of circumstances. He likes a square meal as well as anyone, and his ability to consume food resembles that of an old-fashioned fire-place for eating up wood; yet he can live on very little, and miserably poor stuff at that. The goat ought to be an authority on the food problem, for he has investigated it from the sides of poverty and plenty, and of all qualities from good to wretched. No doubt he prefers good pasture, and some vegetables and grain, with a few busnes as an appetizer, but he will exist on paper, banana peel, weeds and rubbish of various kinds. One point in his favor is that he is a healthy animal. He takes plenty of exercise, believes in pure air, and the pinnacle on which he stands in the picture is typical of his nature. Who ever heard of a goat having consumption? It is claimed that he is immune against tuberculosis germs. Goat's milk is said to be excellent for consumptives, and the flesh is recommended for those who are afraid of getting disease germs in beef or other meat. The goat population of New York County, according to the last census, is 226, and that of Kings and Queens counties, covering the suburbs of Brooklyn, 1,134. Of course most of these goats are on the outskirts of the city, but a few are kept in stables in the tenement districts, and last year one of these was running around on St. Patrick's Day with his horns painted green in honor of the occasion.

FARMING UNDER DIFFICULTIES.—Many of these squatters try to cultivate a little ground near their shanties. I remember one who, on a piece of rough land 100 feet square, with the ledge cropping out here and there, raised sweet corn, cabbages, potatoes, beets and other vegetables, which he peddled out at good prices, picking up quite a number of dollars in this way. During dry weather he had to carry water some distance to save the plants, and probably

did enough work to take care of an acre of good land, which would have yielded much more in proportion. To guard against thieves he kept two bulldogs, and also had to be on the watch much of the time himself in addition to the dogs.

HAVE THEIR TROUBLES.—Boys and rowdies are a great bother to people near large towns. Boys, particularly those who have not been well trained at home, are likely to make themselves obnoxious, and this is expected to a certain extent, but a big overgrown rowdy is an inexcusable nuisance. Around every village some of these may be found, and the city crop is unusually large. This genus is worse than the dog in the manger, for he won't stay in the manger. His idea is to torment somebody else, some weak and inoffensive body, of course, for he is too big a coward to trouble those who can defend themselves. The squatters suffer greatly from these pests, who seem to think that, as they have no real titles to their homes, they ought to be made as miserable as possible. Two women living alone in their own house on the outskirts of a city were tormented to an awful extent. The rowdies stole fruit and chickens, tore down the dooryard fence, and in the middle of the night would throw stones at the house, try to pry open the windows, yell and groan and do all manner of outlandish things. It is not surprising that the women were frightened. Their remedy was to alarm the neighborhood by blowing a horn, a proceeding somewhat suggestive of the end of the world to anyone who hears it for the first time. The neighbors then turned out with lanterns and went to the rescue, but, of course, the roughs got away before they could be caught. These night rescuing expeditions got to be a regular thing, and would have been amusing if it had not been for the real fright of the women. I knew of one young rowdy, however, who ran into justice with barbs on it. A large, muscular man was keeping "bachelor's hall" in a room over a wagonshed. Some of the smart town boys thought it would be a good scheme to torment him, so in in the evening they would go up the stairs, rap at his door and then run. They had played this trick twice one night and the man was waiting for them the third time. The instant the head one touched the door it opened; a long arm reached out into the darkness; and the rapper disappeared inside the room with a speed equaled only by that with which a toad gets away with a fly. Just what happened inside the fellow never understood. The floor, chairs, table and walls, went round and round and upside down. The performance ended by his entertainer throwing a pail of water on him and rolling him out the door. One lesson of that kind was enough for him. W. W. H.

EXPERIENCE WITH BEARDLESS BARLEY.

BEATS OATS.—I have sown the beardless barley for several seasons; with me it pays better than oats, because it yields as many bushels to the acre or more if sown on good ground; besides, it weighs more to the bushel. It makes a splendid dairy feed ground with equal parts of corn and oats; also for fattening hogs. It is considered an excellent feed for laying hens. This time of the year, when eggs are bringing 25 cents a dozen or more, I like to go every week to market with a good-sized basket. But it does not pay to sow Spring beardless barley on poor soil, because it grows and ripens in so short a time. It ripens three or four weeks before oats. If sown early it ripens before wheat. S. L.

Columbiana, Ohio.

BARLEY AHEAD OF OATS.—The query in a recent issue of THE R. N.-Y., "Is beardless barley worth raising?" would be read with considerable surprise by a majority of the farmers in this vicinity. More barley is raised here since the introduction of the beardless variety than before. Many farmers formerly did not raise this crop on account of the unpleasantness of handling it. The beardless variety is as pleasant to handle as oats. I know of no one who has abandoned the raising of this grain, while one seldom sees a field of bearded barley. In fact, I know of only one field in the neighborhood. I had the pleasure (?) of loading a part of this crop as it was being drawn to the machine. I imagine I see those long exasperating beards coming at me yet. Beardless barley will yield from 20 to 50 bushels per acre, depending upon the soil and season. One farmer raised 120 bushels upon two acres. This was counted an extraordinarily large yield. Soil that will produce 50 bushels of oats will produce from 35 to 40 bushels of barley. Comparing the value of the two crops per acre we have something as follows: 50 bushels oats at 20 cents equals $10; 40 bushels barley at 35 cents per bushel equals $14, or $4 in favor of the barley. The above prices were paid at the last harvest time. It is clearly evident that under favorable circumstances barley is a more profitable crop than oats. I intend to sow beardless barley the coming Spring to the exclusion of the latter crop. Being harvested about the time wheat is harvested, catch crops may often be sown, while after oats such a course would be impracticable. Many farmers failing to secure a wheat crop disk or cultivate the ground and sow barley. Being short and erect a good catch of grass and clover may be secured if a four-year rotation is desired. One more advantage is its superior feeding qualities when ground. There are no harsh, coarse hulls, which the pigs dislike so much in ground oats. To me it seems that the disposition of farmers to keep in the rut traveled by their predecessors accounts for the fact that a greater number do not sow this valuable grain. J. D. P.

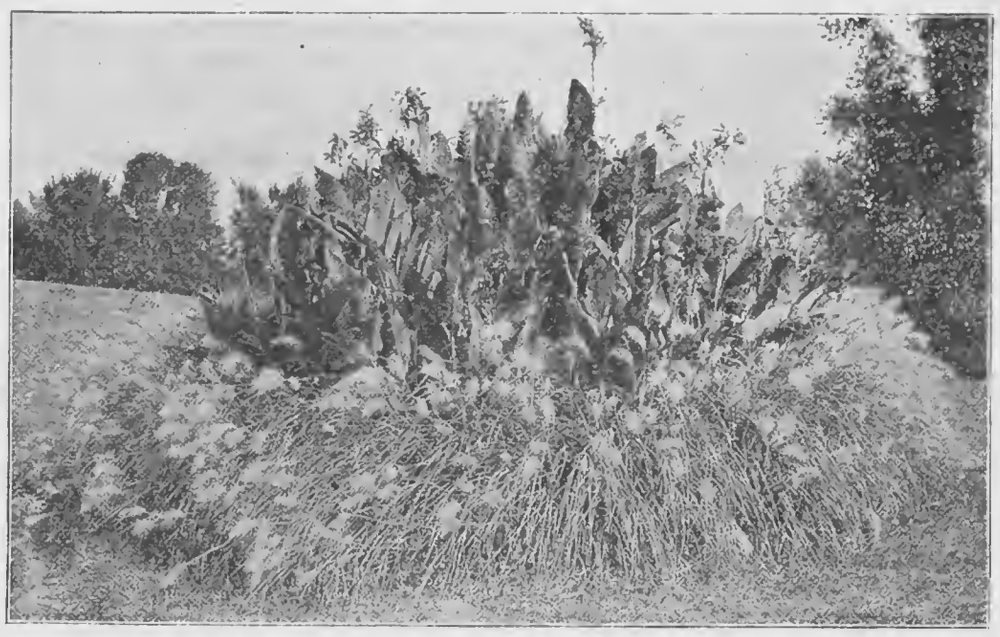
Archbold, Ohio.

BEARDLESS BARLEY HAY.—When you ask: "Is beardless barley worth sowing?" I suppose that you refer to common beardless barley. I have no figures to offer as to its productiveness, but have always considered it worth at least $2 more per ton for hay than the common bearded barley; also from observation it does not yield quite as much either hay or grain to the acre. We now have a beardless Chevalier barley that originated in this county. It does not, apparently, yield quite as much hay or grain per acre as the common Chevalier, but last year (1899) one of our fields containing 23 acres yielded 464 bags of nice plump barley, weighing 115 pounds to the bag. I consider good clean beardless barley hay unequaled by anything that we raise here, for horse feed. Farm or driving horses will do good work on this hay alone. We work and drive about 20 horses the year 'round, and for two years have not fed any grain with the hay, and the horses have never worked harder nor kept in better condition. The beardless Chevalier barley hay is an exceedingly pleasant hay to handle, and there are no beards to hurt the horses' mouths. When left for grain and thrashed the straw makes a valuable feed for dry cows, calves and idle horses and colts. H. G. KEESLING.

California.

FOR NEW ENGLAND.—My experience with beardless barley has not been altogether favorable. I had hoped much from it, as I found that common barley fed green caused a good deal of coughing among the cows. I do not know that the beards are really injurious, but I do not like to hear cows cough hard while eating it. The beardless variety is perfectly satisfactory as food when it will grow, but I never could get a large crop of it, nor would it stand up as well as desirable, but falls down and is difficult to mow. Another fault is that it is exceedingly difficult to thrash with flails. I presume that a thrashing machine would get the grain out from the straw, but these machines are all out of use in this section of the country, so if one wish to save one's own seed the flail has to be used. Beardless barley is hulless, like wheat and rye, but it does not as readily shell freely like these. I hope others have been more successful with it than I have, or may have found a variety that is more desirable. Barley seems to be almost indispensable as a green feed to grow and use late in the season. I have often mowed and fed it so late in the Fall that I had to wear mittens while cutting and carting it. A. W. CHEEVER.

Massachusetts.



CANNAS BORDERED WITH PENNISETUM. FIG. 38. SEE PAGE 108.

WHERE trash does not clog too badly, we greatly prefer the jointer on the breaking plow, since it turns the sod and trash and weed seed into the bottom of the furrow. This renders the planting and tillage easier and allows the use of the weeder. E. H. C.

THE "NEW" FARMER.—So the commission man wants a "new farmer!" Well, two years ago, when the western buyers were after New England apples, how did they do their packing? Top and bottom of barrel faced up, and the middle all small stuff—an object lesson for the amazed farmer! This told me by one who sold. J. W. B.

CROWDING APPLE TREES TOGETHER.

A New Plan for Large Crops.

CROWD THE TREES.—You will find it very difficult to gather statistics of an orchard, at the present day, that will give anything near what we may expect from one that is properly cultivated, fertilized and sprayed. I think, however, that in a few years there will be typical orchards bearing, when statistics may be had that will startle many of our farmers by the large yields and profits obtained from them. From what I have seen and learned, I am satisfied that apple trees of many varieties may be brought into full bearing at four years after being set into the orchard. I have seen apple trees the fourth year after planting out, bear one-half bushel of apples per tree. I once saw an orchard here in which 90 trees bore, the eighth season after being set into the orchard, 206 barrels of picked apples. These 90 trees were composed of Baldwin, Rhode Island Greening and Roxbury Russet, and were set 18 feet apart. I am not an advocate of large apple trees with tops spreading 30 to 35 feet, and going up into the air 25 to 35 feet; requiring a 30-foot ladder to gather the fruit, but prefer to set my trees 18 feet apart, using 135 trees per acre, and when the trees are four years old, and come into bearing, stop all other cropping and let the trees have all the ground to grow and mature their fruit. I would, however, fertilize and cultivate the orchard as I would for any crop.

CUT TOPS BACK.—By setting the trees 18 feet apart I have 100 trees more to the acre to bear from the time they are four years old and on. This makes the orchard itself pay a good profit for the land, and there is less reason or desire to crop the land with some other crop, as would be done with only 35 trees to the acre. These trees would bear for 15 years before crowding, when the top of every other tree should be cut back to as near the body of the tree as could be done, and not leave the limbs too large; the same as would be done if the tree were to be top-grafted. A new top of young thrifty growth would start out, which, of course, would need to be thinned out properly, and in three years, the trees would be in full bearing again, when the tops of those not cut back may be served in like manner. By this method of treatment the top would be kept young; the fruit be grown on young and thrifty wood, and the apples easily picked and trees easily sprayed over those low heads. When the trees crowd again, let the tops be cut back as before, or take out every other tree entirely. As money from the orchard is the object, thus planting the trees 135 to the acre and keeping the tops within a radius of about 16 feet, more apples will be taken from the orchard in 20 or 25 years, and at less expense per tree, than would be from the same ground with trees set 35 trees to the acre in 50 years, for there are 100 more trees per acre to bear fruit, and on thrifty, vigorous young trees.

BUSINESS TREES.—The above plan is for those who have made up their minds to go into orcharding for the profit there is in it, making it their business, and not a secondary thing. If the orchard cannot have the use of all the land, and proper feeding, cultivating, spraying and trimming, as well as thinning out the fruit when necessary, then go on the present system. Set the trees 35 to 40 feet apart, and get all you can from the land by putting it into grass or other crops. Those who thus plant their orchards and crop them, will be the ones who will proclaim aloud that orcharding does not pay, as thousands are shouting at the present time. There are many things on our farms needing great changes if profitably conducted, but there is nothing where a more radical change is required than in the present system of orcharding, as it is done on most of the farms, if profit is to be derived from it. A new departure must be taken if we would grow apples at a profit. Orchards should have no off years, but should bear every year an average of two barrels per tree, or 250 to 300 barrels of picked apples per acre should be annually gathered, after the orchard is five years old until 15 years old. After this, a much larger yield may be annually expected. Feed and cultivate the trees, and the trees will feed you. Apples raised from trees thus fed, cultivated, sprayed and thinned, will find ready market at very remunerative prices. Care should be taken in the selection of varieties, as some varieties are earlier and more abundant bearers than others. I have found Baldwin, Rhode Island Greening, Roxbury Russet, McIntosh Red, Jonathan and Hubbardston to be early, profuse bearers, and fine selling varieties. At the present day, success in orcharding is only reached by abundant feeding, thorough cultivation, timely spraying, trimming the trees and thinning the fruit. EDWIN HOYT.

Connecticut.

A TALK ABOUT JAPAN PLUMS.

The Essential Principles Boiled Down.

CONDENSED WISDOM.—Fifteen years' experience and time; money and thought spent watching and studying trees on plum roots or peach roots, in rich land, poor land, big holes, little holes; effect of severe thinning, no thinning, pruning, fertilizers, frost; trying to raise a profitable plum; boil down to a page or less for the benefit of the man with the plum fever. The Editor of THE R. N.-Y. does not ask much! First let me say to him who would invest money in Japan plums, think twice before investing capital which can be used at a profit with your present crops, for of all the fruits I raise plums pay the least. Yet there may be locations where they will prove a profitable venture, and every home should have a few. Learn to know a *good* plum, with a determination to raise it, for of all neglected cultivated fruits no fruit so poor, so worthless, which no market wants, can be so easily raised as Japan plums.

SOIL AND LOCATION.—They will grow on any soil not too wet, and in almost any location. But best results can be obtained by choosing a high, sunny, fairly dry location, with good frost drainage; good corn land we in the East might call it. Yet I have had better success with a poor sandy or gravel soil by fertilizing to meet the needs of the tree, than in a moist and rich one. A high location is a protection from Spring frosts, less danger from winterkilling, for with our changeable New England climate (13 below zero January 20, 7 A. M.; 41 above January 21) a location subject to 20 below zero has reached the danger point for successful plum culture; 15 below and a sudden change may cause loss. Location counts for him on the border line of successful plum growing.

TREES.—Choose good one-year trees four to five feet, budded upon *peach stock* unless by chance trees might be obtained budded upon Japan plum seedlings. Do not accept older trees as a gift. Set 13 to 16 feet apart; the poorer the land nearer the tree; this distance for those who will adopt severe pruning. For the grower who lets his trees grow, and takes what he can get, 20 feet may be near enough. On poor sandy or gravelly soil we have found large holes 18 inches to two feet deep, filled with top soil, a profitable investment. Set trees so that when the ground is level the plum wood shall be two to four inches under ground; the drier the land the deeper the tree. I might say right here that for the last 10 years we have set all trees deeper than recommended by the books. The tree stands firmer, is less liable to damage by wind, and in a measure grows upon its own roots. Trees of Abundance-Wickson type (upright growers) should be cut back for low tops 12 to 18 inches high; spreading varieties (Burbank type) two to three feet.

CULTIVATION.—Cultivate all the ground as early as it can be put into mellow condition. The man with the small orchard, who can raise at a profit crops which do not shade the trees (early potatoes, berries, etc.), can for the first two years more cheaply care for his orchard this way than any other. I never yet saw a young orchard injured by doing so. *But do not plant small fruits in a plum orchard.* We prefer to cultivate only the trees, and grow a humus crop to plow under. Yes, grow something, if only weeds and Witch grass. Then when trees begin to bear we reverse the cultivation; cultivate between the trees and allow a sod, what the plow and Cutaway harrow do not destroy, to grow around the trees. The trees are less liable to damage by winds, and of more importance to us; the base of tree is less liable to damage from freezing.

PRUNING; THINNING.—First grow the tree; this will require good judgment, as young trees require thinning of surplus branches, cutting back of previous season's growth, so as to form a fairly open, well-balanced top. When tree is large enough to bear fair crops of fruit severe pruning is adopted if tree is in proper shape. All of the previous season's growth is cut back to three to six inches, and surplus growth is cut out entirely, and as the trees grow older, all growth may be cut back to two or three inches. With this method and thinning of fruit we have been able to raise a crop every season. Japan plums must be thinned. After hiring 250 heavily-laden trees thinned by hand at a cost of nearly all the profits, and the loss of a large proportion of our large (two to 2½ inches in diameter) Burbanks by cracking, we have adopted a medium course. Our severe pruning has done a large part of the thinning. Then as fruit begins to grow we practice shaking. Don't get a lazy man for this job, but a strong, active one, for the tree should not be pushed back and forth, but given a quick, sharp jerk. Then after fruit is through dropping, trees are gone over by hand with the aid of more shaking, but the job is not done so nicely that no two plums may touch; yet as a rule we do not intend that they shall do so. If black rot appears this is picked by hand, and if much appears is done every day. We find this very important.

FERTILIZERS.—Not too much nitrogen, a fair amount of phosphoric acid, and plenty of potash; the average grower is in little danger using too much of the latter, especially if the sulphate is used. We find the double sulphate of potash and magnesia very useful at least part of the time. Use nitrate of soda only to keep the trees in a healthy condition, for many a yellow, half-starved tree may be brought back to a life of usefulness if horse power and perhaps a small amount of elbow grease is used as a help to the nitrate of soda. From a business standpoint it does not pay to doctor a sick tree. Yet it is better not to lose one's head over the yellows talk, and perhaps do more damage than the disease itself. Study your own conditions, and draw correct conclusions from your own experience, and ideas of value from that of others. Do not expect to learn it all from them, but attend strictly to business, give good care to your trees, and they may return you a small margin of profit.

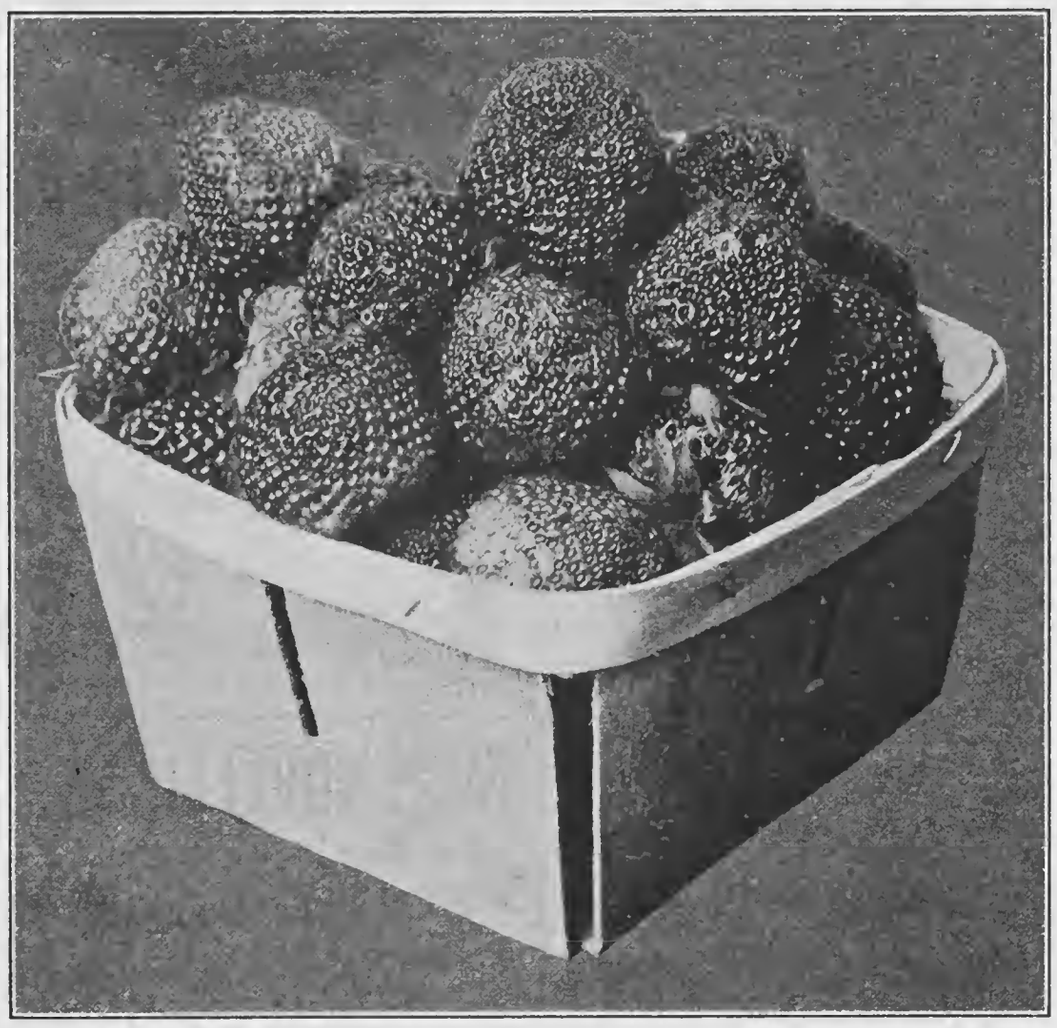
Massachusetts. H. O. MEAD.

NOTES ON CEMENT MIXING.

I have done an immense amount of cement work, and have also had an extensive experience in building, and my experience has taught me, with much bitterness, the fact that masons and carpenters are a narrow, contracted, one-idea class. They all keep in the same rut, and it takes a mighty sight of crowding even to get one of them out of it. Now anyone of fairly good sense can make a splendid sidewalk or barn floor with three inches of grout and three-quarters of an inch of top coat. These points only are necessary, and they are absolutely so: A firm, solid foundation, good fresh cement *thoroughly* mixed with gravel or sharp sand; the grout must be solidly tamped and the top coat must be put on the grouting within a few hours. It is best to do it at once. Two hundred pounds (one-half barrel) of Portland cement to 100 heaping shovelfuls of good gravel is ample for the first, or foundation coat, and three inches is ample of thickness. To save material this should be laid evenly, by gauge, over an even foundation. The top coat should be two parts of sharp screened sand to one of cement, and troweled down perfectly smooth, leaving not a single hole, however minute, by which water may reach the foundation and freeze there. It is generally more convenient to put the top coat on as the operator proceeds, and best that it is done then, but protected from the sun one can wait 24 hours before applying it. An inch coat of earth or sand should be applied as soon as the top coat has set or hardened enough to prevent the earth sticking to it, and it is best that this dirt or sand should remain there a week. This is done that it may dry slowly and evenly. Masons will tell you to use five to one, even three to one for grouting, and half and half and five to three for top coat, but I know that nine to one (with plenty of elbow grease) for grouting will last forever.

If the operator has more time than money, screen your gravel, use nine to one, mix it thoroughly, and then mix it a little more, and tamp it in the same manner. Cement sidewalks laid on the principal street of this city 30 years ago are just as good as when laid, showing absolutely no wear whatever. A cement wall can be made for one-half the cost of a stone wall; it will exclude all dampness, and last forever. Any man of sense can make it, too. In all my experience in building I have never found but one carpenter who knew how to hang a door, and I have never known a mason who knew how to top out a chimney. Stand over a mason and you can make him draw in the top of a chimney to a little more than half the size of its flue, but he'll never do it otherwise, and yet this is the only way a chimney should be topped. Your rule for cement floor on page 53 would make it cost four times more than necessary, and sand or earth is less expensive than hay and 10 times better, too. We make here street crossings of cement, which stand the heaviest traffic; also plain and ornamental window sills and caps, water tables and many other things. S. E. BARRY.

Indiana.



NEW STRAWBERRY MARIE. FIG. 39. SEE RURALISMS, PAGE 108.

SAND OR WINTER VETCH.

Of this genus of legumes there are numbers of species, but few of them have succeeded here in this country. The particular one to which I would call special attention (Hairy vetch, Vicia villosa) is a native of Russia, and was introduced into this country by the Department of Agriculture in 1886. It is a very hardy annual, usually remaining green during the entire Winter when left undisturbed, and where mulched by its own top of late Fall growth. To those unfamiliar with vetches it may be said that they are very much like peas, bearing slender leaflets, small stalks, small blue flowers and a small seed about the size of a No. 2 shot, and almost as round. This vetch is usually considered a Winter variety, but may be sown in the Autumn or Spring. If in the Spring, the last of April or first of May; if in the Fall it should be sown early, certainly not after the middle of September. The ground should be at least moderately fertile, and should have thorough preparation. The seed may be sown broadcast, or may be put in with a drill at the rate of 30 pounds per acre. If sown broadcast it should be harrowed once over to cover the seed. The plants grow very slowly for the first few weeks, and if sown in the Fall will not cover the ground before the following May.

After it is once well rooted, it grows much more rapidly, and if undisturbed will soon form a dense growth, covering the ground completely. It is relished by sheep, horses and cattle, but is regarded as especially adapted to sheep. Like other leguminous plants it is especially rich in albuminoids. It may be pastured, but I believe will be found more useful as a soiling crop. For this purpose it may be sown with oats, which will hold it up sufficiently to permit cutting with the mowing machine. It should be cut before or while in blossom, as the stalk soon begins to dry after the blossom has passed off. From the experience I have had with it I cannot think it more valuable than clover as far north as Ohio and New York. Our experience indicates that it will make a good Summer growth, will keep green during Winter if not pastured or cut too close in the Fall, but will not bear Winter pasturing in this latitude. For a sheep feed I believe it is superior, pound for pound, to any leguminous crop we can grow, but we cannot produce as large crops of it as we can of clover. Like other plants of its kind it is regarded as an excellent crop for green manuring, and from its manner of growth, on account of covering the ground so completely, there is good reason to believe that it is one of the best of the Pulse family for this purpose.

Spring vetch (Vicia sativa) is a variety very closely related to the so-called Winter vetch. Its habits of growth, color of flowers and general structure are almost identical, but in our experience it has not given as promising results as the Winter variety. Sheep breeders, especially those who breed and enter the show ring, might find the vetch a great help in giving variety of feed. It may fill a place to advantage in soiling, but as a general farm crop, I have not found it to work in with convenience in any ordinary rotation. J. FREMONT HICKMAN.

Ohio Experiment Station.

THE English Society for the Promotion of Kindness to Animals is endeavoring to have the protection accorded by the Geneva convention to those who tend wounded men on the field of battle extended also to those who tend wounded animals.

Do Curculios Crawl or Fly?

F. F. H., Decker, Mich.—How does the Plum curculio get into the tree? Does he fly or crawl? If he cannot fly I have a remedy which I intend to apply to the bark in a ring around the tree, which prevents all insects from going up it.

ANS.—Possibly a few Plum curculios crawl up into the tree, but they fly readily, and I think a large proportion fly into the tree; certainly most of them would if they met with an obstruction on the trunk when they were trying to crawl up. I doubt whether anything around the tree trunk would prevent one curculio in a hundred from "stinging" the fruit. M. V. SLINGERLAND.

Starting Peach Pits.

S. B. D., Jackson, Mich.—What is the best way to start peaches from pits, or, in other words, the process followed by nurserymen in starting peach pits?

ANS.—Peach seedlings are usually grown from selected pits collected as soon as the fruit is used, and kept in a cellar or some place where they will not dry very hard until late Fall, when they may be planted in rows, four feet apart, and three or four inches apart in the row. They should be covered about two inches deep. Many nurserymen prefer to bed the pits, or sow them very thickly over a prepared space of level ground and cover with about three inches of soil. The next Spring the sprouts are taken up with a trowel, when three or four inches high, and transplanted to the nursery rows for growth until the budding season. The pits can also be stratified in boxes of moist sand and exposed to frost during Winter and planted in rows next Spring.

Celery After Celery.

G. W. D., Farmville, Va.—I have a piece of flat land, soil of which is gray. It has been in celery two successive years. Will it be suitable to plant celery there again the coming season? The land has been heavily manured both years with farmyard manure and commercial fertilizer. I would like any information you can give me, both as to manuring and cultivating celery as a crop for market. My reason for asking about planting in the same place again is that this piece of land is more readily irrigated than any other on this farm, and our Summers are generally very dry.

ANS.—The custom of planting celery for many successive seasons in the same plot is quite general, and the soil is usually cropped with early peas, lettuce, or some quick-growing crop in the early part of the season in order to utilize it and keep the weeds down. It requires a highly-enriched soil to grow good celery, and when a plot is brought to a suitable condition it is safe to use it until positive disease appears. The fertility must be kept up by repeated applications of manure. The Celery blight, a most destructive bacterial disease, is apparently quite as likely to be communicated by germs floating as dust in the air as by soil infection.

Chestnut Culture in Pennsylvania

J. B., Huntingdon, Pa.—What is your opinion of central Pennsylvania soil and climate for European and Japan chestnuts? Will they grow and produce fine nuts on poor ground? Where do they thrive best, on high or low ground? Do they require cultivation? Do you know whether any large orchards pay?

ANS.—I have had no experience growing chestnuts in orchard for commercial purposes, although I have a number of trees growing in my grounds for home use. It seems to be conceded by men who have experimented extensively, that European, Japan and native chestnuts can be easily grown if grafted on young seedlings, and the trees planted where they are to grow when one year old. Each succeeding year in age adds to the risk in transplanting. At the recent meeting of the Pennsylvania State Horticultural Association in Harrisburg, the grafting of the finer kinds on sprouts growing from the stump in a chestnut clearing, was pronounced a failure by those who had tried it. The labor required to keep down the wild sprouts and the briars and underbrush, and the trouble of gathering the nuts on rough, rocky ground, usually costs more than the crop is worth. But the greatest drawback to success in commercial chestnut culture is the Chestnut weevil. No plan has yet been devised that will protect the crop from its ravages, and it is increasing in numbers every year. Until some preventive remedy for this pest shall have been discovered I do not believe chestnuts can be made to pay as an orchard crop. GABRIEL HIESTER.

Catarrh and Chilblain "Cures."

W. O. E., Whitby, Ont.—On page 20 I notice that for catarrh dry bicarbonate of soda is recommended to be used as snuff. That will upon trial be found rather painful, I think. In my opinion boric acid finely powdered will do better, because much less painful, and equally or more effectual. As a medication for chilblains I have found an application of a saturated solution of bisulphite of soda as good as anything. Prevention in this case is easier and better than cure. As a boy I had each Winter painful experience of this trouble until my mother provided me with a pair of shoes made with uppers of thick cloth with a rough nappy surface, after which I never had any more chilblains. Sawing cord wood when two men or man and a boy are available may be done to advantage with a large cross-cut saw. It is quicker, easier and not hard on the back.

ANS.—We have used the bicarbonate of soda for several years, always with good results. True, it is painful at times, but very effective. Another suggested remedy for chilblains is sent by A. H. M., Massachusetts, as follows: "Put about three-quarters of an inch of hardwood ashes in the bottom of the foot tub, just cover with hot water, have it a little hotter than one can stand at first, get the bottoms of the feet in it as soon as it can be borne at all, then as soon as they feel comfortable, add a little more very hot water and replace the feet. Keep them in the water—as hot as one can bear it—for 20 or 30 minutes. Rinse, dry thoroughly and then one is ready to retire. Very bad cases may need a repetition every other night for a week."

WHEN you write advertisers mention THE R. N.-Y. and you will get a quick reply and "a square deal." See our guarantee 8th page.

For the land's sake, use Bowker's Fertilizers. They enrich the earth.—*Adv.*

SECOND-CROP Seed Potatoes. Earliest and best seed grown. Catalogue free. A. A. WHITTINGTON, Marion Sta., Md.

Vineland Sweet Potatoes—Headquarters for choice selected seed; all leading varieties. Shipments made any time after February 1. Write for prices. H. TAYLOR, Box 40, Vineland, N. J.

SEEDS At Wholesale Prices. We raise Vegetable Seeds, Seed Potatoes, Farm Seeds, etc., on our own Farms, and sell them direct to the planter at Wholesale Prices. Catalogue free. Please write for it to-day. Don't delay. JOS. HARRIS CO., Moreton Farm, Coldwater, N. Y.

BURPEE'S FARM ANNUAL FOR 1901
"QUARTER-CENTURY EDITION"
A Grand New Book of two hundred and twenty pages. Entirely rewritten at our famous FORDHOOK FARMS—the largest Trial Grounds in America. New Directions for culture, New Leaflets, New Novelties of unusual merit in both Vegetables and Flowers, Elegant New Colored Plates. The Quarter-Century's Record of Progress, New Cash Prizes, and other New Features. The largest, most complete, and BEST SEED CATALOGUE ever published. Mailed for ten cents, which is less than cost per copy. Name this paper, send ten cents (silver or stamps) and with this great catalogue we shall send a 15-cent packet of either Burbank's *Unique Floral Novelty* or Burpee's wonderful, new, dwarf, meaty, bright-red, earliest Tomato,—"*Quarter-Century.*"
☞ Should you object to paying ten cents for a seed catalogue (even though it is worth a dollar), then write a postal card for Burpee's "SEED-SENSE" for 1901,—a "strictly business" catalogue of ninety pages. W. ATLEE BURPEE & CO., PHILADELPHIA, PA.

Cow Peas and Bacteria.

C. W. M., Licking Co., O.—Last Summer, knowing that mulching material for berries would be scarce, I acted upon a suggestion in Hope Farm Notes, and in June sowed a patch of cow peas. We had a severe local drought, and the peas did not make much growth, but at about a foot high formed pods. A good rain came about this time, but this patch of peas did not grow afterwards. A small patch of peas sown on an old strawberry bed plowed down in July had not formed pods when the rain came, and the peas on this patch made a larger growth of vines than the earlier sown, yet neither patch made enough growth to make much mulching material. There is now every prospect that straw will be scarce another Fall, the wheat fields looking poor at this time, and I must be on the lookout for mulching material. On making an examination of the pea roots I cannot find any tubercles (knots or nitrogen traps), and the question arises, was the small growth of vine due to the variety, dry weather or lack of tubercles? The peas I sowed were to me an unknown black sort. What variety would you recommend for the latitude of central Ohio, to make the most mulching material? What method would you recommend to get the bacteria in my soil, that would put the "knots" on the pea roots? The land I had in peas is intended for potatoes in 1901, and I followed the peas with rye. Would it not have been better to follow with the Hairy vetch?

ANS.—Last Summer was rather a crusher with many who tried new plants, as the hot, dry weather was against any such experiment. Our experience is that cow-pea vines make a most excellent mulch for strawberries, when we can get enough of them to cover a reasonable sized area. This past year we have experimented with eight different kinds of cow peas; Early Black makes a vine 18 inches or two feet high, which runs perhaps three or four feet in a good season. When these vines are cut just as the pod forms, and before the leaves fall, they will make without doubt a good lot of vine growth for food or fodder, and will start a second growth. The Whippoorwill makes a larger vine, and this year matured seed of good quality in northern New Jersey. These two varieties are best suited to the North, as they are sure to make seed, and that is a desirable thing where one intends to grow this crop year after year, for the seeds are quite expensive. A variety know as Wonderful, and another known as the Red Crowder, made with us several times the vine growth of either Early Black or Whippoorwill, but matured practically no seed. If you want a vine that will mature take either Early Black or Whippoorwill; if you simply want vine growth for mulching or fodder, we would advise either Wonderful or Clay or Red In regard to the formation of the tubercles on the roots we found some singular things in our last year's experience. Where we planted the seed on poor ground, without any fertilizer, and without much care, the roots were practically alive with the tubercles. Where we used nitrate of soda, or put the peas on good ground, there were practically no tubercles at all.

We planted Soy beans for the first time last year. Having heard so much about soil inoculation, we determined to try to see what there was in it. For this reason we sent to Massachusetts and obtained 100 pounds of ordinary soil out of a field where Soy beans had been grown. We scattered this earth at the bottom of one row when the Soy beans were planted, while the adjoining rows had nothing of the kind put in the furrows. These rows were about 400 feet long. The only tubercles to be found in connection with those Soy bean plants were where that inoculated soil was put, and we are forced to the conclusion that the scientific men were right in saying that we introduced the bacteria to our soil when we imported that earth from Massachusetts. Our experience with the cow pea leads us to believe two things: First, that after a series of years these bacteria will come in of themselves, and produce the tubercles on the roots of the plants. This, however, will take more time than most people want to spend. We are also convinced that the bacteria may be introduced to the soil after the manner in which we brought Soy bean bacteria to the farm, namely, by bringing soil from a field where the plants had made the tubercles. We do not believe it would pay simply to broadcast such soil over the field. The way we would do, if we wanted to make haste, would be to plant one row of the cow peas in a drill about as one would plant beans. Get a peck, more or less, of soil out of some field where these cow peas had been grown successfully, put that at the bottom of this row, drop the seeds right on it, cover them over, and then let them alone except for occasional cultivation. Do not use any manure or fertilizer with them. The chances are that in the Fall one would find those cow-pea roots alive with tubercles, and another year by digging up the soil of that row and using it on a larger area, the bacteria would be introduced all over the farm, or at least wherever cow peas were sown. This thing was actually done at the Kansas Agricultural College with acres of Soy beans. A ton of the soil was originally brought from Massachusetts, and from it a number of rows were inoculated so that they got soil of their own in proper shape. This was drilled in with the Soy-bean seed about as we would drill in a fertilizer. This subject is one of great interest, although we have yet to demonstrate that it has any great practical value for us. All of us are benefited by trying a few of these things on a small scale, even though they do not always bring a barrel full of dollars.

Hen Manure and Chemicals.

A. S. A., Westboro, Mass.—I have seen much in THE R. N.-Y. about making a good fertilizer with dry hen manure and chemicals, and as my fertilizer bill is large, I should be glad of some way to cut it down. The fertilizer that gives me the best results has a guaranteed analysis of nitrogen, 3.30 to 4.12 per cent; available phosphoric acid, 8 to 11; potash, 7 to 8. Not knowing just how to figure these things out myself, will you put down the quantity of each needed in the following mixtures?: 1. Dry hen manure, superphosphate of lime, muriate of potash, nitrate of soda (if needed.) 2. Dry hen manure, pure ground bone, muriate of potash, nitrate of soda (if needed.) 3. Dry hen manure, dissolved bone black, murlate of potash, nitrate of soda (if needed.)

ANS.—Every year we have numerous questions about hen manure. Most people give this manure a higher value than it deserves. It is the strongest of our domestic manures, but not nearly as strong as Peruvian guano. Here is a table giving average analyses of the substances which you desire to mix. The hen manure analysis is an average of many dried samples:

Pounds in 100.

	Nitrogen.	Potash.	Phosphoric Acid.
Dried hen manure	2½	2	3
Acid phosphate	..	..	14
Nitrate of soda	16	..	..
Ground bone	3	..	25
Muriate of potash	..	50	..

This hen manure is supposed to be pure and well dried with plaster or road dust. After drying it is broken up, crushed and sifted through a fine wire sieve. A. S. A.'s standard fertilizer must contain 66 pounds of nitrogen, 160 of phosphoric acid and 140 of potash. The first mixture is hard to make because in order to secure the high per cent of phosphoric acid you must use at least 1,000 pounds of acid phosphate:

	Nitrogen.	Potash.	Phosphoric Acid.
1,000 acid phosphate	..	..	140
500 hen manure	12½	10	15
250 nitrate	40	..	..
250 muriate	..	125	..
Total	52½	135	155

By using 75 pounds less of the hen manure and 75 more nitrate you will bring up the per cent of nitrogen, but still be low on potash and phosphoric acid. The thing to help this out is fine ground bone. Here, for example, is a mixture:

	Nitrogen.	Potash.	Phosphoric Acid.
400 bone	12	..	100
300 acid phosphate	..	..	42
250 nitrate	40	..	..
250 muriate	..	125	..
800 hen manure	20	16	24
Total	72	141	166

This mixture gives you three forms of nitrogen and two of phosphoric acid. In theory the analysis is equal to that of the fertilizer A. S. A. has been using, yet, of course, we cannot guarantee that it will prove as effective for all crops. Hen manure varies greatly, and unless it is made very fine and thoroughly mixed it will not give uniform results. We feel sure that this method of drying, crushing and mixing hen manure with chemicals is a good one for the general farmer.

WHEN you write advertisers mention THE R. N.-Y. and you will get a quick reply and "a square deal." See our guarantee 8th page.

ALL SORTS OF QUESTIONS ANSWERED.

Farm Crops in Orchard.

M. W. S., Fairlee, Vt.—Will it be best to grow some farm crop in an orchard of young apple trees while cultivating and growing them? If so, what crops are safest and best for the trees?

ANS.—Yes, it is well to grow crops of potatoes, corn, beans, squashes or something else that will require good tillage in an orchard while the trees are small. When they get five to eight years old this should be stopped. Red clover may then be sown, except for a space of four feet or so next the trees. This should be mown down and left to rot on the ground, and not taken off as hay. After about two years it should be plowed under, and the ground thoroughly tilled, without any other crop on it but the orchard trees.

Grafting Questions; Dwarf Trees.

A. R. B., Dexter, Me.—1. I would like to inquire if there is any way I can graft crab apples with anything, and make them live; if so, what stock is required? 2. I have a lot of different kinds of plum trees that have been set about three years. Can I top-graft them? 3. I wish to set a lot of dwarf pear trees this Spring. What kinds are best?

ANS.—1. The crab apples may be grafted on almost any of our ordinary apple trees. Thousands of them are budded and grafted on to common apple seedlings by the nurserymen. 2. Plum trees can be grafted with about the same certainty of success as with other fruit trees, but the work should be done earlier in the Spring than ordinary apple grafting, to attain the best results. 3. If Winter pears are desired the Lawrence is perhaps the best, but Angoulême is the most profitable of all pears grown as dwarfs. It is not a true Winter variety, but may be kept until Christmas in Maine.

Apples and Peaches for Michigan.

E. A. D., Reading, Mich.—I should like to know your opinion as to the best varieties of apples and peaches for home use, from earliest to latest, for southern Michigan. What do you think of the Mammoth Blacktwig apple?

ANS.—A good list of apples for family use in southern Michigan is about as follows: Early Harvest, Benoni, Primate, Fanny, Golden Sweet, Jefferis, Ramsdell, Fall Wine, Grimes, Jonathan, Red Canada, Wagener, Swaar and Stark. Some of the best peaches are: Triumph, Sneed, Bishop, Early Rivers, Mountain Rose, Elberta, Chairs, Fitzgerald and Heath Cling. The Arkansaw or Mammoth Blacktwig apple is a very good one for the region where the Winesap flourishes, but this is not quite true of Michigan. However, I have seen some good specimens of Arkansaw that were grown there. It is a dark red apple of medium size and fair quality. It keeps well.

Persimmons; Cherries; Chestnuts.

C. M. P., Bourbon, Ind.—1. Where can persimmon trees be bought, and what kinds shall I buy for planting in northern Indiana? 2. I have 200 cherry trees planted, all Richmond and Olivet, and wish to plant two more varieties, both sour, that will ripen later than Richmond, and will be suitable for planting here in northern Indiana. What varieties shall I plant? 3. What kind of chestnut shall I buy for planting here, and where can I buy the trees?

ANS.—1. There are almost none of the nurseries having stocks of grafted persimmon trees, from the fact that there is little call for them, and that they are hard either to bud or graft. Early Golden, Marion and Golden Gem are good kinds. Possibly the horticulturist of the Indiana Experiment Station at Lafayette may be able to direct the inquirer just where to get the trees. 2. Two good sour cherries for the date of ripening and region desired are Montmorency and English Morello. The former comes about a week after Richmond and the other about a month later. 3. Paragon would be a good variety of chestnut to plant. The trees should be set on light, well-drained land. They may be had of almost any leading nurseryman.

Russet on Baldwin Apples.

T. H. C., So. Framingham, Mass.—Standing in a row of Roxbury Russets I have a Baldwin apple tree. In gathering the fruit I found several of the Baldwins splashed with russet, in size from a 10-cent piece to nearly one-half the apple. Is this common?

ANS.—There is nothing unusual in a Baldwin apple having patches of russet on it, and I would not think there was any influence of the other variety in this case, nor in any others that might be likely to be observed. There are no well-founded cases of the effect of the pollen of one variety of fruit upon another of this character on record, so far as I know, but there are plenty of supposed cases.

The Culture of Dandelions.

Several Readers.—Is it true that dandelions are grown largely in this country in cultivated fields?

ANS.—The dandelion is but little grown in this country as a vegetable, other than in some parts of New England. Some of the market gardeners in the vicinity of Boston claim to have taken as much as $1,000 worth from an acre. The variety known as the Improved French Thick-leaved is the best and most generally grown. It is not at all particular as to soil or situation; in fact, it will thrive anywhere, but the larger profits are made in growing it on a heavy loam, with good tilth. The seed should be sown soon after May 1, but good results are obtained when grown as a second crop, the seed being sown as late as August 1. The soil should be finely prepared, as the seeds are very small, and the young plants, because of their dark color, are quite inconspicuous. Sow in drills one foot apart and cover thinly; roll the ground after sowing. In order to see where the rows are a little lettuce seed should be mixed with it, say two ounces to the acre. The lettuce will plainly show the rows. Cultivate in Summer so that weeds will not grow; upon the approach of cold weather, cover with any coarse litter and remove same in early Spring. One quarter of a pound of seed is sufficient for an acre.

C. L. ALLEN.

Asparagus Varieties and Rust.

My opinion, so far as experience qualifies me to judge, is that the varieties most subject to the rust are those to which large quantities of nitrogenous manures have been applied, thereby inducing a soft, watery growth. With dry weather following, the crop evaporates more water from the foliage than the root system can supply; as a consequence the plants become enfeebled and fall an easy prey to rust and similar diseases. On the other hand, the varieties most immune are those to which proper quantities of the mineral elements have been given, without unduly stimulating the crop. It seems to be generally conceded, I believe, that the spores of rust and many kinds of fungus will carry over, and reproduce themselves in the plants. I know this to be the case with asparagus and celery.

Pennsylvania. M. GARRAHAN.

We have noticed quite a marked difference in the varieties of asparagus for the last two years; the Palmetto is the least affected of all the varieties we grow; in fact, we have been bothered but very little with the rust yet on any of the varieties. We find that when planting asparagus seed following a peach nursery, we usually have better success, and are troubled with rust less than where planted on land full of vegetable matter; whether the growing of the crop of peach trees has anything to do with it I do not know. For planting in field culture we recommend the Palmetto above all others. The Argenteuil variety we do not grow, and do not know it.

J. G. HARRISON AND SONS.

ROGERS TREES are "TRUE AS STEEL."

When you read the label and plant the tree you know just what the fruit will be. THE TREE BREEDER (Free) will tell you why we say it, and the trees themselves will **prove it.** It also gives **prices, special offers and discounts for early orders.** We ask no more for **dependable trees** than others charge for the doubtful kind. No Catchpenny Schemes, no fake **wholesale** (?) prices, but **full value** in trees. The **Best Trees** for your money.

THE TREE BREEDERS.
THE ROGERS NURSERIES, Dansville. N. Y.

FUMIGATION WILL NOT COME BETWEEN YOU AND US, but we stand between you and danger when you buy **ROGERS TREES,** for we fumigate every tree you buy of us. It costs only 15c. to 50c. per 1,000 trees. You may run no risk without it, but it's surer when it's done. We belong to no nursery combine, we make our own prices, we grow our own trees and you will find it safe in every way to place your order to-day with THE ROGERS NURSERIES, **The Tree Breeders,** Dansville, N. Y.

HOPE FARM NOTES.

WITCH HAZEL.—Several weeks ago I published a note from a reader who advised us to plant witch hazel on our back fields, so as to make a Winter job of cutting the twigs to sell to the extractors. Here is a note from the other side:

"In regard to the witch hazel business, I think the man who has to plant the seeds, set the plants and wait for it to get big enough, would get tired of waiting, as it takes a large amount of small brush to weigh a ton, for which we get the sum of $4. Of course, small brush is worth more than large. I am a wagon maker and blacksmith; that is the only profitable part of the witch hazel business that I can see. There is a witch hazel mill, also a Black birch mill, within a few miles from here. Two years ago my brother hauled about 300 tons of witch hazel. We kept four horses instead of two; we got most of the brush off our own farm, but to be honest, I would rather shoe other people's horses and keep their wagons in repair to haul witch hazel than my own." L. E. W.

That puts a new face on it. I should say that our friend would better stick to his shop. I have written a number of large drug houses and manufacturers. They give little encouragement. It seems that bogus chemical mixtures are put on the market which injure the sale of the pure extract. As is the case with other things, the adulterators are injuring trade. The outlook for that Winter job is certainly frosted!

SILO OR SHREDDER.—The following sensible letter is at hand from a New York State man:

"I see that you have bought a shredder and cutter combined for your corn fodder. I have been anxious to hear from some one who has had experience with such a machine. It has been a question with me for some time as to which would suit my case the best, a silo or a shredder. I only keep from two to four cows, as the case may be; five horses and 50 sheep, besides some Angora goats, and, of course, hogs and chickens. While I think the silo all right for the dairy, is it profitable for the general farmer, including not only the expense of building, but also of refilling every year? While I believe everyone should be governed by circumstances and the contents of the pocketbook, yet it is often a question that puzzles one as to what is best for our own individual use, as regards the silo and shredder. I think there are cases where a tool works well and gives perfect satisfaction to one person; another gets disgusted and is in no way satisfied." O. B. M.

I do not feel competent to settle such a question. The silo men have some strong arguments, and I have listened carefully to them, yet, as I am situated, I do not believe that a silo would pay me. I have only three head of cattle. It must be admitted that the silo is most useful for supplying cow food. Some farmers feed it to horses and hogs, but I think the dry grain with roots and shredded dry stalks is better for these animals. In our country there is more profit in boarding a horse than in milking a cow, and I also believe that hogs pay us better. I think that a farmer should consider such things from the profit standpoint. How can I get the most out of my farm crops? If I had a large herd of cows, I think I should build a silo. If those cows were sold, I should let it stand empty. Not long ago I was in a Massachusetts farmer's barn. In one corner was a fine silo. When it was built the "tie-up" was full of cattle. It was found that peaches, plums and apples paid better than cows, and the latter were sold. Instead of buying stock to eat up the silage that farmer will turn the silo into a storage room for fruit, and it seems to me a very wise thing to do so.

GENERAL STOCK FOOD.—I want no quarrel with the silo men. Their work has proved a blessing to the dairymen of this country. It is my opinion, however, that shredded dry stalks with the dry grain will prove more satisfactory to the stock kept by the general farmer than will silage. We have not yet fed a mouthful of hay. The brood mare has oat hay once daily, but every other animal on the place has shredded stalks and waste molasses for roughage. The orts make good bedding. For grain we are feeding mostly bran and oats—reserving our corn until the horses begin the hard work of Spring. We shredded nearly two months' supply of the stalks at one time. We have been feeding about a month and the quality is still good. Of course, I understand that where one has a silo the work of cutting is all done at one time, while shredding means several different jobs. At Hope Farm I am satisfied that the shredded stalk is the cheapest roughage we can obtain for all our stock, and that it will enable us to sell hay, which brings $20 per ton!

THE HEN BUSINESS.—How are the Hope Farm hens doing this Winter?

So-so!

What does that mean?

Not as well as we might have made them.

How many hens have you?

There are now 52 old hens and pullets.

How many eggs do they lay?

From 10 to 15 per day the first week in February.

Why don't they do better?

Chiefly because they are too crowded. We had but one small house available, and they were all crowded into that. They have not had a fair chance.

Why not? We thought you pretended to be model farmers!

We have never pretended anything, and I must admit that our hens were neglected. Now, Charlie is trying to brace them up.

How are they fed?

In the morning he feeds a warm mash made of three parts wheat bran and one part ground corn and oats. The morning's mess contains a handful of oil meal and a small quantity of the condition powder made by Henry Holmes. At noon they get a small feed of damaged wheat, and at night whole corn. They have oyster shells before them all the time, and all the raw cabbage they want.

Do you call this ideal feeding?

No. There may be too much bran in the mash to suit some poultrymen, though we regard bran as being useful. I would like to feed more meat or cut bone, though the oil meal partly replaces it. If we had clover hay I would cut it and feed it steamed.

What breed are these hens?

A mixture. During last year we paid little attention to breeding. Other farm work was more important, and the hens did much as they pleased. We have Leghorns, P. Rocks, Brahmas, Wyandottes and Minorcas all jumbled together.

We thought you argued in favor of pure-bred stock?

So I do. This very flock of hens is a living argument in favor of better breeding.

What are you going to do about it?

Confess our sins and then get better hens. I hope to get eggs from well-known breeders of good stock. Then I want to select about 20 of our best hens, and cross them with good Wyandotte roosters. I like the White Wyandotte. I doubt whether Hope Farm is well suited to the poultry business on a large scale, as the land about the buildings is heavy and rather moist.

THE WEATHER.—We have certainly had an open Winter. February came in with a light fall of snow and a cold snap. On our hills the cold was not severe, but I heard reports of much colder weather in the valley. I thought this might be due to a difference in thermometers, so one morning I carried our thermometer along with me when I went to the train. It registered 13 degrees when I left home and gradually fell as I drove down hill, and at the railroad it stood at one above zero. That's what you get by living up in the air! Jack Frost went coasting that morning certainly. I was surprised to find such a difference in temperatures. This might occur on a still cold night, but it does not seem possible that windy weather could show anything like it. While the lighter sands in the valley can be worked in the Spring earlier than our heavy hillsides, Jack Frost attends to their case earlier in the Autumn and walks very slowly up the hills. We lose about 10 days in Spring and gain over two weeks in the Fall, and after some years at farming, I am convinced that the tail end of the season is freer from competition than the front end. The hills are good enough for us.

HOUSE CROPS.—The Madame's little brood is prospering this Winter. Our house is pretty well crowded, but the little folks find their way about. What a blessed thing it is for children to pass the early years of life on a farm! The boys had two little chests of tools at Christmas, and the objects they saw out and hammer together are certainly fearfully made. Grandmother teaches the little girls to sew, and with their school work their little hands and brains are kept busy. Life is reasonably "strenuous" for all hands at Hope Farm. Must be getting rich, eh? Well, hardly! There isn't much cash in our Winter's work, but we are starting one or two things which promise well. You can't take a farm and turn it into gold in a single year. It's a good thing you can't, or gold would become too common. Life in a farmhouse can be made dull and narrow enough, if one wills it so, yet great thoughts and true ideas of duty may flourish there, too. How should one try to live? I have had folks tell me that they worked and planned as though they expected to live forever, with no thought of death! Others say they live for to-day alone, with no thought for to-morrow. There you are!

NEAR TO NATURE.—Am I going on to give my views about that? I thank you—no! When I spoke of certain reflections made while sitting on that old stone wall, I stirred people up so that they haven't done coming at me yet. The following note was written by a Michigan man. I'll guarantee he has wandered off alone many a time to be refreshed and strengthened by the dumb sympathy of Nature. Just as our friend says, it is far better to have it out by yourself than to take it out of the family and make them all suffer—from the Madame down to the family cat:

"I take a lively interest in the Hope Farm man, and my sympathies have recently been enlisted in his behalf by the numerous criticisms, both just and unjust, which have been so lavishly bestowed upon him. I have sometimes felt in a critical mood myself, but just now I want to extend my hand in a brotherly grip, and that eternal stone wall is the foundation of this sympathetic demonstration. Now, I admire the man, who, when the clouds are hanging low (or had been, literally, in this particular case), can take himself off by himself and seek the solitude and comfort of Nature instead of laying the blame on his good wife, scolding the children, abusing the family horse or old cow, and raising Cain generally, as I imagine some of those pious critics have done at various forgotten times. I am aware that the Hope Farm man rather repudiates the idea that he had the blues, but the symptoms were certainly indicative of that affliction, and it is easy to find the cause of his ignorance.

"I suppose there is many a reader of THE R. N.-Y. who is having as hard or a harder struggle than H. W. C. Let me suggest the motto of a clerical friend: 'Do the best you can and then let 'er rip,' and if you do get the blues don't scatter them around the house or barn, but consign them to a stone wall, rail fence, or any old thing inanimate that is convenient, or write your troubles to THE R. N.-Y. and remember that 'Often for each other flows the sympathizing tear.'" S. D. P.

Amen! Amen! says the Hope Farm man. H. W. C.

JUST THE WAGON.

for your farm, whether it be wet, sandy or side hill. Circulars free. It will cost nothing to investigate. May be just what you need. We sell metal wheels for old wagons.

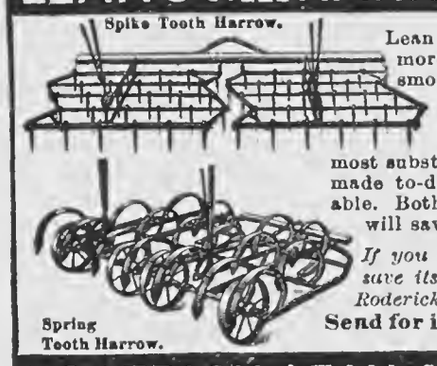
Free Wagon for R0999. Saginaw, Mich.

WINCHESTER
"NEW RIVAL"
FACTORY LOADED SHOTGUN SHELLS
No black powder shells on the market compare with the "NEW RIVAL" in uniformity and strong shooting qualities. Sure fire and waterproof. Get the genuine.
WINCHESTER REPEATING ARMS CO., New Haven, Conn.

LEAN'S ALL STEEL HARROWS AND LAND ROLLERS.



Lean harrows make fat harvests. They do more work and do it more efficiently than any other harrow. They tear up the ground, smooth it for sowing, harrow in the seed, kill the weeds after the crop comes up. The teeth are adjusted to suit any condition of the soil. By a touch of a lever they are instantly cleared of trash without stopping the team. The most substantial and finest finished farm implements made to-day. Made entirely of steel, light and durable. Both the spiked tooth and spring tooth harrow will save enough in a year to pay for itself.

If you want a Land Roller that will save its price in a single season, get a Roderick Lean Steel Land Roller.

Send for illustrated catalogue to-day.

RODERICK LEAN MFG. CO. MANSFIELD, OHIO.

PERFECT CULTIVATION

—the kind that means perfect crops, presumes the use of some implement which will thoroughly break up the top soil crust, thoroughly uprooting every weed, and admitting the light, air, warmth and moisture.

KEYSTONE Adjustable Weeder & Shallow Cultivator will do it every time, for all crops and on all soils. Can be expanded to cover a sweep of 7½ feet, or narrowed down to 30 inches to be used between the rows. They are not like other weeders—**they are better.** Works where the straight frame weeder is incapacitated. No cumbersome shafts. Runs steady. Strong, springy, pliable teeth. Blunt points for tender, sensitive plants. Flat teeth with diamond points for heavy clay soils, if desired. **Booklet on Weeders mailed free.**

We also make 10 styles **Corn Planters,** 12 styles **Cultivators,** 20 styles **Corn Shellers**—hand and power, **Harrows, Field Rollers, Feed Cutters,** etc. Write for new **Catalogue C.**

Keystone Farm Machine Co., 1547 N. Beaver St., York, Pa.

Iron Age Implements produce early crops and large profits. The reputation of **Iron Age** tools has been built during sixty-five years of fair dealing, and *you run no risk* in buying any farm and garden implements stamped *Iron Age* — SEED DRILLS, WHEEL HOES, RIDING CULTIVATORS, POTATO PLANTERS, HORSE HOES AND CULTIVATORS, etc. Get the *free Iron Age Book for 1901*—a beauty—and read about all the

IRON AGE
FARM AND GARDEN IMPLEMENTS.

The cut shows one of our new tools — the IRON AGE COMBINED FERTILIZER DISTRIBUTER, HILL AND DRILL SEEDER. It distributes fertilizer and sows the seed in drills or drops in hills; also distributes fertilizer alone to growing crops. It is strong, simple and light running. The results of its use are shown in large and early crops. The fertilizer can be regulated and placed exactly where desired.

BATEMAN MFG. CO., Box 102, GRENLOCH, N. J.

Ruralisms

NOTES FROM THE RURAL GROUNDS.

SCALE KILLING.—How to control the Pernicious or San José scale has become an absorbing question in the minds of all fruit growers. It is realized that the pest is now widely distributed, and intrenched beyond all possibility of general dislodgment. The researches of the experiment stations have thrown much light on its life history, and a practical method of controlling its ravages seems to have been worked out in the use of petroleum. Just how to use this powerful agent, in view of conflicting reports of its action on living trees, is the vexed problem. J. H. E., Lewistown, Idaho, writes as follows:

In Rurallsms, December 29, it is stated that in early Mareh the trees now infeeted with the scale will be closely pruned and given two thorough sprayings with crude fresh petroleum, just as the buds show signs of starting. Now, for the benefit of some of your western readers, who are contemplating the use of crude petroleum for a like purpose, will you answer a few Inqulries in reference to the use of the petroleum? You mentlon using fresh erude petroleum. Does it lose in effieiency with age? Do you apply full strength, or as an emulsion? Is it applied warm or eold? If eold, is it not difficult to apply as a fine spray? What make of nozzle do you use? I observe in the same issue, page 873, in report of Ohlo State Hortieultural Soeiety, Prof. Webster, of the Ohlo Station, states in his report that "crude petroleum is indeed a dangerous weapon to use against it. It seems we have much to learn before we ean safely use it." I have read that when pure eoal oil is used for the same purpose, it should only be applied in clear weather. Might it not be the same in the use of the crude petroleum? If the sun were shlning the more volatlle parts would pass off more readily, and not penetrate so deeply lnto the bark.

SPREAD ALL OVER.—By "fresh" petroleum we mean the freshest we can get in the local hardware store, securing it, if possible, from a newly-received barrel or package. Two sprayings will be given in order to cover any areas left untreated by the first application. It has been demonstrated that petrolcum does not spread on the trunk or branches of a tree much beyond the area of its application, even during the hottest weather. A spot or strip of untreated surface, if sheltering live scales at the time of spraying, will continue to afford congenial lodgement and breeding conditions for the young, but the larvæ apparently find it impossible to effect a lodgement on the adjacent greasy area, and the treated portions have thus shown themselves to be immune to attacks of the scale until the end of the season, eight months at least. Untreated areas are easily seen a few hours after spraying, as the effect of the petroleum is to tinge the bark a blackish-brown, which persists until the storms of the succeeding Winter, when the color bleaches out to a rather light gray. A fair application of petroleum certainly kills every scale which it covers, and undoubtedly destroys many fungi, and insects other than the scale.

MAY KILL TREES.—It has killed many young trees also, and seems to be especially fatal when applied in midwinter to dormant trees. For this reason we prefer to spray in early April, just as the buds begin to swell, as the bark, being full of sap, is less easily penctrated by the light volatile oils contained in the crude or natural petroleum, and the activity of growth at that period quickly repairs any moderate injury to the living cells of the cambium, which might perish if exposed for months to the cold, dessicating winds of Winter. For the few trees treated on the Rural Grounds an ordinary greenhouse spraying bellows has proven efficient. The coming season we shall usc a Leggett churn sprayer, the nozzle of which is a modification of the Vermorel.

WHEN TO SPRAY.—Petroleum at temperatures above 50 degrees is very easy to spray from any nozzle, but it thickens and becomes difficult to handle at low temperatures. We would choose a bright "drying" day when possible, so that evaporation of the volatile constituents may be as rapid as possible. The actual destruction of the scales probably takes place very quickly, and the sooner the volatile oils are dissipated the less injury to the tree. Crude pctroleum, as pumped from the wells and marketed, is of uncertain and varying composition; the product from one district differing from another. When kept for a long time it becomes dark and heavy from the escape of the benzine, gasoline and kerosene oils and the concentrated vaseline, paraffin and heavy oils remaining are too greasy and choking in their effect for safe application to living trees. It is likely that experiments will be made to determine the safest and most effective combination, and it is possible that the petroleum insecticide of the future will be built up to a definite standard by synthesis, or putting the ingredients together. Our applications are made in full strength. There is always an element of uncertainty in an emulsion. It is troublesome to make, and very unstable, unless used immediately.

CANNAS AND PENNISETUM.—Fig. 38, from a cut kindly loaned by the Florists' Review, Chicago, Ill., shows a delightful bedding effect produced by two easily-grown plants. Cannas have now become so cheap that a dozen roots or plants may be procured for a trifle, and bedded out as soon as the soil becomes warm in a rich compost. The Pennisetum is sold under the name of Purple Fountain grass, P. Ruppelianum, and enough seeds can be had in a 10-cent packet to plant quite a border. They should be sown indoors about March 1, and the little plants transplanted two inches apart in shallow boxes of light soil and kept rather moist. They are quite hardy, and may be set out before it is safe to plant the Cannas. Place the Cannas 18 to 20 inches apart through the center of the beds, and the Fountain grass not over 10 inches apart around the border. The combination of silvery purple of the grass plumes with the dark green foliage and glowing red and yellow blooms of the Cannas is very pleasing. Purple or dark foliaged Cannas should not be used in this combination.

PLANTING GLADIOLI.—Village Smith, of Ohio, asks the following questions:

Do you know of anyone using a hand drill for planting Gladiolus bulblets? If so, what make was it? I have tried the Planet Jr., but it does not plant them thick enough; that is, the largest bulblets; it might work on the very small size, as they ean be sized by running through different sereens; a good hand drill would be a great labor saver if it would do the work properly, where one has about 300,000 bulblets to plant. How deep, how thick, how far apart the rows? How do you plant your bulblets?

We have never seen a drill used in planting the bulblets or cormels of Gladioli. They are assorted in two or three sizes by sieves, and scattered in a broad furrow, at least four inches wide at bottom, by hand. They may be sown at the rate of 50 to 100 per foot of furrow, and covered with three or four inches of mellow soil. This seems very thick planting, but experience has shown they grow much better than if strung out to greater length of row. It is well to plant only in freshly-made furrows, as the dry little cormels need all the moisture they can get to soften the hard shells. We plant in rows three feet apart, and cultivate entirely with a wheel hoe, but a small-toothed horse cultivator may be used to advantage.

W. V. F.

A NEW STRAWBERRY.—Among the new candidates for favor among strawberry seedlings is "Marie," which we understand is being offered by W. N. Scarff, of Ohio. Mr. Scarff tells us that Marie is one of a lot of seedlings grown in 1892 from seed of Crescent fertilized with Cumberland. Mr. Searff thinks that if you can get a berry that will give the yield of Crescent, with as large and fine fruit as Cumberland, you will reach near to the ideal in the coming strawberry. He gives the following description of this new berry, and we show at Flg. 39, page 103, a quart of the fruit as actually packed ready for shipment. We have not yet tested the variety. "Marie was grown from seed of Creseent fertilized with Cumberland in 1892. As a seedling it showed great promise. We planted for field eulture as soon as sufficient number of plants was obtained, and as yet have failed to deteet any weak points in either fruit or plant of this grand variety. The plants are good growers, making plenty of runners for a good crop and show no signs of disease. The blossom is imperfeet; season same as Bubaeh and Haverland. Equally as large as Bubach, Glen Mary or Brandywine, and yielding with any variety in our 40-acre fruit plantation; besides, it is the most attractive in appearance when picked and ready for market of any in our entire collection. The berries are round as a ball, dark crimson in eolor; flesh dark and quality first-class, holding up in size to the very last pickings."

THE experiment started a year ago by the Rhode Island Experiment Station to determine the result of individual selection of strawberry plants will be watched with considerable interest. Such a thing is very properly station work, for the market grower would find it a matter of much care, particularly with the method of matted row culture. J. W. B.

Everblooming Hardy Roses.

I grow them. Don't bother with little mail-size plants. Get strong three-year old field-grown BUSHES—vigorous and hardy! I have them. Try this half dozen—all perpetual bloomers: Mrs. John Laing, soft pink; Anna Diesbach, bright rose; Coquette des Alpes, finest white; Gen. Jacqueminot, crimson scarlet; Baron Bonstettin, dark velvet; Paul Neyron, largest and finest of all. Too heavy to go by mail. Big, strong bushes that will bloom profusely the first season. By express, prepaid, $2. Order to-day.

Live Stock and Dairy

THE BREEDERS' WAYSIDE.

What Breed Shall I Use?

A subscriber of THE R. N.-Y. up at Buchanan, Mich., simply fires a volley of questions at "some of the stock growers and breeders of cattle," o be answered through this paper. The undersigned will answer this letter in part now, and the rest later, and trusts that "some of the stock growers and breeders of cattle" will also answer the question brought out. A. R. H. says he has an ordinary farm herd, and would like to get a young bull to breed from, *so as to raise steers for beef*, that will bring top prices, *and to raise cows that can be sold for good milkers.* He wishes good-sized, quiet, gentle cattle, and prefers a mulley or hornless breed. Then he says: "How do the Short-horns compare with the Holsteins in milking qualities, and how do Holsteins compare with Short-horns in size and as beefers? Is there any strain of either of these that are mulleys? How do the Red Polled cattle compare with those mentioned?" Then he further says he would like to know what the good and bad qualities are of the different breeds that might suit his purpose, and how he could get a young bull without pay an exorbitant price, such as some breeders ask.

There are some things in a recent number of THE R. N.-Y. on improving a herd, that I should like to have our friend read over, for it has an application in this case. The breed question is not nearly so complicated as we are likely to think. One may be mighty sure of one thing, and that is, when a breed becomes abundant and common, it certainly possesses merits justifying its adoption, under favorable conditions. Consequently, the man who wishes to establish a type as shown in a breed, should do two things. First, he should read up on the merits and demerits of the several breeds of the general character he desires. Second, it will be time and money well spent to find out who breeds within reasonable distance from his home and go to see their stock and get such information as may be possible at these places. There are creditable herds of the different prominent breeds in nearly every State in the Union east of Nebraska and north of the Ohio River. As this farm herd is in Michigan, the chances are that it represents more Short-horn blood therein than anything else. There are strains of Short-horns, that come from milking stock, and there are purebred mulley Short-horns, and also Polled Durhams which are practically Short-horns. Logically, if his herd is largely of grade Short-horn blood, then the use of mulley purebred Shorthorn or Polled Durham bulls would be the proper thing. One thus might plan on good steers from such stock, assuming the bull used to be a good one. No other beef breed has more strength in milking, than has the Short-horn.

If a comparison is made with Holstein-Friesians, we find what is undoubtedly the heaviest milking breed in the world. The world's milk record is held by a Holstein, and there are many cows on record, of this breed, that produce 12,000 or more pounds of milk a year. However, this is not a breed that I should recommend for beef production compared with most of the other prominent breeds. The Holstein's great virtue lies in its milking capacity, and Holstein steers will not usually sell on the market for the highest prices, neither will they produce as high a grade of meat as the best market demands. None of the strictly dairy breeds will. They will not kill out as profitably to the buyer as the thicker-fleshed sorts, and that is why they bring the lower grade price. Holsteins weigh heavy enough, but they carry more offal than does the closer-bodied beef type .Holstein grade milkers, however, with first-class udders, should sell very well on the market near large towns, or in a creamery district, where milk is in strong demand. But if one is to take into account the combined values of steers and milking cows, I favor the Short-horn over the Holstein grades, as the more profitable of the two, for good grade Short-horn cows should be equally salable with Holstein cows, with the further advantage lying with the Short-horn steer.

The Red Polled breed is not extensively bred by farmers in America. Its merits, however, are great. It represents a general-purpose sort, for many Red Polled cows are very superior producers of high-class milk. The promoters of this breed have long advocated it for an all-'round type, to produce plenty of milk and make high-class beef. In the show ring, in dairy tests, and in the stable Red Polls have made excellent records. They lack the weight of Short-horns, and milk much the same in quantity as the better class of these, and in beef have ranked high. Steers from a Red Polled sire of size and quality, and good grade cows, should feed and sell well, while females from such mating, if well uddered, should be in good demand. The Red Poll grade steer, however, will probably not feed as fast or profitably as the more highly-developed Short-horn type, but the average Red Poll cow will be a better milker than the other. If I were to compare these three in relative order of merit, in profitable production, taking average specimens of each breed in high grade form, for beef, I should class them as first, Short-horn, second Red Poll, third Holstein; for milk, first Holstein, second Red Poll, third Short-horn. I have tried to make a fair statement relative to each breed. Each has its merits. No one is perfect. Local circumstances should influence one in what is used for grading up the herd. In any event, however, buy a first-class bull, of pure blood. First find the sort of animal you want, and then talk price. There are different opinions as to what is an exorbitant price. Yet that is not to be measured by one season of service. The get of a bull may be kept in the herd and affect the entire development up or down for years to come. That being so, one can hardly afford to let a comparatively small sum of money stand in the way of purchasing what is apparently the right sort of an animal. There is something more at stake than making a fresh cow, as some men figure. It is the uplifting or letting down of the character of our American herds, which, of course, means more profit or less profit, more credit in our possessions or less credit. Now, "what breed shall I use?" Every man must work out his own salvation on that question. But, if he is a keen student of animal life, and is capable of bringing out the best there is in his herd, and is with all sincerely interested in his work, he will probably succeed, no matter what herd he decides on. But if he lacks these then no breed will bring him success.

C. S PLUMB.

When to Ring a Bull.

I have noticed several articles at different times in THE R. N.-Y. on dishorning young calves with caustic. I have dishorned two calves successfully that way, and I expect to try it again next Spring on a bull calf. I wish to learn whether there would be any harm at that time in putting a ring in his nose? It seems as though it would be much easier than to wait a year, as many people do. C. L. B.

Saratoga Co., N. Y.

The placing of a ring in the nose of a young bull is often delayed until he reaches a size and disposition that require severe measures for control. Personally, I prefer to delay ringing a calf because the ring is no ornament, and it may be used before necessary, and unintentionally cause pain that may irritate and injure the disposition. Our bulls, as a rule, have rings placed in the nose at about 10 or 12 months of age. The nervous disposition of a dairy bull would perhaps require control measures quicker than the beef type. However, if one wished to there could be no special injury other than I have indicated, no matter what the age, although for looks' sake if for no other, don't hurry putting in the iron.

C. S. PLUMB.

Not one half the patients supposed to be suffering from Consumption really have that distressing disease—though ofttimes the symptoms from which they are suffering lead to it. Nearly every case of this kind Dr. D. Jayne's Expectorant would cure.—*Adv.*

Horse Owners! Use GOMBAULT'S Caustic Balsam

A Safe Speedy and Positive Cure

The Safest, Best BLISTER ever used. Takes the place of all liniments for mild or severe action. Removes Bunches or Blemishes from Horses and Cattle. SUPERSEDES ALL CAUTERY OR FIRING. *Impossible to produce scar or blemish.*

Every bottle sold is warranted to give satisfaction Price **$1.50** per bottle. Sold by druggists, or sent by express, **charges paid**, with full directions for its use. Send for descriptive circulars.

SOLUBLE LIVE STOCK SCIENCE.

What is Protein and Carbohydrate?

As regards food for cows, what is meant by "protein?" I look in the Standard Dictionary and, after getting the meaning of the word, I am as ignorant as ever. I assume it means the quality of food that will produce the most milk. Am I correct? Also carbohydrates; if a man is versed in chemistry these words may appear familiar, but I submit, if the average reader of your paper is supposed to know their meaning. I am not an ignorant person, and what farming I do is more for pleasure than profit, but take the average farmer who has never known anything but farming, and simply knows how to read and write; is he supposed to know the meaning of such words? Would it not be well to supply the meaning of such words as you publish an article, so we can read intelligently? READER.

The chemist and the cow find four groups or classes of substances in grains and fodders. Take, for example, a pound of wheat bran. Burn this bran so that every part of it that is combustible is burned up. There will be left about one ounce of ash, which represents the minerals. Now if we burn an animal weighing 500 pounds so completely that nothing is left that will burn or evaporate, we shall have about 40 pounds of ash, chiefly from the bones. The bones in the animal system can be built or renewed only by these ash elements in the food. The other parts of the food are of no value in bone-building. Young animals with growing frames require more of the ash elements than older ones. A failure to supply the ash elements in the food results in disease. Young stock fail to grow and thrive. Cows deprived of the necessary elements develop abnormal tastes. They will chew bones when they find them, drink filthy water, or eat disgusting food, or gnaw fences or other boards.

THE PROTEIN.—The muscles and tissues of the animal contain nitrogen, and in order to build new tissue, and to restore the wastes caused by work, food containing nitrogen must be supplied. The chemist, in picking apart a pound of bran, will find a class of substances containing nitrogen. There will be something over two ounces in the pound of these different substances, all of which are grouped under the name of protein or proteids. A simple name for this group of substances would be muscle-makers, since they are used for the production chiefly of muscular tissue. Unless this protein is present in the food, in proper quantities, the animal suffers, for it cannot replace the waste of muscular tissue, and in the case of the growing animal it cannot make new growth of fiber. In the case of the cow an extra quantity of protein is necessary, because the milk contains about as much of the protein as it does of butter fat, and unless this is supplied in excess of the demand made by the cow's system, she cannot give a large quantity of milk. The protein cannot be used to make bone. The ash elements alone can do that, but it is absolutely necessary for growth, for work, or the production of milk.

CARBOHYDRATES.—Continuing his investigations the chemist would find in a pound of bran nearly seven ounces of various substances like starch or sugar, which do not contain nitrogen. They differ from the protein chiefly in this respect. These substances are grouped together under the name of carbohydrates. A simpler name for them is fat-formers, because the formation of fat in the body is one of their chief uses. These carbohydrates are not used in making the bones or in making muscular tissue. From them the fat in the body may be produced, and they also serve as fuel. We all understand that in the living body there is constantly going on a combustion not unlike that which takes place with much greater fierceness in the stove which supplies our houses with heat. This combustion of the carbohydrates keeps up the animal heat, and really supplies "living steam" for the body. If the carbohydrates are not present in sufficient quantity the animal loses flesh, and lives for a while on the fat previously stored up in the body; there being little fuel in the food, the animal fires run down, and, of course, the animal suffers.

PURE FAT.—Chemists will also find nearly half an ounce of what is known as pure fat or oil in the pound of bran. This differs from the carbohydrates in the fact that it is a clear, pure fat, while the carbohydrates are the materials from which such fat is made in the body. All foods therefore contain these four distinct principles, each having its special purpose in the animal economy. The ash elements must be present or the bones will suffer, especially in the young and growing animals. The protein must be present, or the animal cannot maintain its strength. It will lose its vigor, and the cow, in particular, cannot give a large yield of milk. The food must contain carbohydrates in order to supply the necessary fat on the body, and provide fuel for the animal heat. The pure fat is not so absolutely necessary as are the other elements, yet a fair proportion of this fat should be present in every ration.

WHAT OF IT?—The ordinary farmer may ask: "Of what value to me is all this?" It can be made of great value to any man who feeds a single animal. After much experiment and study, the scientific men have decided that the proper ration for a cow giving milk should be divided so as to contain for each day's feeding about 2½ pounds of the protein, 12 pounds of the carbohydrates, and half a pound pure fat. The science of feeding consists in mixing our grains and fodder in such a way that this proportion of these elements will hold good. For example, a man not knowing anything about this matter might feed his stock largely on corn, corn fodder and Timothy hay. In order to obtain the necessary protein, to produce milk, muscle and growth, he would have to feed extra quantities of this ration, while by substituting wheat bran or linseed meal for a part of the corn, he could feed less of the hay, and save money by doing so. He would learn by studying the analyses of foods that his mixture of corn fodder and hay might answer well for fattening steers, but was not economical for feeding dairy cows. The chemist has picked apart all the well-known feeds and fodders, and with tables showing their analyses it is possible to put them together so as to give the proper balance of protein and carbohydrates in an economical way. For example, the following table shows the analyses of a few leading articles of cow feed:

	Pounds in 100. Muscle makers.	Fat formers.	Pure fat.	Ash.
Wheat bran	12	40	3	5
Corn	8½	60	4¾	1½
Oats	9	44	4¾	2¾
Mixed hay	3½	43	1	4¾
Clover	7¾	40	1½	6
Silage	1 1-5	12	½	1
Skim-milk	3½	5	¾	¾

These figures represent the digestible substances—that is, the proportion of them which a healthy animal may be expected to utilize. Making a "balanced ration" is not a mere matter of arithmetic, however. Wheat bran, linseed meal and silage have a laxative effect on the system, while cornmeal, clover hay, buckwheat and other foods have the opposite effect. It will be noticed that wheat bran and clover are very rich in ash elements. That is one reason why they are excellent for young animals.

Lice on Cattle.

What remedies may be used safely to relieve cattle infested with lice? SUBSCRIBER.

Rub the regions infested with the lice (most commonly the neck and shoulders) with one part kerosene well shaken up in about eight parts of sweet oil or cotton-seed oil. Repeat the application in a week or 10 days. Two or three applications, if thorough, ought to rid the cattle of most of their lice. The stable should be cleaned and scrubbed with kerosene and water, or whitewashed. During warm weather it would be easier and equally effective to use one part kerosene to eight parts water, or one part kerosene emulsion dissolved in eight parts water, and sponge the animals all over thoroughly.

Garlic Taste in Milk.

On page 92 reference is made to a powder which is to be fed in the cow's grain to prevent bad taste and odors in milk. Is it possible that these odors can be prevented in this way? READER.

We can see no reasonable grounds for the claim made, that a substance fed to cows would have any effect upon destroying the garlicky odor of milk. The flavors of foods, as a rule, are due to essential oils, and organic acids, which when taken into the stomach are absorbed by the system, and penetrate to every part of it. Hence the addition of any substance would not expel this completely, at any rate after the food was in the stomach. It might serve in part to carry off the gases, but that would not affect their complete removal.

THE MOST FOR THE MONEY.

The Improved United States Separator

Continues to Excel the DeLaval in Wisconsin the Same as it Does in the Other States.

NORTH FREEDOM, WIS., Jan. 21st, 1901.

A few weeks ago I decided to purchase a cream separator for use upon my farm. I had heard both the United States and the DeLaval machines highly recommended, so I decided to try both before buying. * * *

Friday, Jan. 18th, all hands were present, the DeLaval Local Agents and also the State Agent, while the U. S. man was alone and a stranger in the crowd.

The DeLaval Agents had laid considerable stress upon the fact that their machine could do much better work than the U. S., and especially when skimming cold milk at a temperature of 68 degrees, or when running at low speed; so we decided to test the machines on these points, as well as on milk at normal temperature. The following is the result of these tests:

Test No. 1. Normal Temperature. Regular Speed.

Separator,	Actual capacity.	Speed.	Temperature.	Cream Test.	Skimmilk Test.
U. S. No. 5	450 lbs.	50	80°	36%	.025
Alpha No. 2	405 lbs.	45	85°	27%	.04

Test No. 2. Normal Temperature. Low Speed.

U. S. No. 5	450 lbs.	42	88°	36%	.04
Alpha No. 2	405 lbs.	38	86°	27%	.05

Test No. 3. Cold Milk. Regular Speed.

U. S. No. 5	450 lbs.	50	68°	30%	.05
Alpha No. 2	405 lbs.	45	78°	22½%	.05

The machines used were both $125.00 machines, therefore the results speak for themselves. The U. S., with all the conditions against it, running a much larger capacity and a much heavier cream, and in the first test with the milk 5° colder than the Baby, proved superior in every test.

A great victory for the U. S., especially so as the test was run according to the wishes of the DeLaval representative. J. T. DONAGHEY.

Prospective buyers can draw but one conclusion from the above, namely:

THE BEST SEPARATOR ON THE MARKET IN EVERY SENSE OF THE WORD IS

The Improved United States Cream Separator

VERMONT FARM MACHINE CO., BELLOWS FALLS, VT.

The Chicken Yard.

THE VALUE OF GAME POULTRY.

We find the classes devoted to Game birds well filled at most exhibitions. For what purpose are these birds used? Are they valuable enough for eggs and meat to suit the needs of the farmer?

Indian Games are business birds. All surplus males are easily sold to market poultry raisers to increase both the quality and size of the chicks. An Indian Game male crossed with a flock of common hens will increase the size of chick easily one pound each, and besides, the appearance is very much better with the bright yellow skin and full, plump breast. The fighting Games I do not know much about. I have bred a small pen of Pit Games for the last three years, but do not find much demand for them; occasionally sell a male bird, but very few for fighting, although I seldom know what is done with them after they leave here. D. A. MOUNT.

New Jersey.

I can only answer regarding the standard Game, the pit bird I have never bred, and know nothing about. In the first place the Game as a table fowl is second to none; secondly, there is not a breed of fowls to-day of the sitting varieties that is superior to them as layers; thirdly, there is no variety of fowl known that is more hardy, and a better fowl to raise where they can have unlimited range; they are equally as good where confined in limited quarters. They are the most aristocratic in bearing and appearance of any fowl known; I can compare them with other fowls only by saying they have the same bearing toward other breeds that the finest American-bred trotter has as compared with the clumsy, cold-blooded Percheron horse with his sluggish nature. They are the finest-colored in plumage of any breed we have. This is my opinion of the standard Game, after having bred them and many other varieties of fowls for a number of years. I have nothing in my yard now but the standard Games, and have two different varieties, the B. B. Red and Red Pile. We all know that the Game is the oldest known domestic fowl in existence to-day. W. L. RACE.

Waterville, N. Y.

To Destroy Head Lice.

I have a flock of 150 pullets that are troubled with head lice, though not badly infested. The lice seem to be of a smaller variety than those that are found on little chicks. The flock is in good condition, and laying fairly well for the season. Can the lice be exterminated, and how? H. P. G.

Stratham, N. H.

Anoint their heads with equal parts of coal oil and lard, or coal oil may be used alone if carefully applied. It is instant death to all lice that come in contact with it, but if used too freely it will blister the fowls. Sulphur, tobacco dust, or any kind of very fine dust, will help rid fowls of the pests, but not so quickly and surely as will coal oil. J. E. S.

Care of an Incubator.

Will F. E. W. tell us whether she finds a ventilated cellar the best location for an incubator? How about turning and cooling eggs in such a damp, cold place? How long may chicks be safely left in the machine after hatching? E. A. C.

Cleveland, O.

Most incubators in the early part of the season can be run best in a room on the first or second floor, convenient to the operator. The changes of temperature at this time are not very great, and the fresh, sweet air of a sunny room is good for the young birds. Later on, when we have cool nights, hot, dry middays, a clean, ventilated cellar is best, as the changes in temperature are much less. It does not injure eggs to turn them in a cold room if the incubator is kept warm to receive them (as a hen would be on returning to her nest). The length of cooling must depend on the thermometer, which should not fall below 80 degrees. The hatch should be over for chicks on the twenty-first day. The trays may then be taken out and cleaned up. The chicks should be left in the machine till the close of the twenty-third day, the temperature being same as during early part of hatch. They are not to be fed or watered till placed in the brooder. F. E. W.

Wanted! More Pullets.

I am raising poultry for eggs, mostly Leghorns. Last Spring I raised 400, of which 300 were cockerels. Can you advise me how to hatch out more pullets? I use an incubator and feed chickens corn, bran, beef and bone, also green feed. R. S.

Long Island.

I think if you will increase the number of cocks in your breeding flock that Nature will maintain the equilibrium by furnishing the hatches with more pullets. It is claimed by some of the old-country poultrymen that eggs which show only an infinitesimal air space will produce cockerels; if tested out, the cockerels hatched will be very largely in the minority and the pullets greatly in excess. W.

Another Crowing Hen.

I have a short chapter to add to the history of the crowing hen. We have one, of some seven Summers, that is a cracker-jack. She is white in color, of mixed blood, and is kept both for pleasure and profit, and I am certain she lays more eggs in a year than any one of her relatives or descendants. She was two or three years old when we first noticed her propensity for crowing. We had no rooster at the time, and I suppose she felt called upon to supply the deficiency, being then the oldest member of the family, because of her honorable record as a layer and sitter. She then had spurs about an inch in length, they are now two inches long. I think her eggs are fertile, as we have had several hens since she commenced her career, who have been crowers, presumably her offspring. Her usual method of business is first to cackle, then lay an egg, cackle some more, and finish by flying on to the fence flapping her wings and crowing. Another eccentricity of this biddy is a habit of moulting in midwinter in a very independent way all by herself, and very thoroughly, shockingly so. S. D. P.

Greenville, Mich.

WEIGHT AND MEASURE IN FEEDING.

In institute work, in advising the use of coarse wheat bran in place of other wheat feeds, and the use of gluten feeds and meals in place of cornmeal or hominy chop, we always run against the farmer who says he can get more milk out of middlings and the bran that is full of flour rather than coarse bran. "Analysis doesn't trouble him! He is after results," and the same man can get twice as much milk out of cornmeal as wheat bran. When we question this farmer we almost unvariably find that he doesn't weigh his milk; he guesses at results. He also does an equal amount of guessing in his feeding. Ask him how many pounds of the different grains he feeds his cow, and he is equally up the stump. We find that he feeds by measure rather than by weight, and the large majority of farmers are just like him. They use a two or four-quart measure or basin when feeding, and when using different feeds they always compare measure, not weight. We have prepared a table to show such men that they ought to compare feeds by weight rather than by measure, as grains and feeds are all sold by weight. This table is an eye-opener to the man who has never given the matter any thought. We give some of it here:

Weight, one quart each.	lbs.
Coarse wheat bran	0.5
Coarse wheat middlings	0.8
Fine wheat middlings	1.1
Wheat, mixed feed	0.6
Gluten feed	1.2
Gluten meal	1.7
Cotton-seed meal	1.5
Corn meal	1.5
Linseed meal	1.1

When we examine the table we find why the farmer who feeds by measure gets such good results from fine floury middlings, and says coarse bran is no good. The farmer who feeds his cows four quarts of middlings twice a day is giving them nearly nine pounds of grain as compared with four pounds of coarse bran. If he adds to this two quarts of cornmeal each time he also gives them six pounds more of grain, while if he fed four quarts of gluten feed he would feed less than five pounds. The man who in picking up a sample of bran looks for lots of flour doesn't realize that he is buying starchy material that he can or does raise largely on his own farm.

Eight quarts of middlings and four quarts of cornmeal will weigh 14.8 pounds, and will furnish 1.5 pounds of digestible protein. Eight quarts of coarse bran and four quarts of gluten feed will weigh only 8.8 pounds, but will also furnish 1.5 pound digestible protein. The middlings and meal will cost about 15 cents, while the bran and gluten feed will only cost 8½ cents. We find lots of farmers feeding cornmeal, which is low in digestible protein, but is heavy. They cannot give a sensible reason why they feed it, only they always have. They don't know what it costs to produce a quart of milk, and often I am afraid they would rather not know. If they would study cost of milk, then study feeds and their digestible protein analysis, then feed using weight rather than measure as a basis, there might not be so much kicking against farming. H. G. MANCHESTER.

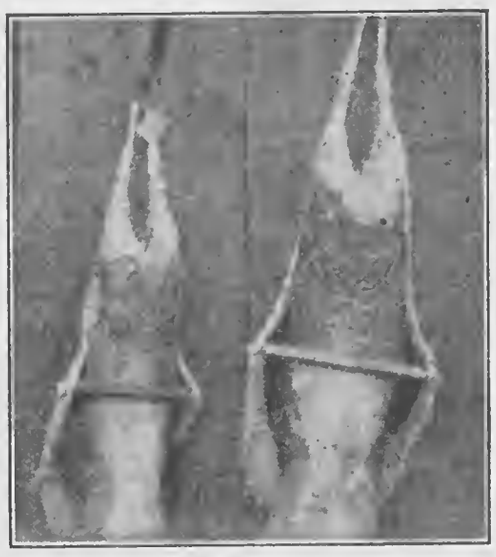
THE TUNIS BREED OF SHEEP.

Compared With the Dorsets.

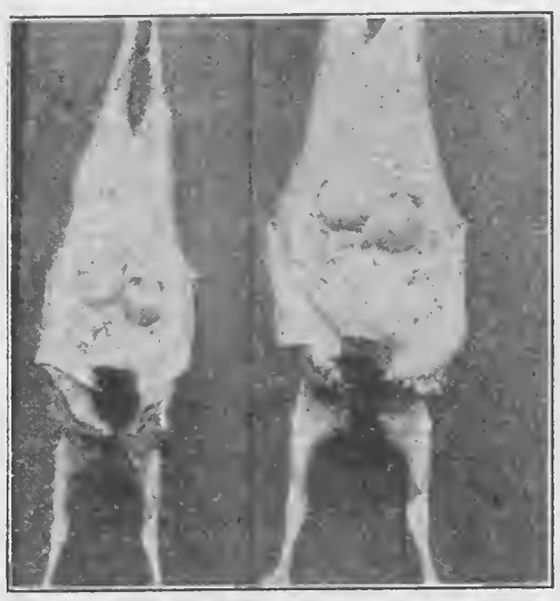
On page 78 Clark Allis, of Medina, N. Y., had a short note about his experience with Tunis sheep. On January 24 I went out to Mr. Allis's farm to see these sheep and their lambs. To one who has never seen a "lambery" the business of producing these woolly babies is very interesting. I am not going to try to tell how the business is done, for every visit I make to an expert in any line makes the fact clearer that high-grade success cannot be passed from one man to another on paper. It must, first of all, be in the man himself, and the man



BACK VIEW OF TUNIS LAMBS. FIG. 41.

must have the patience and industry needed to work it out.

Of course the most important thing about a "lambery" is to have the lambs born early, so that they may come to marketable size early in the Winter. Grades of the Dorset breed of sheep have been noted for this early habit. When Dorset rams are turned in with the ewes early in the Summer the chances are better that the lambs will begin to come early than would be the case with most other breeds. The great majority of the very early lambs which bring $9, $10 or $12 each have, I think, been Dorset grades—in fact, the Christmas lamb usually carries the Dorset trade marks. Mr. Allis says that he tried all breeds of mutton sheep that gave any promise of earliness, and finally became a "Dorset man"—that is, the Dorsets proved most profitable for his business. He finally heard of the Tunis breed. These sheep come from the north of Africa, and there are comparatively few of them in this country. It was claimed that their wool is of very superior quality and that they are precocious breeders. They belong to the race or family of fat-tailed sheep—the tail being broad and fat, and run-



HOW THE TUNIS DRESS. FIG. 42.

ning high up to the back. There is another family of fat-tailed sheep found in Siberia and Persia. During the Summer, when feed is abundant, the tail grows to a large size—a great mass of solid fat. In Winter, when food is scarce and the weather is cold, these Siberian sheep actually live partly on the fat stored up in the great tail, which is largely absorbed away.

Mr. Allis had no desire to make his sheep live on their tails, for the inmates of a lambery have grain before them all the time, but if there was anything that would give earlier, stronger, plumper or larger lambs than the Dorsets, he wanted to give them a chance. He bought a small flock of Tunis and turned the ram, with a Dorset ram, in with his flock of ewes. The Tunis ram would not fight, and the Dorset was easily the master, yet the majority of the earliest lambs were Tunis grades. Mr. Allis says that about the middle of last Summer he would have sold his Tunis for a song, and a poor tune at that. Their good qualities were not apparent. Since the lambs came, and especially since they were sold, he says he would not sell a single Tunis. He says he gave both breeds a fair chance, and gives the palm to the Tunis for good reasons. He was prejudiced in favor of Dorsets, and has no Tunis for sale.

1. A majority of the grade lambs showed Tunis blood, especially among the earlier ones.

2. The Tunis grades were stronger and plumper than those with Dorset blood. That was certainly true of those I saw, which were of about equal size.

3. The Tunis lambs sold, as a rule, for more money. The commission men and customers picked them out as best. I saw bills, commission returns and letters which show this. The fat tail of the little Tunis grades, instead of being an objection, was considered a delicacy, and added to the value of the carcass.

I do not wish to start any "boom" for the Tunis sheep. When the Dorsets began to show their value we did our best to make people acquainted with them.

HAPPY LITTLE STRANGERS. FIG. 43.

Mr. Allis has been raising early lambs for several years, and he gets the highest prices. I give his experience without argument. There are not many registered Tunis in the country. The danger of a "boom" is that a lot of poor scrubs or grades will be brought here by unscrupulous rascals and sold as pure Tunis. The trade in Dorsets was badly injured by just such methods.

The pictures show sheep and lambs at the Allis farm. Figs. 41 and 42 show how the Tunis grades dress, back and front. Fig. 43 shows the characteristic shape and color of the little Tunis as compared with Dorsets. Red or red and white is the Tunis color. Other Tunis lambs are shown at Fig. 44. The little fellow shown at Fig. 45 has deceived the old ewe. The red lamb died, but his skin was taken off, and put on a white one, and the fond and foolish sheep at once adopted the little stranger. H. W. C.

LEAVES AND HOGS.—Regarding your leaf-gathering enterprise, when we gathered leaves we made work of it in this way: Men and boys went to woods with wooden rakes, at odd times, and raked leaves in big heaps; if the weather was damp took team and wagon with double box, and loaded leaves right into wagon with oat forks. One man was in box to pack down leaves. If dry, leaves lay in heaps until a convenient time and damp day came. A load of leaves made a big pile when thrown into the pigpen, and how the porkers did enjoy working them over for acorns, pieces of decaying wood, etc. There was no play about this, but we secured the leaves by scores of loads. The underbrush was cleared out by working the same ground over year after year. The resultant fertilizer removed from the hogpen in the Spring more than paid for the work.

New Jersey. D. E. R.

FOR CHILDREN

Nothing, that comes in a bottle, is more important for children than Scott's emulsion of cod-liver oil.

And "important" means that it keeps them in even health. Whenever they show the least disturbance of even balance of health, it promptly restores them.

It is to be used as a food, whenever their usual food does not quite answer the purpose of food.

We'll send you a little to try, if you like.

A. B. FARQUHAR CO., Ltd., York, Pa.

Ailing Animals.

ANSWERS BY DR. F. L. KILBORNE.

It May Be Tuberculosis.

We have a cow—our best save one—that has not been well for several months. She is poor in flesh, though possibly improving a little under very careful feeding. Her mess of milk holds out nicely—11 to 12 pounds per day. She is farrow. The better feeding increases the flow of milk. She sometimes makes a noise in breathing, and has at times a slight cough. The opinion of those who have looked at her seems to be that there is some trouble with the glands of the mouth, and once there was a slight swelling apparently just back of and under the jaw on right side. There is often an offensive odor from the breath, and I am not sure but there is a similar odor from the manure. It has been once suggested that there is tuberculosis, but from reading station bulletins, I hardly think so. Do you think it is a trouble with the salivary glands? What shall I do for the case? L. H.

New York.

The throat trouble you describe is very suggestive of tuberculosis of some of the glands of the throat. Such symptoms might, however, be due to a tumor or diseased growth, or to some other disease of the gland. I would advise having the cow examined by a competent veterinarian, and if the cause of the trouble cannot be otherwise ascertained, apply the tuberculin test for tuberculosis.

TUNIS GRADE LAMBS. FIG. 44.

Contagious Catarrh or Ophthalmia in Sheep.

1. What ails my sheep? Their eyes commence to run water as though they had got something into them, sometimes only one at first, but the other will soon be sore, and sometimes both eyes are taken at once. After about one week there will be a film over the eyes, and they are blind. The sheep appear well otherwise; there has not been any one of them that has got over it yet. 2. What will cure barn itch on cattle? S. W.

Vermont.

1. Confine the sheep in a comfortable, darkened stable, but where there is good pure air. Supply fresh drinking water daily, and feed some succulent food, such as roots, potatoes, apples or silage. Give each sheep two to four ounces (according to the size of animal) Epsom salts with one or two teaspoonfuls ginger, dissolved in a half-pint warm water, and administered by drenching. If the eyes are inflamed, a wet bandage can be tied over the eyes until the inflammation is reduced. Whenever the white film forms over the eye put two or three drops of a solution of two to three grains nitrate of silver in an ounce of soft water, and repeat daily. 2. For barn itch try treatment for lice frequently advised in these columns.

Horse Thin in Flesh.

I have just purchased a mare 10 years old, weighing 1,000 pounds, very thin in flesh. She should weigh 1,150 or 1,200. She is sound in wind and limb; eye bright, appetite first class; stools natural and seem to indicate good digestion. I see no indication of worms. I know nothing of her recent history, but the man who had her, a green horse from the West five years ago, sold her because she was nervous and he "could not keep flesh on her." He has the reputation of being "hard on horseflesh." I have only work enough to exercise her the next three months. What is the best course to pursue? She has commenced to shed her coat, and condition of bowels does not seem to indicate that physic is required. What grain shall I feed? I am using cornmeal; also giving her poplar bark green, which she eats freely. Is there any danger that such a horse cannot be put in good condition? E. D. G.

Massachusetts.

There are some nervous horses that will never put on much flesh, even with the best of care and feeding, and this mare is probably one of them. As a general tonic, give one of the following powders in her feed night and morning: Powdered gentian, ginger and nitrate of potash, of each eight ounces, powdered nux vomica, four ounces, Epsom salts, 16 ounces; mix and divide into 32 powders. I would suggest replacing one-half of the cornmeal by three parts of ground oats or bran and middlings, and one part linseed or oil meal.

Hog Cholera and Swine Plague.

Can the hog cholera arise in any locality spontaneously, or only by contagion? What is best to do after it is discovered to be in a herd? What are the proper precautions to prevent it? After one attack, will the animal be immune from a second?

Westover, Md. O. S.

The epidemics of swine disease in this country are now known to be due to at least two contagious diseases, known as hog cholera and swine plague. These two diseases resemble each other very closely, both in their symptoms and in their effect upon the animals, so that in most cases an autopsy, or even a microscopical examination, is necessary in order to determine definitely which disease is present. The two diseases may appear independently, or as is very commonly the case, both appear in the same outbreak. The hog cholera is not known to arise spontaneously, but is always due to the introduction of the specific germ into a herd from an infected herd or locality. The infection may be carried by any animal having access to diseased animals or their products; by water or by straw or other litter blown from one yard to another. The characteristic lesions of hog cholera are hemorrhages, particularly in the spleen, lymphatic glands, and in the subcutaneous, submucous and subserous connective tissues; and ulceration of the mucosa of the cæcum and upper portion of the colon, or larger intestine.

The swine plague, unlike the hog cholera, may under favorable conditions arise spontaneously. The germ of swine plague is normally present in the air passages of nearly all swine, but in a mild or non-virulent form. Under certain conditions this mild form of the germ may acquire sufficient virulence to cause an outbreak of the disease, which may be spread by contagion from one herd to another, as in hog cholera. The characteristic lesions of swine plague are inflammation of the lungs, inflammation of serous membranes, and congestion or inflammation of the intestines. One attack of either disease usually protects the animal from a second attack. For the prevention and treatment of the disease, I would advise you to send to the Bureau of Animal Industry, United States Department of Agriculture, for Farmer's Bulletin No. 24 on hog cholera and swine plague. Should an outbreak of either disease occur in your vicinity I would suggest that you write Dr. D. E. Salmon, Chief of the Bureau of Animal Industry, Washington, D. C., for the serum treatment of hog cholera and swine plague.

But to make doubly sure we will make good any loss to paid subscribers sustained by trusting any deliberate swindler advertising in our columns, and any such swindler will be publicly exposed. We protect subscribers against rogues, but we do not guarantee to adjust trifling differences between subscribers and honest, responsible advertisers. Neither will we be responsible for the debts of honest bankrupts sanctioned by the courts. Notice of the complaint must be sent us within one month of the time of the transaction, and you must have mentioned THE RURAL NEW-YORKER when writing the advertiser.

Name and address of sender, and what the remittance is for, should appear in every letter.

Remittances may be made in money order, express order, personal check or bank draft.

THE RURAL NEW-YORKER,
409 Pearl Street, New York.

SATURDAY, FEBRUARY 16, 1901.

MR. Manchester touches a vital point on the pocketbook nerve (page 111) when he shows the difference between weight and measure in feeding grain to cows. This same mistake runs all through business. We get into the habit of comparing things with the eye, which is only a half comparison at best. It is an old saying that "the master's eye makes the fat ox," but the master's scales will fatten both ox and pocketbook.

*

IN connection with the article on New York farming a few stock statistics will be interesting. The last census taken found 5,548 cattle, 75,809 horses, 637 mules, 4,077 sheep, 1,482 swine and 226 goats on Manhattan Island. The remarkable feature of this is that 226 goats can make such a remarkable showing. Let a stranger travel through the upper part of New York and he will surely report thousands of goats at large. The census man could find only 226. Give us 226 men as tireless and "numerous" as New York goats, and we will agree to move the world.

*

SOME of the so-called farmers' organizations of this country are useful chiefly as illustrations of what such things ought not to be. This is not true of the Connecticut Pomological Society, which is, in many respects, a model. It is controlled by the fruit *growers* and is conducted in their interests. The nurserymen have a fair showing, but the growers come first—as they should. The influence of this Society has been remarkable. It is recorded in the orchards all over Connecticut, especially in the quality of the fruit. Yes, the horticulturists of dozens of other States might well take this Society for a model. Perhaps, though, they would have to import a few Yankees in order to build it!

*

THE Senators who make up the minority of the Senate Committee on Agriculture say that the Grout bill is a menace to a legitimate industry. Let's see about that. There are 17 manufacturers of oleo, and about 5,000,000 people who depend more or less upon the cow for their living. The 17 make their money by coloring cheap fats in imitation of butter, and selling this product at a price which is based on the belief that it is pure butter fat. As at present conducted, the most profitable and important feature of the oleo business is the deception attempted and practiced by those who make and sell it. The Grout bill will, as we believe, do more to break up this fraudulent and deceptive business than anything yet proposed. The true "menace to a legitimate industry" comes with the defeat of the Grout bill.

*

SOME men who are invited to talk before conventions and institutes imagine that their reputation is going to carry them through rather than hard work. We have in mind now a man with a National reputation, who traveled hundreds of miles to address a dairy convention, but instead of having his subject fully prepared, and a systematic line of thought to offer, seemed to wait for the spirit to move. We heard him tell, just before his address, some reporters who were after points that he "hadn't the least idea what he should say. Nothing written out," etc. We think he was right. The inspiration theory didn't work; the talk was ragged and dry, and instead of enthusing his audience and adding to his reputation, our opinion is he will not be invited again. The class of farmers who attend dairy conventions are of the higher grade, students and readers of dairy literature. "Patent matter" or anything second grade will not fill the bill. To give an audience new ideas, or old ones in new form that will set their minds at work and make them better farmers, is worthy of the highest encomium, but it requires careful preparation and a good solid foundation first of all. The "I-feel-above-you," or "I-know-it-all" spirit discourages, but the "I'm-one-of-you" and "humbly-but-very-cheerfully-trying-to-help-you" spirit lifts up at once.

*

IN Maine paupers are cared for at public expense on town farms. In a certain Maine town a pauper applied to the authorities for help. He had four children. The selectmen carried the children to the poor house in a wagon, while the pauper himself *rode there on his own bicycle!* That must indeed be a flourishing section, where even the paupers are able to own bicycles. Two reasons were given the writer for the fact that in most rural districts of Maine there were few very rich people and still fewer very poor ones. These reasons were—Prohibition and apple culture. It was stated that the wheelman mentioned above was a pauper by heredity. Both his father and grandfather before him spent part of their lives in the poorhouse. It is perfectly safe to say that the intelligent production of first-class red apples will bring general prosperity to any rural section of New England.

*

SEVERAL weeks since Prof. Phelps told us how the proportion of protein in hay was increased by the use of extra nitrogen in the grass. Other experiments show much the same thing. The Tennessee Station tried some experiments with corn, using various mixtures of chemicals. The corn grown where no nitrogen was used gave an average of 10.88 per cent of protein. Where nitrogen was used the average was 11.66 per cent. This fact, that the composition of our grains and fodders can be changed by the use of soluble nitrogen, is an important one, especially for dairymen. The man with a good corn crop is well provided with carbonaceous food, whether he shreds the dry stalks or puts them in a silo. It is the payment for the protein that empties the pocketbook, and if by using soluble nitrogen we can add one or more per cent of protein to our rough fodder, it is the best of business to do so.

*

LAST week we printed a news item to the effect that oleo had been bought by agents of the New York School of Forestry and paid for by the State. We desire to state that this has nothing to do with the College of Agriculture at Cornell, which is wholly distinct from the College of Forestry. The two colleges are not connected in their business organizations. We are informed that the oleo was bought by some one connected with the Forestry College in ignorance of the law. It was supplied to contract woodchoppers in the Adirondack forest, and the purchase was a blunder—not a crime. We make this statement because some have gone so far as to say that Cornell University favors the use of oleo. That is too absurd to be considered for an instant. Such a thing could not possibly occur in the College of Agriculture, and the University will make the matter right promptly and effectively.

*

WHAT have our scientific friends to say to the man who, on page 110, frankly says that he does not know what "protein" means? Here is an intelligent man, evidently, with a good library, who balks at one of the most important terms used in discussing scientific agriculture. The experiment-station men have dug out a vast number of important facts connected with stock and plant feeding. They have published these facts in what seems to them clear and simple language. It is clear enough to the 10 per cent of farmers who follow such things, and study them. It is evidently not so clear to the 90 per cent who are not naturally interested, but who may need the information even more than the others. We think that the scientific men have been more successful in digging out facts than they have been in rubbing them in where they belonged. Strictly speaking, it is probably not their business to attempt to do this rubbing in. They have pretty well done their duty when they finish digging out the truth.

*

AT this season, a painful sight to every horse lover is the straining effort of the business teams to get up the gangway from the New York ferryboats. The combination of heavy gales with falling tide drives the water out of the river, and although the ferry piers are floating, rising and falling with the water, the variation is often so great as to cause a mountainous slope of the gangway. Here the heavily-laden horses strain and tug, too often cruelly lashed by brutal drivers. It is a noticeable fact that, among these teams, small private owners do not appear to give the same care and kindness to their animals as big business firms. One would think that the small truckman or dealer whose horse is his working partner, and to whom the animal represents much of his capital, would treat this faithful worker with extra kindness, but more often it is the hired teamster who is seen encouraging his horses in a hard place, and using moral suasion rather than the whip. The fact is that brutality to any working animal does not pay, and a brutal driver is always a losing investment. That may explain the situation, for the hired driver who injured his horses would be discharged or docked.

*

WE find people who are disposed to make light of the San José scale. Some go so far as to call it a "scarecrow," got up "to give the entomologists something to talk about." These people probably never saw a tree or shrub that has been killed by the scale! There are many such—in fact, within the next few years thousands of trees will be as dead as posts from the attacks of this little insect. The question as to whether nurserymen should be compelled to fumigate their nursery stock before delivering it has now reached the point where most horticultural societies decline to discuss it through fear of a quarrel between nurserymen and growers. This seems to us a very short-sighted policy. We think there is no question but that nursery stock thus fumigated is safer to plant, but we frankly confess our doubt as to the wisdom of a compulsory law. Just now there is hope that spraying with crude petroleum will prove an effective remedy for the scale. The trouble is to find a grade of petroleum that will not injure the trees, and a pump that will spray it properly in a mechanical mixture with water.

*

BREVITIES.

RURALETTES.

Why are some people always found
Behindhand in the race?
They hide their talents in the ground
And then forget the place.

*

"Full many a flower is born to blush unseen
And waste its sweetness on the desert air"
Because no seedsman "boomed" it with an "ad."
And sent it running upward to "Get There."

*

If you do not love your work,
Even though you never shirk,
Though you toil unceasingly
You a slave will ever be.

*

"I love you!" 'Tis the highest compliment
That ever reached a woman's ear, I say;
When 20 years of married life have sent
The wrinkles chasing o'er her face; and gray
Into her hair. Then, if her husband can
Honestly say "I love you," 'tis the best
Tribute that can be wrung from any man,
And she who hears the words is truly blest.
For packed within them is a human life,
With all its longings, hopes and dreams and fears,
With which an honest man may crown his wife
Queen of her sex; in spite of wasting years!

NO one has a right to a wrong opinion.

LET frost get at the potato bin if you want to raise tuber kills.

TO err is human; to keep on erring after you know better is inhuman.

IT looks as though the evaporated raspberry might have another inning.

NO dairyman will lay up treasure who buys by weight and feeds by measure.

NO, snow is not a perfect "cover crop" for an orchard. Get something to grow.

THE more your orchard ground is tilled, the more with humus it should be filled.

WHAT are the most prominent parts of speech? With many speakers—wind and I.

ONE thing helps empty out the milker's pail. The edge upon the milker's finger nail.

WE feel sure that the waste molasses from beet sugar factories will prove a very useful stock food.

HOW is a man's self esteem pruned into a shapely and useful tree? By the judicious use of an honest wife's tongue.

THINK of a man who is not thorough enough to raise a good crop of potatoes imagining he can succeed with ginseng!

A NEW Porto Rican law now in force increases the internal revenue tax on oleo from two cents to 10 cents per pound.

THE recent death of Schuyler Worden removes another man whose works live after him—the Worden grape and Worden Seckel pear.

A GOOD woman is a crown to her husband! Correct, and if she does her duty her conversation will also be a cross at times.

IT has been found that when milk is held for 10 minutes in a closed vessel at 140 degrees, the bacillus or germ of consumption is killed, while the milk is not injured.

THE Oregon Experiment Station finds that a hot air temperature of 200 degrees, held for 10 minutes, will destroy the smut spores in seed oats. This gave better results than soaking in blue vitriol or formalin, or in hot water.

THE NEW YORK STATE GRANGE.

PRESIDENT'S REPORT.—The New York State Grange held its twenty-eighth annual session at Poughkeepsie, N. Y., February 5-8. The regular sesslons were held under the fourth degree of the Order, but an open session was held Tuesday night, and during a part of the session Wednesday afternoon. State Master E. B. Norris read his annual report the first day. In reference to Grange work he earnestly urged the organizatlon of Pomona Granges. If the County Granges are in a state of activity he claimed that there would be no dormant subordlnate Granges. The farmers are realizing that the Grange offers the best and most progressive ideal of coöperation, and that its advanced methods of instruction, both socially and educatlonally, place it preëminently in the front of all farmers' organizations. He also urged the lmportance of the degree work in the councils. In the matter of taxation and legislation, he said that the zealous aetivity of the members sometimes lead into labyrinths of entanglement that it becomes diffieult quiekly to emerge from. Let the Grange, he said, study well all the bills that are presented, and if any are found praetical, indorse them, and leave nothing undone to push them to a speedy passage. There is no one thing so hard to solve by legislation as an equitable tax bill that shall do justice to all classes. He spoke a good word for the Department of Agriculture, for the farmers' institute, and for the State Fair under the present management. He referred also to the injury done the dairy interests of the State by the fraudulent imitation of dairy products, and spoke a word in favor of the Grout bill. The adoption of free rurai mail wiil, he said, rank as the one grand achievement of the Grange. It was adopted in spite of the opposition of the political managers of both parties, but the trial proved to the Post Office Department that it was not oniy a great boon to the Amerlean farmer, but also a saving of money to the Department. He indorsed the action of the National Grange in its opposition to the Subsidy bili, because farmers' products have to go into open competition with the world, and he did not believe in their contributing a penny for the ship-builders' trust. He opposed the proposition to irrigate western lands at Government expense, and uttered a word of eaution against the trusts. He also made a vigorous protest against the expenditure of $62,000,000 by the State on the canal.

SECRETARY AND CHAPLAIN.—Secretary Giles made a very satisfactory report on the condition of the Grange; 14 new Granges were organized, and one reorganized during the year, and severai others are under way for organization. There are 524 Granges now in the State; 44 counties are represented, 29 of which have Pomona Granges. Jefferson County stands at the head, with 32 Granges and 4,875 members. Steuben has 31 Granges, Chautauqua 28, with 3,679 members. Wayne has 16 Granges, with 3,028 members; averaging 200 members to the Grange. Oswego has 30 Granges, with 3,087 members. Wolcott, Wayne County, has the largest subordinate Grange, with 759 members. The total membership of the State is 49,029. Treasurer's report was equaliy satisfactory; showing a balance on hand of $13,897.33. The second day was largely taken up by reports of subordinate officers. J. E. Knapp, Ceres, of Denmark, made an interesting report, principally dealing with the advantages of the Grange. Mrs. W. W. Streever, Pomona, of West Milton, recounted the progress of the Grange, and dealt with rural matters generally, and among other good things said that while the farmers are always cautious, they never will let caution interfere with legitimate progress. Lady Assistant Steward, Mrs. W. W. Ware, of Batavia, told of some excellent charitable work done by the Ladies' Aid Society in connection with the Stafford Grange. This Grange appropriates $3 a month, and the money is used by the ladies in making clothing for the poor and needy. Overseer Geo. A. Fuller, of Philadelphia, made some good suggestions for Grange work, and gave some strong advice to farmers generally, the main feature of which was "push." Chaplain A. H. Dewey, of Manchester, made a report of his year's work. He made a point from Bible history to show that the righteous men and women of the Old Testament times were the original Grangers. Steward Chas. A. Mann, of Breakabeen, insisted that it was everybody's business to bring into the Grange farmers who would be benefited by the Order. He urged that wherever farmers' institutes, or farmers' gatherings be held, the teachers and children of the public schools should be invited, and programmes required for their entertainment. The boys and girls of the present are to be the Grangers of the future, and he wanted to start their education for the work now. Assistant Steward J. J. Bell, of Deposit, claimed that the Grange is now only in its infancy, and that this organization will enable the farmers of the country to exert a united influence for the benefit of just legislation. Gatekeeper M. J. Harding, Hornelisville, and Mrs. W. H. Buckley, of West Groton, reported on their respective duties.

SCIENTIFIC AGRICULTURE.—Dr. W. H. Jordan was the principal speaker at the open session Tuesday night. He talked principally on the scientific side of agriculture, and repeated the plea that he has made in other parts of the State, and before other bodies of farmers, for the teaching of primary elements of agriculture in the common schools of the State. Some things that the Doctor said about agricultural papers were apparently misunderstood by some members of the audience. It is true that after discussing them, he said that some of them were not worth what they cost, but this did not, to our mind, imply a condemnation of all, but rather a suggestion for discrimination in the selection of them. There are some papers with agricultural titles that every thinking farmer, as well as Dr. Jordan, knows are agricultural only in name. We suppose that Dr. Jordan, in talking on the subject, would say that there are experiment stations that are hardly worth what they cost, and literature often issued from these stations that is not worth what it costs, but he would not on that account condemn all experiment station work nor all experiment station literature.

CANAL MATTERS.—The latter part of Wednesday afternoon session was occupied by James Wood, of Mt. Kisco. His subject was the proposed $62,000,000 State canal, and he gave some arguments against the propositlon that will be rather hard to dispute. In part, he said that Governor Roosevelt has thrilled and pleased the people of the State by a proposed retrenehment and reduction of State expenses, but the proposition for an enlarged canal is so tremendous as to make insignificant any reduction that could possibly be made in State expenses. The bill is a misnomer. There is not a lock on the old canal, nor a bank along it, nor a bridge across it that can be utilized in the new proposition. The real purpose is for a new canai. To say that it is an improvement of the old one is a deception. Judging by the past, $62,000,000 is only a basis to start on, and by the standard of other experiences it must be expected that it will cost anywhere from 50 to 250 per cent more.. The eommission already intimates that it will probably require $100,000,000, and it can safely be estimated that it would eost in the neighborhood of $200,000,000 before compieted. Every man who was bold enough to oppose the proposition, he said, is charged as being in the employ of railroads, and he wanted to make it clear on the start that for himseif he never was employed by any railroad, never expeeted to be employed by any railroad, has always paid his fare when traveling on the railroad, and never asked for or received a pass for riding on any railroad. He then reviewed the progress made in transportation facilities, starting with the bundle of furs carried on the backs of the Indians to the first shipload exported from Yonkers in this country across the water. Next eame the pack-horses, then the wagons over the State roads, then the canals, and finally the railroads. The Erie Canal was completed in 1825. The first railroad of the State was built three years afterwards and ran from Albany to Schenectady. In 1842 the line was completed from Albany to Buffalo; in 1851 to New York. The railroads do practically ali the transportation now. The Erie Canai reached its maximum of transportation in 1880, yet in 1882 it abolished tolls and made the canal free. That is, free to the owners of boats, but the taxpayer has been paying the toll ever sinee. Every man who pays a dollar of tax helps pay that toll. We pay $2,500,000 of canal toli every year. The farmers are paying their share of this in order that the western grain may be shipped into the eastern markets to compete with the product of the New York State farmers. This is what has helped reduee prices of farm products, and has taken 50 per cent out of the value of farm lands. The farmer of the East is paying the freight on the other man's product, thus helping the other fellow to drive the New York farmer out of the market. Then he went on to show that the handling of freight by the railroads is simply a "survival of the fittest." The canal only transported 2,145,000 tons of freight last year; the railroads 40,000,000. The competition between railroads, he said, has compelled them to employ talent to reduee the cost of the transportation. This cost is only one-third of what it was in 1870. He quoted from a report of a committee which investigated this matter for the English railroads, beeause in this report there could be no purpose of falsifying the figures. This showed that in 1855, the cost of transportation over the New York Central was 3.72 cents per ton per miie. In 1899 the cost of transporting one ton one mile had reduced to .59 of a cent. Advocates of the canal claim that this is because the eanal forced the reduction; but referring to the same report it is shown that in 1882 the average rate over the railroads of the United States for transporting one ton one mile was 1.236 of a cent. In 1898 the same average was .75 of a cent per ton. A further proof that the canal had nothing to do with this reduction is shown from the fact that in 1865 the average cost of passenger transportation over the New York Central was 2.026 cents per mile. In 1899 the average rate per mile was 1.82 cents. It could not be claimed that the canal had caused this reduction, simply beeause the canals carry no passengers. The railroads, he said, have made the first reduction in freights, and the canals were obliged to follow. He ridiculed the idea that 5½ per cent of the total tonnage carried by the canal couid have any influence on the cost of transportation. He went on to show besides that since 1882 the railroads of the State had paid into the State Treasury $40,000,000 in taxes, while during this time the taxpayers of the State had paid to the canals $2,700,000, without including the $9,000,000 which he was first inclined to say had dropped into the ditches, but which on second thought he revised to say, went into the pockets of designing politicians, and this, he insisted, was the key to the whole situation. It was not that the men behind this proposition cared for the canal, nor for the reduction of rates, but for the pickings they could get out of such an enormous appropriation. He disposed of the argument that the progress made by the State of New York over other States since the Revolution was traceable to the canal by showing that the canal was not built until 1825, and that in the census of 1820 New York State had already taken the lead of other States in the Union. To the claim that we need the canal in order to build our industries of the State, and especially the iron industries. he showed that if the iron ore were shipped through the canal entirely free it would build up no iron industries along the route of the canal, because of the expense of getting coal in these sections. The iron industries must always be located where there will be the least expense in getting the ore and coal together. New York and Buffalo, he said, were the only sections of the State that were calling for the canal, and in his analysis of the situation he failed to find any very good reason why the people and business men of those cities should make any demand for it. There are not to exceed a hundred men employed on the canal located at Buffalo, and for every ton transported over the canal during last year the City of New York paid $1.19. If the people of the City of New York understood the situation they would be as much opposed to it as the farmers now are. There was certainly no question about the feeling of the farmers on this subject. There was not a delegate from any county in the State that favored the proposition.

RESOLUTIONS were introduced condemning the barge canal scheme; one favoring the election of United States Senators by a vote of the people; others in favor of the postal savings banks, and one opposed to the Subsidy bill; one favoring the giving of elective franchise to taxpaying women; another opposing the bill allowing saloons to remain open nights and Sundays at the Pan-American Exposition at Buffalo; one opposed the repeal of the law relatlng to instruction on the effects of alcohol in public schools; another in favor of repealing the Saturday half-holiday; one favorlng a law to prohibit the stopping of trains on railroad erossings. The resolution was introduced lndorsing the actlon of Governor Odell in reducing State expenses; another eondemning fake and immoral shows at county falrs, and one indorsing the administration of Commissioner Wieting, and recommending his reappointment. D.

EVENTS OF THE WEEK.

DOMESTIC.—January 31 an explosion in a cigar-box factory in New York City caused a eostly fire, the loss amounting to $1,500,000. Three persons were badly injured, and the blaze lighted up the whole city. It is supposed that the explosion was caused by fine cedar sawdust. . . . . At Baltimore, Md., January 31, the burning of a zoological show killed 50 lions, 20 bears, and more than 200 other wild animals. The property loss was $200,000. . . . . January 31, the health officers discovered 19 cases of smallpox among Italians in New York tenement houses. New cases continue to be reported nearly every day. . . . . The explosion of a lamp in a dwelling at Milwaukee, Wis., February 2, eaused the death of six persons. . . . . At Pittsburg, Pa., February 2, one person was killed and five others made seriously ill by eating pork said to be doctored with some preservative. . . . . At Petroleum, W. Va., a disastrous railroad wreck occurred January 26, six trainmen being killed. . . . . The Secretary of the Interior has requested the Secretary of State to correct, through United States representatives, reports circulating in several foreign countries, that the United States Government is offering $10,000 to men who will marry Indian squaws. Scores of letters accepting this alleged offer have been received from France and Germany and one from Russia. . . . . A big business building at Pittsburg, Pa., collapsed February 4, and flames completed the work of destruction, the damage amounting to $200,000. . . . . An explosion of gas and dynamite in a mine near Scranton, Pa., February 4, killed one man and injured others. . . . . An express car on the Pennsylvania Railroad was rifled between Philadelphia and New York February 3, the robbers securing about $4,000. . . . . Two persons were killed and three fatally injured in a hotel fire at Binghamton, N. Y., February 5. . . . . The Masonic Temple at Toledo, O., was burned February 5; loss $150,000. . . . . The centennial anniversary of the installation of John Marshall, of Virginia, as Chief Justice of the United States, was commemorated February 4 in Washington. In the presence of the President and his Cabinet, members of the Senate and House, the diplomatic corps and other distinguished guests, an oration was delivered by ex-Attorney-General Wayne MacVeagh. Chief Justice Fuller presided and made an address. . . . . In Chicago, 250 saloon keepers were arrested February 4, charged with keeping their saloons open on Sunday.

CONGRESS.—The House passed the Agrienitural Appropriation bill January 31. The feature of the day's proceedings was a revival of the anti-polygamy crusade, and a sharp passage between Messrs. King, of Utah, and Landis, of Indiana. The latter secured the adoption in Committee of the Whole of an amendment provlding that no money should be paid to the Agricuitural College in Utah untii the Secretary of Agriculture was satisfied that no trustee or teacher in the institution practiced polygamy. The amendment was afterward stricken out in the House. . . . . January 31, the Senate passed the Army Reorganization bili. . . . . The House, February 4, passed the Senate bill to create a commission to adjudicate the claims of United States citizens against Spain, which the Government of the United States assumed by the treaty of Paris, after having amended the bill so as to refer the claims to the Court of Claims. . . . . The Army appropriation bill, making provision for the army under the plan of reorganization recently enacted, was completed February 4 by the House Committee on Military Affairs, and reported by Chairman Hull. It carries approximately $118,000,000, as against estimates of about $130,000,000, made by War Department officials. The total of army appropriations, general and deficiency, last year, was $119,000,000. Chairman Hull says the present bill will be ample, and will not entail a deficiency measure later. The contingency appropriation of $1,000,000, to "meet emergencies constantly arising," was struck out by the committee.

PHILIPPINES.—Fierce fighting has been occurring in the Island of Leyte. In Luzon fighting continues, and quantities of arms are being seized. . . . . In the Province of Iloilo, 50,000 Filipinos have sworn allegiance to the United States.

FARM AND GARDEN.—Schuyler Worden, the originator of the Worden grape and Worden Seckel pear, died at his home in Oswego County, N. Y., January 20, aged 90.

The horticultural commissioners of Orange Co., Cal., have instituted a quarantine against Florida and Louisiana nursery stock on account of the alleged prevalence of an insect known as the White fly (Aleyrodes Citri) on the stock.

Heavy snow throughout Kansas February 2 will benefit the wheat greatly, as the State has been swept by drying winds for four weeks.

Great bush fires are causing appalling loss to farmers in Australia. While the thermometer stands at 115 to 120 in the shade, and deaths are frequent from heat apoplexy, hundreds of families have been burned out. Many marvelous rescues were made. One man in a farmers' wagon drove 169 persons from the fire circle and sure death three miles to a river, where they all remained immersed with their mouths and noses only above water until the fires had passed over them. Miles of grain have been destroyed, and great droves of sheep and cattle have perished.

ADVICES from Pittsburg state that the price on cut nails has been raised five cents per keg, making the rate to jobbers now $2 per keg in car lots. This is due to the recent advance in wire nails.

Woman and Home

From Day to Day.

OLD HYMNS.

There's a lot of music in 'em—the hymns of long ago—
And when some gray-haired brother sings the ones I used to know,
I sorter want to take a hand! I think of days gone by,
"On Jordan's stormy banks I stand and cast a wistful eye!"

There's a lot of music in 'em—those dear, sweet hymns of old—
With visions bright of land of light, and shining streets of gold;
And I hear 'em singing—singing, where mem'ry dreaming stands,
"From Greenland's icy mountains to India's coral strands."

An' so I love the old hymns, and when my time shall come,
Before the light has left me, and my singing lips are dumb,
If I can hear 'em sing them then I'll pass without a sigh
To "Canaan's fair and happy land, where my possessions lie."

—The Cooking Club.

*

THE Kansas City Star offers an eloquent plea for a return to good old-fashioned mush or hasty pudding in place of the modern food cereals now so freely purchased. After recalling the fond recollections awakened by thoughts of fried mush and syrup, regret is expressed that under the false plea of hygiene, the comfortable and substantial dishes of a more sincere and genuine age are replaced by preparations that are anæmic and trifling. Says the writer:

Shredded biscuits and Scotch oats, indeed! Are these cereal impostures to nourish the manhood and womanhood of the twentieth century in the United States of America? Perish the thought! Out with such a paltry desertion of finer and stronger ideals? Away with such hospitality to enfeebling innovations! Throw away the stew pan! Hang on the mush pot! Let the blaze burn clear and strong, and wield the ladle with a hearty good will. Shake off the enervating influences which came in with the abandonment of "hasty pudding" and get down to first principles!

*

JOHN WESLEY said: "I no more dare to fret than I dare to curse or swear." Many a good woman, to whom profane or irreverent speech is a horror, falls into the habit of nagging fretfulness, without ever regarding this vice as anything more than a trifling failing. Yet home happiness has been wrecked, and families disorganized, by nothing more than the perpetual worry of one complaining and fretful person. Not only

3717 Seven-gored Tucked Skirt, 22 to 30 in. Waist.

does this disposition ruin the happiness of those around; it surely poisons the character of the person giving way to it. A familiar proverb says that the good die young; we take this to mean that the good remain young until the end of their days, whether that come in childhood or old age. A serene and peaceful mind, free from strife and envy, will keep one young to the end of a long life, and one may say that the cheerful, like the good, die young, even when they exceed three score and ten.

WASH fabrics in all sorts of brilliant and striking styles now crowd the city stores. Domestic materials seem much handsomer than before, giving the beau-

3696 Tucked Blouse, 32 to 40 in. bust.

tiful colors and combinations of foreign fabrics. Aureole batiste at 15 cents a yard suggests fine China silks, one especially dainty being a small all-over design in white on a gray background. Sea Island dimities, also at 15 cents, are really lovely, especially in coral patterns, such as our grandmothers wore in barége. Dimity rayée, which costs 18 cents a yard, has stripes of satin effect, all the rest of the surface being covered with a figure, scrolls, dots or flowers. Stripes simulating lace in pattern are used a good deal, a figure like black Chantilly insertion being seen between two-inch stripes of turquoise blue, coral pink or old rose, the color being spattered with circles or dots. Of course there are plenty of very handsome high-priced wash fabrics, but one may find a surprising list of dainty and attractive materials between 10 cents and 25 cents a yard. We have very little trouble with fading in laundering our Summer garments, but they are washed at home with some care, and always dried in the shade, the latter being, we think, quite an important point.

*

WE recently published, at the request of a reader, a recipe for entire-wheat bread. Mrs. Gesine Lemcke, of the New York Cooking School, gives the following recipe, which differs slightly from that previously suggested: Put one pint of lukewarm water in a bowl, add one yeast cake broken into pieces, one teaspoonful of sugar, let stand until the yeast floats on top, then add two pints of whole wheat flour, half a teaspoonful of salt, two tablespoonfuls of sugar and a half ounce of melted butter. Mix all together into a firm dough; knead it on a board, adding some fine wheat flour, until it does not stick to the hands; return the dough to the bowl, cover, and let rise to double its size; then mold it into a loaf, put in a pan, let rise again until light, and bake one hour in a medium hot oven.

The Rural Patterns.

Skirts tucked in groups are still in favor, and are likely to be freely used in thin materials during the Summer. The model illustrated is the very latest that has appeared and combines all the newest features. As shown it is made of wool crêpe in cadet blue, but is suited to all materials; cloth, silk, cashmere, crêpe de Chine and the entire range of available stuffs. The skirt is cut in seven gores. The tucks, which are a half-inch in width, are laid at the straight edge of each side and back gore, there being six groups in all, three at each side. They are stitched and pressed flat to the point indicated, below which they are left free to fall in soft folds to the floor. The upper portion of the skirt is fitted closely and smoothly, but it flares stylishly as it falls below the knees. The fulness at the back is laid in double inverted pleats that meet over the center seam. To cut this skirt for a woman of medium size 8⅝ yards of material 21 inches wide, 5¼ yards 44 inches wide, or four yards 50 inches wide, will be required. The pattern No. 3717 is cut in sizes for a 22, 24, 26, 28 and 30-inch waist measure; price 10 cents.

A blouse of finely-tucked material is a favorite style; as illustrated it is of satin Aiglon in pastel blue with cuffs of panne in a deeper shade and is worn with tie and belt that match; but both silk and wool crêpe are admirable, soft-finished taffeta and satin régence are much liked, as are all the softer silks, while mousseline and Liberty are always lovely. The foundation for the waist is a lining fitted with single darts, under-arm, back and shoulder seams. The waist proper is laid in fine, evenly-shaped tucks, allowance for which is made in the pattern, and is arranged over the lining with slight easy fullness at neck and shoulders in front, closing at the center front, where the tucks conceal the fact. The sleeves are modeled after the latest style, and are arranged over a smooth fitted lining. The outer portions are tucked to a few inches above the wrists, where they fall free and form puffs that are tacked to the lining which ensures a perfect adjustment. At the wrists are bands finished with pointed ends that lap over and hook into place. To cut this blouse for a woman of medium size 4⅞ yards of material 21 inches wide, 2¼ yards 44 inches wide, or 2⅛ yards 48 inches wide, will be required. The pattern No. 3696 is cut in sizes for a 32, 34, 36, 38 and 40-inch bust measure, price 10 cents from this office.

MOTHERS.—Be sure to use "Mrs. Winslow's Soothing Syrup" for your children while Teething. It is the Best.—*Adv.*

Wanted

Farmers whose lands do not pay to apply

B. T. Babbitt's

Pure Potash

or Lye

to their trees and plants, and to report, as all its users do, that this excellent potash has wonderfully improved and increased fruit-bearing and vegetable raising.

MADE BY

B. T. Babbitt, New York.

Sold by grocers and druggists everywhere.

Economizes soap, labor and time. **AGENTS WANTED.** Exclusive territory given. Big money made. For terms and prices Address,

Portland Mfg. Co., Box 14, Portland, Mich.

A REMARKABLE INVENTION

BY AN OHIOAN.

A prominent business man of Cincinnati has invented a new Vapor Bath Cabinet that has proven a blessing to every man, woman and child who has used it, and as many of our readers may not know of its real comfort and blessings, we illustrate it in this issue.

This cabinet is an air-tight, rubber-walled room, in which one comfortably rests on a chair, and with only the head outside, enjoys all the cleansing,

Open—Ready For Use.

curative, beautifying and invigorating effects of the famous Turkish Bath, Hot Vapor or Medicated Bath at home, for 3 cents each, with no possibility of taking cold or in any way weakening the system.

These baths have truly marvelous powers, far superior to soap and water; celebrated for producing glowing faces, fair skin, bright eyes, elastic figures and perfect health to all men and women who make them a weekly habit, and this invention brings them within the reach of the poorest person in the country.

Clouds of hot vapor or medicated vapor surround the entire body, opening the millions of sweat-pores, causing profuse perspiration, drawing out of the system all the impure salts, acids and poisonous matter of the blood, which, if retained, overwork the heart, kidneys, lungs and skin, causing colds, fevers, disease, debility and sluggishness.

Astonishing is the improvement in health, feeling and complexion by the use of this Cabinet, and it seems to us that the long-sought-for method of securing a clear skin, a good complexion, of retaining good health, curing and preventing disease without drugs, has certainly been found.

The makers inform the writer that more than 600,000 of these Cabinets have been sold, and showed letters from thousands of users who speak of this Cabinet as giving perfect satisfaction.

A. B. Stockham, M.D., of Chicago, editor of "Tokology," recommends it highly, as also does Congressmen John J. Lentz, Hon. Chauncey M. Depew, Rev. C. M. Keith, editor "Holiness Advocate;" Mrs. Senator Douglas, Rev. James Thoms, Ph.D., pastor First Baptist Church, Centreville, Mich.; Rev. J. C. Richardson, Roxbury, Mass.; Rev. H. C. Roernaes, Everett, Kansas; John T. Brown, editor "Christian Guide," and thousands of others.

Ira L. Gleason, prominent citizen of Hutchinson, cured himself of rheumatism and his friends of colds, pneumonia, fevers, grippe, blood, skin and kidney diseases, and made $2,500 selling this Cabinet in a little more than 12 months. Mrs. Anna Woodrum, of Thurman, Iowa, afflicted 10 years, was promptly cured of nervous prostration, stomach and female troubles, after medicines and doctors had failed. She recommends it to every woman as a God-sent blessing. O. C. Smith, of Mt. Healthy, Ohio, was cured of bad case of catarrh and asthma, and says: "It was worth $1,000 to me. Have sold several hundred cabinets; every one delighted." O. P. Freeman, an aged railroad man, afflicted 17 years, unable at times to walk, was cured of kidney troubles, piles and rheumatism. Thousands of others write praising this Cabinet, so there is absolutely no doubt of it being a device that every reader of our paper should have in their homes.

This invention is known as the new 1903 style, Quaker Folding Vapor Bath Cabinet, and after investigation we can say that it is well, durably and handsomely made of best material throughout, has all the latest improvements, will last a lifetime, and is so simple to operate that even a child could do it safely. It folds flat in one inch space when not in use; can be easily carried; weighs but 10 pounds.

It Is Important to Know

that the makers guarantee results and assert positively (as do thousands of users) that this Cabinet will clear the skin, purify and enrich the blood, cure nervousness, weakness, that "tired feeling," and the worst forms of rheumatism (they offer $50.00 reward for a case not relieved). Cures Women's Troubles, Neuralgia, Malaria, Sleeplessness, Gout, Sciatica, Headaches, Piles, Dropsy, Liver, Kidney and Nervous Troubles and Blood Diseases.

In Operation.

It cures the worst Cold in one night and breaks up all symptoms of La Grippe, Fevers, Pneumonia, Bronchitis, Tonsilitis, and is really a household necessity, a blessing to every family. To please the ladies a Head and Face Steaming Attachment is furnished if desired, which clears the skin, beautifies the complexion, removes pimples, black-heads, eruptions and is a sure cure for skin diseases, Catarrh and Asthma.

All Our Readers Should

have one of these remarkable Cabinets in their home.

Don't fail to write to-day to the World Mfg. Co., 2823 World Building, Cincinnati, Ohio, who are the only makers, for full information, valuable booklet and testimonials sent free, or, better still, order a Cabinet. The price is wonderfully low, only $5.00 for Cabinet complete, with stove for heating, formulas and plain directions, also Prof. Gering's $2 Guide Book health and beauty, free. Head Steamer, $1 00 extra. You won't be disappointed, as the makers guarantee every Cabinet, and will refund your money after 30 days' use if not just as represented. We know them to be perfectly reliable; capital, $100,000.00, and to ship properly upon receipt of your remittance.

Don't fail to send for booklet anyway.

$100 Monthly and Expenses.

This Cabinet is a wonderful seller for agents, and the firm offers excellent inducements to both men and women upon request.

Millions of homes have no bathing facilities, so this is an excellent chance for our readers. To our knowledge many are making $100 to $200 per month and expenses. Write them to-day.

Sunshine

Have you had a kindness shown?
Pass it on.
'Twas not given for you alone—
Pass it on.
Let it travel down the years,
Let it wipe another's tears,
Till in Heaven the deed appears,
Pass it on.

President-General, Mrs. Cynthia Westover Alden.
Headquarters, No. 96 Fifth Avenue, New York.
Society Motto—"Good Cheer."
Colors—Yellow and White.
Flower—Coreopsis.
Society Song—"Scatter Sunshine."

THE TASK.

It matters not if great or small,
The task for which a soul is fit;
The splendid duty placed on all
Is that of nobly doing it.
And the accounting is the same
To Him who sets all tasks address'd,
If we can say, with truthful claim—
"Master, this is my best."

The homely task, in lowly ways,
If faithful and of purpose true,
It is as certain of God's praise
As that the proudest soul shall do.
O, not the task counts in His eyes,
But the glad strength in service press'd,
And the firm heart which joyous cries—
"Master, this is my best."

—St. Louis Republic.

Sunshine welcomes as a new member our friend Mignonette, a sorely-tried shut-in. She married at the age of 18, her husband studying for the ministry. Owing to his delicate health the young couple decided to settle on a farm. Six months after marriage the young wife was stricken with scarlet fever, and spinal trouble resulted, prostrating her for all time. Physicians have long since pronounced her incurable, and Mignonette has become cheerfully resigned. Since 1876 she has lain here, suffering agony untold—but a busy worker among the afflicted, sending out rifts of sunshine whenever possible. She directs the household and is the center of the home. A year ago her physician decided that she must give up writing and she is unable to reply to letters. With folded hands she lies quietly happy, even to be raised on a pillow being too painful to be indulged in. Though forbidden to write letters herself, she is very glad to hear from anyone who may send her a cheering note or light reading matter. Her address is Mrs. George H. Miller, Bridgehampton, N. Y. She is much loved by all who know her, for her sufferings do not make her forget words of cheer for others. When duties seem many, and pleasures few, it is well to think of the many shut-in sufferers who must endure not only constant pain, but also enforced inaction and the inability to help others. "They also serve who only stand and wait."

Rural Recipes.

From the kitchen to the dining-room
there's flour on the floor;
And imprints of floury fingers are upon
the pantry door.
Divers shattered egg-shells nestle in the
cushion of my chair,
And the odor of vanilla impregnates the
atmosphere.
But I'm not surprised or puzzled, these
are signs I can't mistake;
They are things to be expected when
Jemima bakes a cake.

—Leslie's Weekly.

Browned Mackerel.—This is a new and very nice way to cook mackerel. Freshen two fish by soaking over night, wash in fresh water in the morning and squeeze over the flesh side the juice of one-half a lemon. Lay one of the fish skin side down in baking dish and cover with dressing made of one cupful bread crumbs, one tablespoonful butter (scant), pinch of pepper, a little grated lemon peel and one-fourth cupful of cream. Lay the other fish on dressing, skin side up, and baste well with hot water and melted butter. Run into a hot oven for 20 minutes, then cover with bread crumbs, dot with bits of butter and put back in the oven till nicely browned. Carefully dish without disturbing the layers and serve with thin lemon slices and parsley as a garnish.

Buckwheat Shortcake.—This is a seasonable dish for cold weather. Two cupfuls of nice sour milk (freshly churned buttermilk is the best), add half a level teaspoonful of soda (more if the milk is very sour) and a level teaspoonful of salt; sufficient buckwheat flour to make a very stiff batter. Pour this into a buttered tin and bake immediately for about 30 minutes. Serve with butter and maple syrup.

Vanity Pudding.—Soak one-half ounce of gelatin in a cupful of water for 20 minutes, then bring to a boil. Remove and add a pint can of cherries and their juice. Set aside till beginning to harden, then add the well-beaten whites of two eggs. Make in the morning and put in a very cold place till dinner time. Serve with whipped cream and sponge cake.

Golden Johnny Cake.—Heat to scalding point one pint of sweet milk; while hot stir into it one teaspoonful butter, one teaspoonful white sugar and three-fourths of a cupful of steamed squash out of which all water has been pressed. Sift together two cupfuls cornmeal, one cupful flour, two heaping teaspoonfuls baking powder and a scant teaspoonful salt. Add to this, gradually, the milk and squash, as soon as it is lukewarm. Bake in one greased pan, or in gem pans if preferred. If it seems stiff a little more milk may be added. Bake in a quick oven. Meal varies so that it is hard to give the exact quantity.

Reprieved.

It was a mournful little procession which filed out of the barn and took its way along the lane toward the pasture. First came Azariah, with the old musket. Then followed Thad, leading a horse, tall, gaunt and aged; and in the rear, with a shovel over his shoulder, plodded old Benjamin Heminway, the owner of the farm. No one said anything, but all three of the men glanced furtively at the house, and Thad carefully steered old Prince around some outcropping ledges where his shoes would have been likely to make a noise. When they reached the pasture they halted.

"I s'pose we might's well pull his shoes off," suggested Azariah.

"Yes," said Thad. "Three of 'em's nearly new, and the other ain't much worn. I brought the hammer along."

He handed it to his brother, who took it and began to pry off the old horse's shoes. While the group was occupied with this task a voice broke in upon them. A little old lady had come quietly up the lane, and now stood nervously twisting her apron and regarding them with reproachful eyes. The men dropped the hammer and the two shoes they had removed, and stood silent and shamefaced.

"Father," said the old lady, laying her hand on her husband's arm, "you know how I've felt about this all along. The more I think of it the wickeder it seems. I just can't stand it!"

"There, now, mother, don't take it so hard. It ain't pleasant, I know, but what's a body goin' to do? He's past any kind o' work, an' it costs somethin' to keep him. Besides, the boys are all the time complainin'—"

"Well," broke in Thad, "we have to cut up all his fodder an' take milk to him every day, an' he's forever gettin' into the cornfield or the garden."

"Thaddy, it ain't what he is now but what he's been that I'm thinkin' about," said the boy's mother. "You don't remember, as I do, how he worked here on the farm year after year, an' how willin' an' gentle he always was. You don't think of the time when your father had the mail contract, and old Prince traveled his 40 miles a day, week in an' week out, Summer an' Winter; or the day when the limb fell from the tree on the mountain road, an' knocked your father senseless in the bottom of the sleigh. How long would he ha' lived in that cold, and where would you or any of us be if Prince hadn't brought him home?"

Thad was idly kicking a hole in the sod with the toe of his heavy boot, and Azariah shifted the musket uneasily from his shoulder to the ground. The old lady went on:

"Father, old Prince has done his share to help us pay for the farm. He wouldn't owe us anything for board if he lived 50 years longer, but if he's got to be killed because you think we can't afford to keep him, I've got something to say. Here's $18. It's my butter money, an' I've been savin' it to carpet the parlor with, but never mind; I'll pay for Prince's keep while it lasts, and there'll be more when that's gone."

A crimson flush crept into the old man's sunburned face. "Stop, mother, stop!" he said. "I'm a selfish brute, an' I'm ashamed of myself, but I ain't so mean as that! Old Prince has earned the right to good fodder an' good care the rest of his life, as you say, an' he shall have it, if he lives to be a hundred! Thad, Az'riah, you go put him into the four-acre clover lot; an' if either of you ever pester me again 'bout killof him, I'll take one o' them new tug straps an' make you dance livelier'n Prince ever did when he was a four-year-old."—Youth's Companion.

When you write advertisers mention The R. N.-Y. and you will get a quick reply and "a square deal." See our guarantee 8th page.

THE continual breaking of lamp-chimneys costs a good deal in the course of a year.

Get Macbeth's "pearl top" or "pearl glass." You will have no more trouble with breaking from heat. You will have clear glass instead of misty; fine instead of rough; right shape instead of wrong; and uniform, one the same as another.

Our "Index" describes *all* lamps and their *proper* chimneys. With it you can always order the right size and shape of chimney for any lamp. We mail it FREE to any one who writes for it.

BUSINESS BITS.

WAGONS that are kept well greased with Frazer's axle grease run lighter, last longer, and spare horseflesh. A box of the grease should be kept in the wagon house all the time.

W. T. WILSON, of Brownstown, Ill., says that he has dishorned 1,000 cattle with the Webster convex dishorner, and prefers it to all others. The convex is made by Geo. Webster, Box 64, Christiana, Pa.

THE Eastern Shore Poultry Yards, Parksley, Va., were established three years ago. The exhibits of these yards have captured prizes at many prominent shows, and customers report their eggs from 75 to 90 per cent fertile.

JELLIFFE, WRIGHT & Co., 284 Washington st., New York, are extensive dealers in live stock and dressed meats. Those having cattle, calves, lambs or live poultry to send to this market should write to them for quotations and shipping instructions.

IF you send five cents to C. C. Stelle, 81 Fifth ave., Brooklyn, N. Y., you will receive a catalogue and free sample of Post's improved Eureka sap spout, the kind with the air trap, that brings out more sap more days than any other device. Agents are wanted to handle these goods.

"GET something done," is the way O. S. Kelly Co., of Iowa City, Iowa, puts it in advising the use of an engine to do a day's grinding with their Duplex grinder. There is no doubt that this plan would save time and expense when the power can be had, and once done, the supply of fuel is always ready. If you wish to learn about home grinding, write these people concerning it and ask for their catalogue.

GAS and gasoline engines are becoming popular for farm power, because of economy in running, and of time in starting, and also on account of the small space occupied. To start up a steam power usually takes about an hour to get under full headway. The gas engine is ready for business in a minute or two. The Webster Mfg. Co., Chicago, Ill., make one as small as 1½ horse power. If interested at all in small power, send for their catalogue.

THE self-holding dustpan made by the Carpenter Novelty Co., Port Chester, N. Y., does away with the tiresome bending over necessary in handling the old style of dust pan. It has an upright handle 21 inches long, and is so arranged that the weight of the handle holds the front edge of the pan close to the floor, so that the dust may be swept into it without removing either hand from the broom. When not in use it may be folded in convenient form for hanging up.

THE Michigan grass seeder has for nearly 40 years been sowing such seeds as clover, Timothy, millet, flax, Hungarian grass, etc. The seed box is close to the wheel, so that little weight falls upon the operator, the walking being the only tiresome thing in its use. It will sow from 25 to 40 acres per day, any desired amount to the acre. It is entirely unaffected by the wind, so that seed can be sown whenever the ground is in the right condition, without regard to the wind or weather. The seed-box is placed on springs, permitting the wheel to pass over obstructions easily and without jar, and assuring accurate seeding on rough or stony ground. Send to Seeder & Hammock Chair Co., Homer, Mich., for prices and circulars, and one of their combined calendars and booklets.

I HAVE used liquid grafting wax made as you direct on page 37, and did not like it for the reason that it would not yield to the new growth when dry without cracking. The best wax I ever used was made as follows: Five pounds of good resin, one of beeswax and one pint of raw linseed oil; melt resin and beeswax, then add oil; cool in water and pull. S. A. E.

WHEN you write advertisers mention THE R. N.-Y. and you will get a quick reply and "a square deal." See our guarantee 8th page.

A CURE FOR ASTHMA.

Asthma suffers need no longer leave home and business in order to be cured. Nature has produced a vegetable remedy that will permanently cure Asthma and all diseases of the lungs and bronchial tubes. Having tested its wonderful curative powers in thousands of cases (with a record of 90 per cent, permanently cured), and desiring to relieve human suffering, I will send free of charge to all sufferers from Asthma, Consumption, Catarrh, Bronchitis and nervous diseases, this recipe, in German, French or English, with full directions for preparing and using. Sent by mail. Address with stamp, naming this paper, W. A. Noyes, 847 Powers' Block, Rochester, N. Y.

Cut Price Books

We have in stock some books that have not been recently advertised, and are likely to become shelf-soiled unless disposed of. Some are slightly soiled now. We are going to sell them at cut prices to dispose of the stock on hand. When any stock is exhausted, we will take it out of the list. We give the number of each on hand, and regular price as well as cut price

	Regular Price.	Cut Price.

"The Only Mail Order Drug House in the World."

"Florida and Metropolitan Limited"
BY THE
SEABOARD AIR LINE RAILWAY,
"Florida and West India Short Line"
to the Winter Resorts of the South. The Only Line Operating Daily Trains to Florida.

Effective January 14th, the Seaboard Air Line Railway, the only line operating daily limited trains to Florida, will put on its magnificent new train, "Florida and Metropolitan Limited," solid from New York via Philadelphia, Baltimore, Washington to Richmond, Raleigh, Columbia, Savannah, Jacksonville and St. Augustine. Connections at Jacksonville for Tampa and all Florida points, and at St. Augustine for the East Coast. This train also carries Drawing Room Sleeping car New York to Atlanta. Leaves Boston 12:03 A. M., New York 12:55 P. M. (from 23rd Street Station, Pennsylvania Railroad), Philadelphia 3:29 P. M., Baltimore 5:45 P. M., Washington 6:55 P. M., arriving at Southern Pines, N. C., 5:56 A. M., Columbia, S. C., 10:00 A. M., Savannah, Ga., 12:25 P. M., Jacksonville, 3:50 P. M., St. Augustine, 5:00 P. M., Tampa, 6:30 A. M., Charlotte, 9:51 A. M., Atlanta, 4:35 P. M. Connections are made both at Miami on the East Coast and Port Tampa on the West Coast, for Key West and Havana. The "Florida and Metropolitan Limited" is luxuriously equipped in every respect, with Pullman Drawing Room Car, Compartment Car with Drawing Rooms and State Rooms, Observation Car, through Day Coaches and unexcelled Pullman Dining Car service.

For further information, call on or write to all Pennsylvania Railroad offices, or representatives of the Seaboard Air Line Railway at 306 Washington Street, Boston, Mass.; 1206 and 371 Broadway, New York; 30 South Third Street, Philadelphia; 207 East German Street, Baltimore; 1434 New York Ave., Washington, or to R. E. L. Bunch, General Passenger Agent, Portsmouth, Va.

Market Briefs.

PICKED UP HERE AND THERE.

FEEDING A MULTITUDE.—In the tenement sections of New York, where as many as 2,000 people live in a single block, a new problem, how to distribute food enough so that all may get at it, comes up. It is easy to store in a small barn sufficient hay to winter 50 sheep, but suppose the flock is increased to 5,000, and there are no other storage buildings near and no places for haystacks? These people must be fed and clothed. Left to themselves their merchants have taken the common sense way of dividing up their goods into small quantities and selling them on the streets.

BACKWOODS AND CITY.—When a pioneer struck out into the wilderness the question of a market did not trouble him much. He had little to sell except skins from his hunting and trapping. He bought meat with powder and bullet; raised all the vegetables and grain needed for himself and family; and, unless attacked by disease, was independent of others. In thinly-settled sections where farmhouses are a mile or more apart, people are still to a large degree independent. In country towns they must buy nearly everything except the product of a chicken yard, a small garden and a cow. In larger towns the garden, chickens and cow are done away with, and everything is bought. In parts of great cities like the Fifth or Madison avenue residence districts of New York, houses are not crowded, and there is no difficulty in supplying them with food. The corner groceries and meat markets with their delivery wagons attend to this all right.

AN EAST-SIDE MARKET.—The Essex Market district below Grand Street is a good place to study this question. There is no large building with stalls in which the goods can be displayed. The sky is their roof, and their wares are arranged in carts or stands along the side of the streets. Within 10 blocks I counted over 600 carts, about 100 being baby carriages fixed over, revised and improved, in all degrees of repair or dilapidation. One had a box, and on top of this a second box loaded with two bushels of onions. Another held two crates of green peppers. Over 200 carts and stands were stocked with dry goods, comprising ready-made garments, second-hand linen collars, bolts of cotton and woolen cloth, and remnants and ribbons in tangled heaps. Also on some short blocks there are as many as 15 dry-goods and clothing stores. Bread and cake, fish, fruits, cheese and sausage are sold from these carts. Of course it cannot be expected that stuff left out of doors in this way, unprotected from the dirt of the street and hands of the buyer, should be clean. These people are not clean. How can they be, with their limited accommodations for washing?

HOW MARKETING IS DONE.—The common way is to go around with a basket here and there, picking out what is wanted. In one basket I saw bread, apples, potatoes and onions, and the woman was looking at some ribbons as a finisher. Another used her apron, in which was more than a peck of stuff, and she was ending up her purchases with a few eggs. I counted 125 fish peddlers. Their stock was in hand carts and boxes. One man had a novelty—live fish in a tub of water. When a customer came, he dipped the fish out with a basin having a perforated bottom, and weighed them thus. A customer stopped in front of a potato stand. He seemed in doubt as to the quality of the tubers, so the woman at the stand bit a piece out of one and invited him to do the same. A meat peddler had a lot of tripe in a washtub. Some of the tripe hung over the edges of the tub, and an old cat was vigorously chewing on one piece. Red peppers and onions are used in large quantities, and a man with a lot of garlic on a string around his neck goes about calling: "Plenty garlic! Plenty garlic!" As may be supposed, there are, in warm weather especially, odors superior in strength at least to attar of roses. One illustration will be enough. A garbage cart man brought out of a store a tub two-thirds full of rotten eggs, and poured them into the cart. People who have to live in such an atmosphere are wise to eat plenty of onions. One might think that, where so many people are crowded together, there would be a large number of fights, or at least quarrels, but there seems to be very little friction. People move around and run into each other, but take it good-naturedly. I saw one apple peddler whose cart was upset, but instead of getting wrathy he scratched around and picked up his stock without making any extra fuss.

Native Plums in Wisconsin.

PART II.

The fruiting season of the native plums may extend over a period of three months. The Aitkin, Cheney and Le Duc were the earliest, followed by the majority of the varieties mentioned, as well as many others, classed as mid-season plums. The Wyant follows these, and lasts until the late varieties of the Miner type come in, such as California, Champion, Decker's Seedling, Rose A., etc. Probably the most valuable lesson taught by the variety test is this fact, viz.: That every collection should contain a number of late varieties of this type. Long after the Americanas and Chicasaws were gone, the orchard was still reddened by the scattering trees of the varieties named. Later still than these to fruit were several trees of unknown origin, probably Myrobalan seedlings, that bore large quantities of small, bright red, shining fruits in the greatest abundance, that remained on the trees until heavy frost, and after being picked, they remained in good condition for several weeks. While the behavior of the named varieties has been a matter of great interest, the study of the seedlings has been intensely interesting and profitable work. Plums have been found in the seedling orchard excelling in many points any named variety in our collection. The most surprising fact in connection with the seedlings is the fact that the majority are good plums, as good as the parents, and a very large percentage are better than the parent varieties. In this connection the seed-bearing parent is meant, as all are undoubtedly crosses, the lack of self-fertility in the native plums having been quite fully demonstrated. Many of the seedlings showed strong evidence of a Japan cross; in fact, the best seedlings were Americana varieties with Abundance or Burbank markings. It would be unwise, however, to lay great stress on this, the first crop of the seedling trees, as further developments may necessitate a revision of opinions.

The orchards are mainly located on land that had been infested, for an indefinite period, with Quack grass. The extermination of this has proved one of the most difficult problems that we have been called on to solve. Partly on account of this pest, and partly for experiments in other directions, the main part of the orchards has been repeatedly and heavily mulched with marsh hay. There is no doubt as to the value of this method of culture, the mulched trees having made a remarkable growth of wood, as well as producing enormous crops of plums of excellent quality, while the trees not mulched made but little growth, and the plums borne were small and lacking in juiciness. The high degree of culture induced by this method possibly accounts, in a measure, for the excellent showing of the seedling orchard. It is probable that the experiment of mulching will be extended to include the entire plantation. The main objection to this plan is the danger from fire in dry weather. Four rows, 72 trees, of the new commercial orchard were destroyed by fire last Summer, and it was only by heroic efforts that the remainder was saved.

One of the faults of the native plums is the tendency of most varieties to overbear. In order to have fruit of good size and quality it is usually necessary to thin it. During the second week in July the fruit was thinned on all trees that appeared to be overbearing. At this time the plums were more than one-half grown, and the work probably could have been done earlier with greater profit. It is better, however, to thin late than not to thin at all. Of two trees of Hammer that were overlooked at the first thinning, and were breaking down with fruit, one was thinned September 1 after the fruit had begun to color; on September 15 a marked difference could be noted in the size of the plums in favor of the thinned fruits. The plums that were pulled off ripened on the ground, and were salable as "seconds."

The earlier plums were marketed in berry boxes, and the later in baskets holding one-sixth of a bushel. The berry boxes will probably be discarded in future in favor of the baskets. Only very choice plums suitable for dessert use can be sold in this shape for a price large enough to be profitable. The bulk of the crop was sold at $1.50 per bushel, wholesale prices, or 25 cents a basket. These sold at retail for 35 and 40 cents a basket. The price might as well have been held up to $2 a bushel, as the demand far exceeded the supply at all times. Early plums have not been in so great demand as the mid-season and late plums.

F. CRANEFIELD.
Wisconsin Experiment Station.

A TOUGH PROBLEM.—A subscriber sends us this little note: "I asked a man yesterday to subscribe for THE R. N.-Y. He said he did not take much stock in these papers; one of his neighbors wanted him to take one he liked, and gave him a sample. The first thing he read was how many kernels of corn to plant in a hill, and he had been planting corn for 50 years, and up went his nose. What can one do with such a man?" Keep right at him! Tell him the world needs his information, for he seems to know it all. It is no sign that a practice is right because a man has followed it for years! Age may fatten wrong!

WHEN you write advertisers mention THE R. N.-Y. and you will get a quick reply and "a square deal." See our guarantee 8th page.

The White Man's Burden

can be named in the single word—*dyspepsia*. It is the one disease, which more than any other, affects the American people. It is common to all classes and all conditions. It makes life miserable. It mars family happiness. It interferes with business and pleasure alike, and it discounts a man's usefulness just as much as it discounts his happiness.

There's a remedy for dyspepsia. Dr. Pierce's Golden Medical Discovery has lifted this burden from the bodies of hundreds of thousands. It cures ninety-eight out of every hundred who give it a fair and faithful trial.

"I used ten bottles of Dr. Pierce's Golden Medical Discovery and several vials of his 'Pleasant Pellets' a year ago this spring, and have had no trouble with indigestion since," writes Mr. W. T. Thompson, of Townsend, Broadwater Co., Montana. "Words fail to tell how thankful I am for the relief, as I had suffered so much and it seemed that the doctors could do me no good. I got down in weight to 125 pounds, and was not able to work at all. Now I weigh nearly 160 and can do a day's work on the farm. I have recommended your medicine to several, and shall always have a good word to say for Dr. Pierce and his medicines."

Free. Dr. Pierce's Medical Adviser is sent free on receipt of stamps to pay expense of mailing *only*. It contains 1008 pages and over 700 illustrations. Send 21 one-cent stamps for the book in paper covers, or 31 stamps for cloth binding to Dr. R. V. Pierce, Buffalo, N. Y.

Cider Machinery.—Send for catalogue to Boomer & Boschert Press Co., 118 West Water St., Syracuse, N.Y

How to Drain Land Profitably.

On every farm there is probably some land that could be made more productive by underdrainage. Properly drained land can always be worked earlier, and more profitably. The ROUND TILE best and most economical way to drain is explained in the book, "Benefits of Drainage and How to Drain," which is sent *free* by

JOHN H. JACKSON, Third Ave., Albany, N. Y.

ISN'T THAT ABOUT RIGHT?

8 wires, 24 inches high, for a Hog Fence? Or better still, 9 wires, 30 inches high? That's PAGE.

PAGE WOVEN WIRE FENCE CO., ADRIAN, MICH.

The Farmer

Can Reduce Expenses

of cultivation by the judicious use of

Nitrate of Soda

upon his land. This when properly applied, with other elements of plant food, never fails to largely increase the yield of hay, grain, or garden crops, without additional cultivation or labor. Our literature and ***list of dealers*** in *Nitrate of Soda* will be sent free on application to **John A. Myers**, 120 John St., New York City.

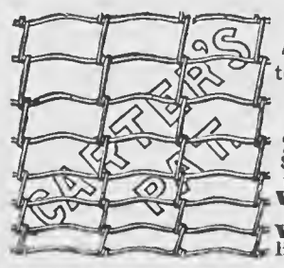
BE A BEE KEEPER.

Fascinating and profitable occupation. Our Semi Monthly Magazine,

GLEANINGS IN BEE CULTURE

tells all about it, so that beginners understand how to handle bees and make money. Sample copy and books on Bee Culture and catalogue of all Bee Supplies free if you mention this paper. We are the leading manufacturers of everything for bee keepers.

THE A. I. ROOT COMPANY, MEDINA, OHIO.



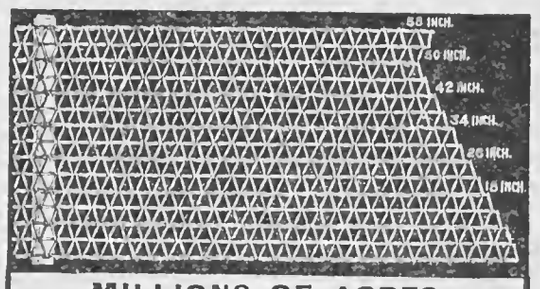
A MACHINE

to weave your own fence of Coiled Hard Steel Spring Wire. 52 inches high, at **25 Cts. per Rod.** $25 buys wire for 100 rod fence. Agents Wanted. Catalogue Free. CARTER Wire Fence Mach. Co. Box 23 Mt. Sterling, O.

LIGHT TIE WIRES SOON BREAK.

Fence should have upright wires at least as heavy in gauge as the lateral wires. The FROST contains all heavy wires, thoroughly galvanized. Send for new 20th Century catalogue.

The Frost Wire Fence Company, Cleveland, O.

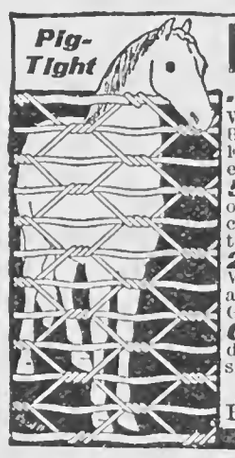


MILLIONS OF ACRES

feneed with them this year. Thofences that grow moro popular every season. Real saving, servieo and satisfaction in

Ellwood Steel Wire Fences

Fully guaranteed. Best steel and galvanizing. If you can't find our local agent write to American Steel & Wire Co., Chicago or New York.



HORSE-HIGH!

... BULL-STRONG ...

With our **Duplex** Automatic Ball Bearing Woven Wire Fence Machine, any farmer can make 100 Styles, and from ***50 to 70 rods a day*** of the best and most practical fence on earth at a cost for the Wire to make it of from ***20 to 30c. per rod*** We sell Ornamental Fence and Gates, Farm Fence and Gates, Plain, Barbed and ***Coiled Spring Wire*** direct to the farmer at wholesale prices. Catalogue free.

KITSELMAN BROS.
Box D 92. ***Muncie, Ind.***

Important to Horticulturists, Nurserymen, Etc.

TO INSURE NURSERY STOCK against San José scale and all other insect pests, practice the new and cheap system of fumigation, described in the American Agriculturist weeklies February 16, by the associate editor, Prof. W. G. Johnson, late state entomologist of Maryland. Other important articles to follow by the same and other authorities.

SPECIAL HORTICULTURAL NUMBER March 2. Every seedsman, nurserymen, florists, or commercial horticulturist should subscribe, to get the latest and best horticultural matter from the most experienced and ablest authorities. They will also find it a most valuable advertising medium, going as it does to nearly all the commercial horticulturists, truckers, orchardists, etc

A SUGAR BEET GROWERS' CONTEST, with thousands of dollars in prizes, we are conducting for 1901.

Only reliable advertisements admitted, such as we can guarantee our readers they may safely do business with. Circulation last year 9,513,625 copies almost a **million a month**. For advertising rates, maps showing actual subscribers in each state, and sworn details of circulation each week of the year, reports of those who have made money by advertising in these mediums, address either of our offices, correspondence invited.

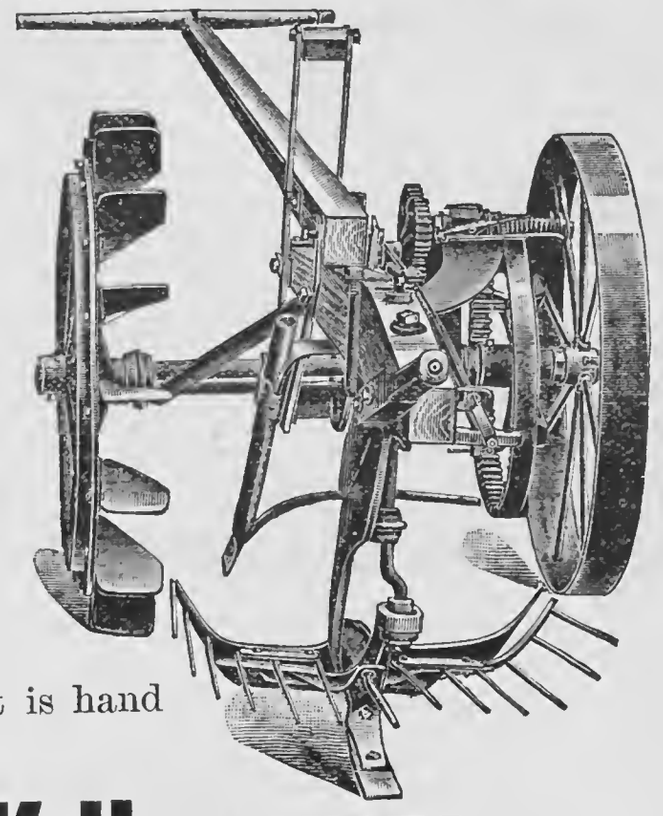
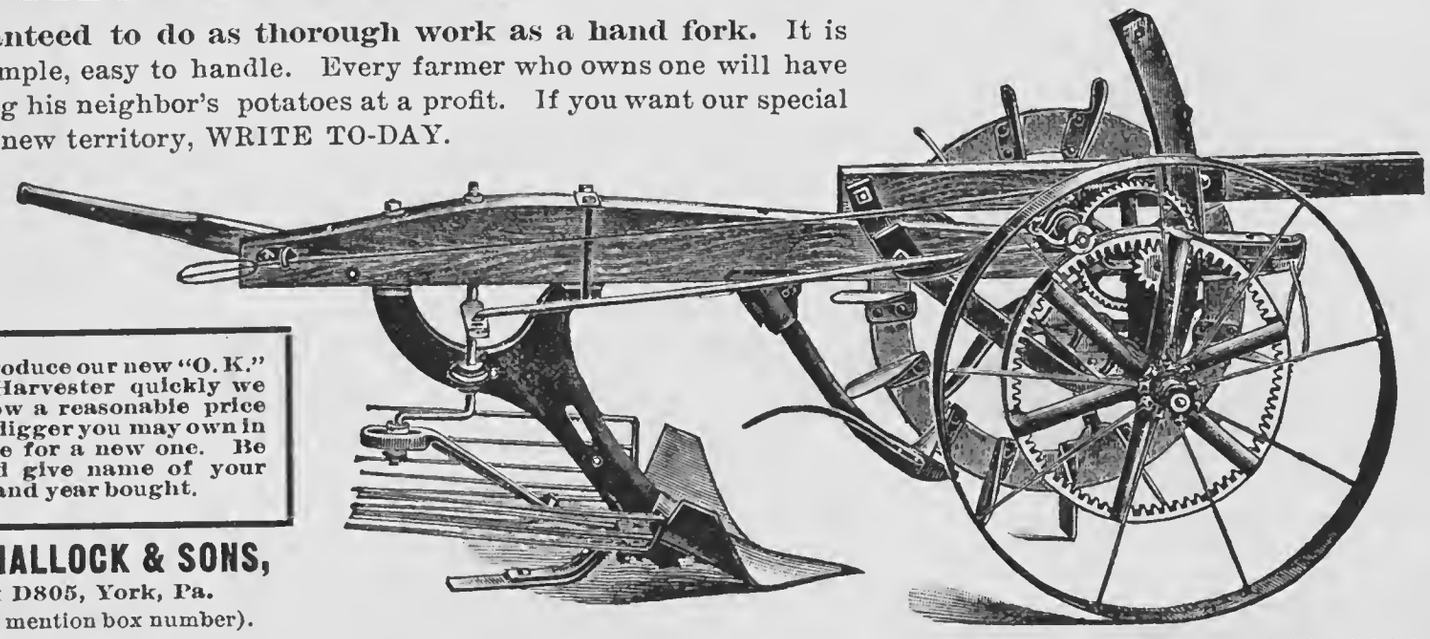
GOLD
s made in using Nagley's Transplanter, in transplanting Cabbage, Tobacco, Sweet Potatoes, Celery, Sugar Beets, Turnips, Tomatoes, Strawberries; also used on Sprouts and in planting Potatoes. Absolutely guaranteed to do the work. Capacity, 4 to 6 acres per day. Lightest, cheapest and easiest operated machine made.
THE NAGLEY MFG. CO., Lyons, N. Y.

A ROOFING FOR YOUR POULTRY HOUSES
should be absolutely air-tight, to protect the chicks from cold draughts, and proof against dampness, to keep them dry. That is one reason why
P & B RUBEROID
Roofing is so generally used by poultry raisers. Another reason is that it is so easily applied. No experience is necessary. You furnish the hands and hammer. We supply the other necessaries. Ruberoid will not melt, tear or rot. It is a study in economy.
THE STANDARD PAINT CO.,
Nos. 85-87 John Street,
NEW YORK.

60,000 Potato Growers
should write to us in the next ten days to get our wonderful offer for quick orders and introduction of Hallock's "O. K." Potato Harvester. If you've been waiting for a perfect digger—**here it is.** If you have an old digger on your hands we will take it in trade. Get an "O. K." and ask your neighbors to watch it dig. The price is right, the draft is right (one team). The digging is done as clean as a man could do it with a fork. It is hand work for thoroughness, team work for speed.



HALLOCK'S "O. K." POTATO HARVESTER
is guaranteed to do as thorough work as a hand fork. It is strong, simple, easy to handle. Every farmer who owns one will have calls to dig his neighbor's potatoes at a profit. If you want our special terms, in new territory, WRITE TO-DAY.



To introduce our new "O. K." Potato Harvester quickly we will allow a reasonable price for any digger you may own in exchange for a new one. Be sure and give name of your digger, and year bought.

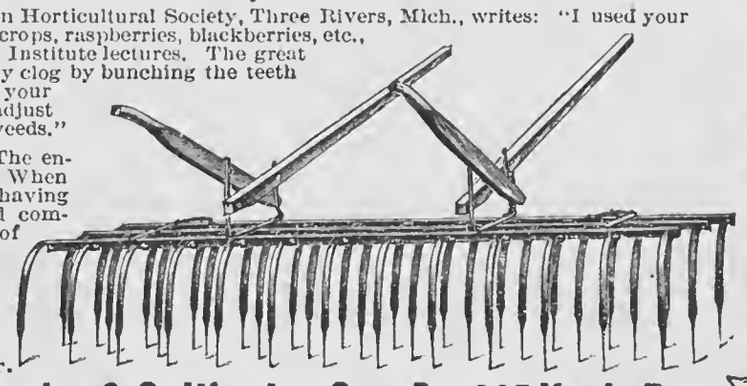
D. Y. HALLOCK & SONS,
Box D805, York, Pa.
(Please mention box number).

Your Success with Small Fruits
will surprise you this season if you stir the soil with a "Success" Weeder. The flat tooth of spring steel is the secret of its thorough weeding and surface cultivation. No other weeder has, or can have, this patented feature. No other weeder is "Anti-Clog." Growers who have used the "Success" Weeder on strawberries say it is better than a thousand pounds of fertilizer to the acre. It keeps the ground in perfect condition with the least possible labor. You get larger crops of finer fruit by using

Hallock's "SUCCESS"
ANTI-CLOG WEEDER AND CULTIVATOR
There is not a crop on the farm you cannot improve by using the "Success" Weeder, and save half the cost of cultivation. See what some folks say:

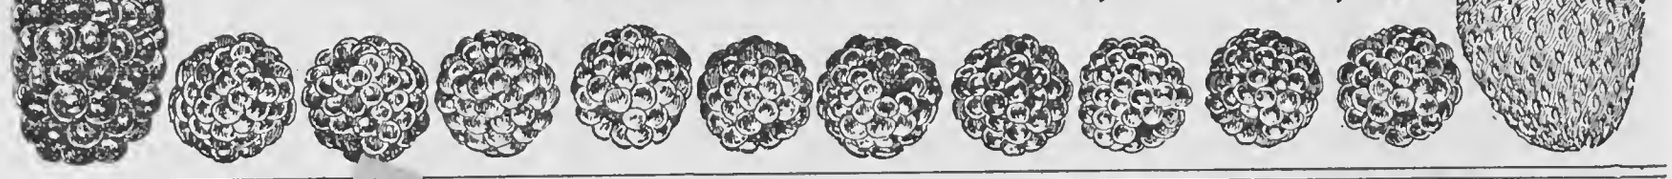
R. M. KELLOGG, President of the West Michigan Horticultural Society, Three Rivers, Mich., writes: "I used your "Success" Anti-Clog Weeder on all spring planted crops, raspberries, blackberries, etc., and heartily commend it to the farmers in all my Institute lectures. The great trouble with the round tooth weeder is they readily clog by bunching the teeth together whenever they strike a hard spot, while your style of flat spring tooth causes them to quickly adjust themselves so as to completely kill all the little weeds."

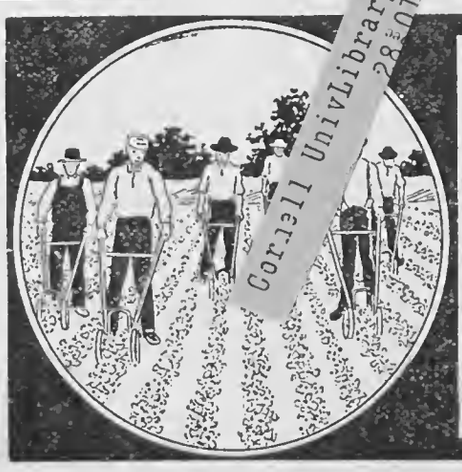
ALFRED CHALMERS, Vineland, N. J., says: "The enclosed photo shows my two acres of strawberries. When first set I worked it both ways with the weeder, having all the teeth in. Later on when the plants had commenced to run I used the weeder, taking off part of the teeth. These plants have had no fertilizer of any kind and are cleaner and of better growth than any I know of, and this is a good strawberry section."



Every mail contains praise for "Success" Weeders. **Write for all the facts about them, with prices and special introductory offer.**

Please mention box number. **Hallock Weeder & Cultivator Co., Box 805 York, Pa.**





Easy and Profitable Gardening.
The thoughts of back-breaking, hand-hoeing and weeding prevents many a man from making money out of a garden. The easier, surer and better way is to use one of our *"Planet Jr." Double Wheel Hoes.* They cultivate perfectly all garden crops, astride or between the rows. Throw the dirt to or from the row; cultivate the middles; break up the crust and level the surface. They plow, turning furrow either right or left, hill up and furrow out. Have attachments for all this work. Adjustable to any width of row. Strong, durable and lasting. Every attachment of best hardened polished steel. Then, too, they are so easy to handle; children use them readily.

Our 1901 Catalog (edition 350,000) illustrates and fully describes these and our full line of "PLANET JR." Hill and Drill Seeders, Wheel Hoes, Horse Hoes, Cultivators, Two-Horse Cultivators, Sugar Beet Seeders and Cultivators, etc. Prices greatly reduced for 1901. But send and get a free copy of the catalog and learn all about "PLANET JRS." and how they are used at home and in foreign countries.

VOL. LX. No. 2665. NEW YORK. FEBRUARY 23, 1901. $1 PER YEAR.

SAN JOSE SCALE AND CRUDE PETROLEUM

A GREAT INCREASE OF THE SCALE.

Facts About the Use of Petroleum.

SCALES INCREASING.—The demand for Bulletin No. 146, of the New Jersey Experiment Station, treating on the above subject, has been so great that the edition is completely exhausted. Since the work was published much additional information has come in, and a very large number of oil samples have been received from all parts of the eastern oil territory. In no previous year in my experience has the scale bred so rapidly, late in the Fall, as in 1900. Ordinarily, while breeding does not cease by the middle of October, it is so much lessened that the condition then existing may be fairly recorded as that in which the tree goes into the Winter. In October, 1900, larvæ swarmed in countless multitudes, and continued to increase, favored by the warm, dry weather, far into November. In fact on my experiment trees, larvæ were yet active far into December. The result is a much greater infestation and a greater spread than in previous years. As an example I may cite a peach grower in Hunterdon County, N. J., who offered $1 to anyone who could show him a scale in his orchard in August. In October he had no lack of infested trees, and in January he told me that the increase had been so great that he feared that many of the trees were doomed; so utterly coated with scale were they. A tree on my own place offered a similar example; only a little scaly in midsummer, it was not only coated in December, but the entire inner surface of the bark and bast was purplish red. Of course I might have checked this by timely spraying, but I preferred to let things go as 99 out of 100 fruit growers would do under similar circumstances.

SOME RESULTS.—As a result of this abnormal season many fruit growers did not get the results from spraying that they should have done. The inevitable few left-overs placed matters in much the same condition that they were the year before; a discouraging feature, to say the least. Those who successfully used crude oil were in much better position than those who used soap or other mixtures, provided the mixture was strong enough. For instance, in Hunterdon County, N. J., at an experience meeting, one grower informed me that he had used a 15-per-cent mechanical mixture in the Winter of 1899-1900, and had then, January, 1901, as much scale as he had the year before. The man sitting next to him had used a 25-per-cent mixture liberally and had practically no scale left. A correspondent from Lakeside, O., who has published his experience elsewhere, wrote in November that he had "used the kerowater sprayer, set for 25 per cent of crude oil, and sprayed from April 6 to April 20 at intervals, as weather would permit, on peach, plum, apple and pear trees. May 12 and 13 used 15 per cent of oil on above varieties of trees, and May 17 and 18 used 10 per cent of oil on peach, plum and apple trees with no bad results, except the loss of about one per cent of foliage on last dates. I am unable to find any live scale on trunks or large limbs, where 25 per cent of oil was used; but there were some spots on some trees that were not hit with the oil, and that left live scale to multiply; but they are all on these spots, and on this season's growth of outer branches. All trees treated with fish-oil soap, two pounds to the gallon of water, still have the scale scattered all through them, probably as many as before treatment with the soap. I have arrived at this conclusion after this year's experience: I can keep the scale in check at least, if not wholly eradicate it with crude petroleum at little expense; but with fish-oil soap we can spend all the money and time we have a mind to, and have the scale as long as we live. Think I am safe in saying we can kill more scale with $25 worth of crude petroleum than with 100 worth of fish-oil soap. My brother used undiluted oil on a block of two-year-old peach trees and it killed them."

THE BABY PRIMROSE (PRIMULA FORBESII). FIG. 48. SEE PAGE 128.

DIFFERENCE IN OIL.—The last sentence was not so satisfactory; but I secured, as the result of correspondence, 13 one-pint samples of Ohio crude oils, not one of which reached 40 degrees, while the majority ranged between 35 degrees and 37.5 degrees. All were black or dark oils, and none of them compared with the Pennsylvania or West Virginia green or amber oils in fluidity. They were unfit for use undiluted; but can be safely used in a 25-per-cent mixture. Of course, when my bulletin No. 138, which was followed by these gentlemen, was published, neither I nor anyone else had any idea how important for its effects upon the tree was the specific gravity of the oil. From Martinsburg, W. Va., I heard in December: "I advised the test here on the Janney orchard, which was the worst infested. They have showered it with crude oil, have checked the scale and hurt no tree. Where the work was thorough the scale was eradicated."

A correspondent writing from Hammonton, in south Jersey, late in November, stated that he had used five barrels of crude oil the previous Winter, undiluted, and mostly on Bartlett pear trees in February. "I did not harm a single pear tree; but think it improved their growth, especially in one young orchard, that has not been growing as well as I thought it ought to under the cultivation that I have been giving it for three or four years. Last Summer the trees made the most growth of any season. We were told here four or five years ago by a young man traveling through the country lecturing on the scale, that the San José scale would not move over one inch in the whole Summer season. One year ago last Winter (1898-'99) when I went over my pear orchard, trimming and cutting out dead wood, I watched for scale, and did not find above a dozen trees that were infested, and those I treated with potash whale-oil soap. Last Winter (1899-1900) when I went over them again, I was greatly surprised to see the rapid progress they had made in one year. Many of the trees were literally covered, and they had scattered all over the orchard of about 1,200 trees to such an extent that it was not safe to undertake to pick them out, but to spray thoroughly; I holding the nozzle myself. I only made one application, and now find but very few scale. I painted a few peach trees with some of the same petroleum that I sprayed the pear trees with, and it killed several of the trees. Mr. G. tells me he painted his young peach trees with crude petroleum and did not kill a tree."

I obtained from Mr. G. a report of his proceedings as follows: "Herewith I send inclosed two pictures of peach trees. No. 1 will be two years from the nursery, in my orchard of 200 trees set November 22, 1898; treated last Winter with crude petroleum by brush and brushed thoroughly. No. 2 is one-year-old, cut back to a stick set last November, was treated at the same time and in the same way. The branch on the right is seven feet long and was pinched to retard growth." I secured a sample of the oil that had killed the peach trees mentioned in the first report, and found it decidedly below requirements as to specific gravity; but as it had been standing for almost a year it may have lost by evaporation. These reports from the same place, on applications made in apparently the same way, with opposite results, are confusing, and point to the possibility of factors not yet known, which influence the action of the oil. Reports

of good and bad results should therefore be as detailed as possible, that the reason for such results may be determined.

SOME GOOD RESULTS.—There is danger when a man is too successful, as was a correspondent in Swedesboro, N. J.; he wrote in December: "My experience was, wherever I used it last Spring there was a marked difference in the vigor of the tree. The foliage acquired a dark green, observable at quite a distance, and which difference was greater as months passed by. It did not cease there; but the fruit gave an equal response. It is true that the oil was applied so late that the buds were in some cases injured, thus causing a smaller number of fruit to remain on the tree than there would have, otherwise; still, in no case were the trees so healthful and the fruit so good as where they were sprayed. I finished trimming my peach trees to-day, and my attention has been continually called to the marked difference in the quantity and vigor of fruit buds, and also healthy fruit spurs. From my experience for peaches I think that the oil should be used in February." My difficulty with this man is to prevent him from oiling everything he has on the place, irrespective of whether there is scale or not. Nevertheless his conclusion concerning the time for treating peaches is nearly correct. February or early March is the best time. Finally comes a New York experience, from Poughkeepsie, dated December 14: "I used 250 gallons of crude oil last April, 20 per cent to 25 per cent, with kerowater pump, on 1,000 apple trees 10 to 17 years old, large and thrifty, without harming a single twig. A wholesale slaughter of scale followed, and there is certainly not one-tenth as much scale in my orchard as a year ago. Success depends upon careful distribution with the right nozzles, pumps and men. I used a double Vermorel with orifices a little enlarged, so as to do rapid work with large trees." Now a word further, concerning apples: Ordinarily they are resistant to applications of poisons; but with crude oil the results have in some cases been more unsatisfactory than with peaches. Some growers have killed certain varieties which with others have not been in the least harmed; while the varieties that one treated safely were fatally injured by another. Pears stand the oil with almost uniform safety.

ADVICE.—Crude petroleum is a new thing; it is an exceedingly effective insecticide, and in my own hands has been entirely safe on all kinds of trees. To fruit growers generally my advice is use it boldly but carefully. Never treat a tree that does not need it, and never waste the oil. If you are in the least doubtful concerning your oil, or the man who is to apply it, use it in a mechanical mixture. Personally, on all trees to be treated by myself, I would apply it undiluted. The 25-per-cent mixture has proved successful in so many hands that it seems almost as efficient as the undiluted oil, and I have no record of injury from such a mixture. It must be recollected, however, that it is the *oil* which is the killing agent. There must be oil enough to cover every part of the tree; the water serves merely to spread the same amount of oil over a greater surface. If you spray a pint of crude oil undiluted on one tree and two quarts of a 25-per-cent mechanical mixture on another of the same size, you have done exactly the same thing, and the results should be similar. If it needs a pint of oil to cover the tree well you must put that much on, either with or without water; otherwise you will not get the desired result. I admit that the average man can do more even work with two quarts than with one pint and will be less likely to put on an excess.

In using the mechanical mixture keep the pump going as steadily as possible, as at every pause there is a tendency for the oil and water to separate in the hose, in the pump and in the air chamber. Every new start is apt to be either clear oil followed by clear water, or the reverse. Hence, it is better to waste a little going from tree to tree than to stop down every time, and risk putting on too much oil or ineffective water. To oil buyers in the Southern States the caution as to grade of oil is especially addressed. A sample which has just reached me from Alabama has a specific gravity of only 32.5 degrees, and looks almost black, as if from an asphaltum base. The Texan gusher, which has been recently developed, produces an asphaltum-base oil and some of that may have got into the southern market. It may be good, but I know nothing of it, and it should be employed experimentally only. JOHN B. SMITH.

New Jersey Exp. Station.

POTATO SEED-BALLS.—I have been able to save some seed from Rural New-Yorker, Carman No. 2, and Sir Walter Raleigh potatoes. I had a piece of ground on which the snails ate up all the beans I planted, and was replanted to these potatoes mixed, as I had supposed my plantings were over. About 50 feet of the four rows were in the shade of large oak trees; 300 feet more of the rows received no shade. While many imperfect balls formed on the 300, only perfect balls were found under the shade of the trees; about a dozen fully developed ones. I have about 20 seedlings from these varieties grown last year; all show the true type. Some of them produced tubers the size of peas before the plants were three inches high in the seed pans. S. T. W.

Oregon.

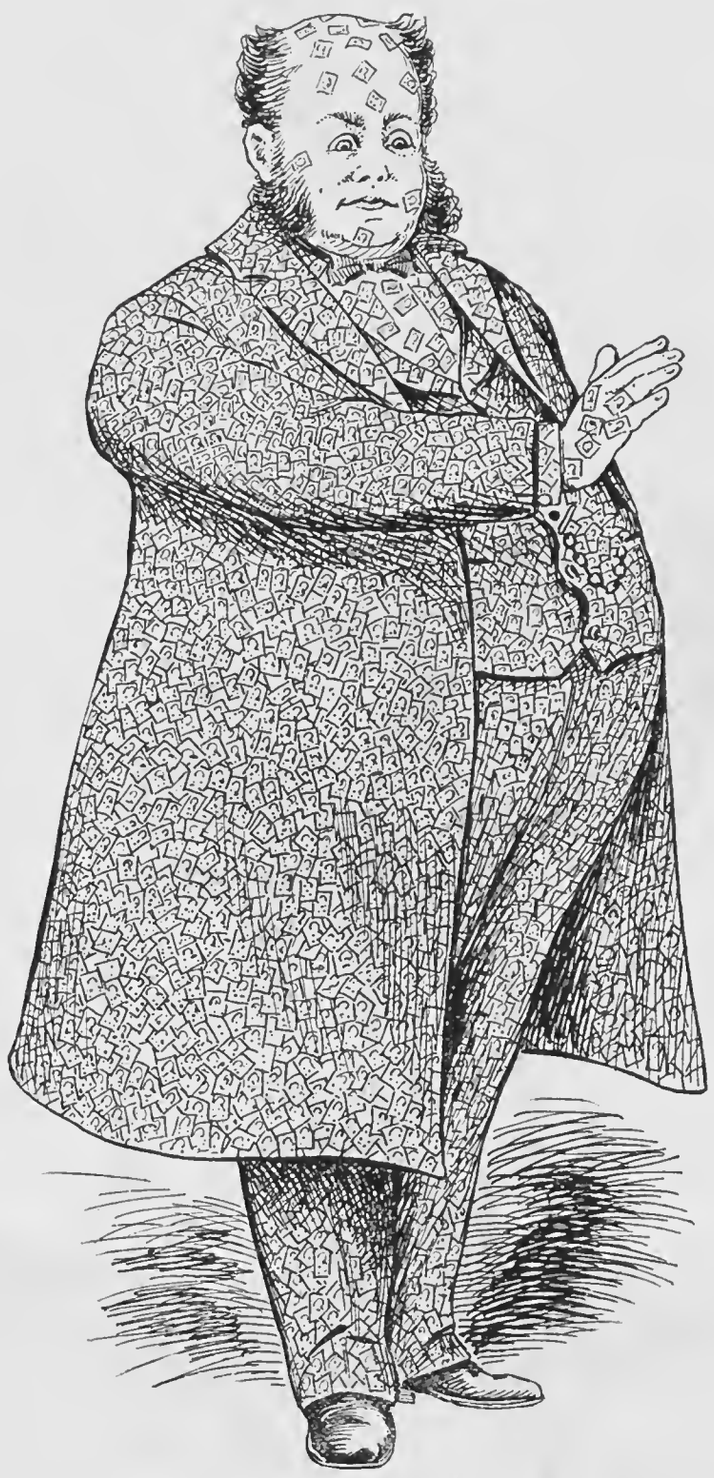
CLOVER FARMING.

MANAGEMENT OF CLOVER IN THE MISSISSIPPI VALLEY.

The Great Value of the Plant

PART I.

ITS HISTORY.—It would seem that clover as a feed and fertilizer has been discussed and experimented with so long, and over so wide a range of territory, that little new could be said about it. It was used in England nearly a hundred years before any of the cultivated grasses, and even then it was an old plant, having been used by the Greeks and Romans more than 2,000 years ago. I have been using it in my rotations for more than a quarter of a century in the Miami Valley. In that time we have tested Medium Red, Mammoth, Alsike, Crimson and Alfalfa, and have seen waste lands overrun with Melilot for miles around a farm of a German, who brought the seed from Germany 22 years ago. Of all these varieties we have found the common or Medium Red, the most satisfactory. It makes a liberal growth of top and root, and has a larger per cent of leaves and branching stems than any of the other varieties, excepting Alsike. It makes better hay than any other for this reason, and there is less waste in feeding. As a fertilizer it has no superior, since its chemical constituents are practically the same in all, and the Medium covers the ground more evenly than the Mammoth, but not so heavily when in full growth. It suits our rotation, of clover, corn and wheat, better than the Mammoth, as we use it for pasturing hogs, cattle and sheep, and for making hay and seed.



"THE BRAND OF THE POSTAGE STAMPS!"

How the average Senator looked after the honest-butter letters began to come from farmers.

The Mammoth makes a heavy growth, and if one has stock enough to pasture it evenly before the middle of June, and then allow it to mature the seed, it is a superior crop for increasing the fertility, as it shades the ground so long, and casts so many leaves to rot and favor nitrification, and with the stems and root-growth there is added an immense amount of vegetable matter, as much as is needed to turn under for any future crops in a rotation of three or four years. But it matures the seed so late that the weeds have matured seed, which fact makes clean farming more difficult than where we use Medium Red clover. The Medium Red is cut for hay in June, and the weeds of early Summer are destroyed, whereas the Mammoth cannot be so handled.

CLIPPING CLOVER.—To promote clean farming, and to increase the branching growth of the Medium Red it has been our custom since 1875 to run the mower over the wheat or barley stubble in August or September before weeds have had time to mature seed, after the grain had been harvested. The grass-board is taken off the mower, and it is set to cut within three or four inches of the ground. The weeds, stubble and clover tops are thus evenly spread and left as a mulch that adds to fertility. This process thickens up the clover, making it more branching, and cleaner for hay or pasture the coming season. As a rule, we never pasture the clover the first year, as our late Summer and early Fall is usually dry, and taxes the young clover on thin places. Occasionally, where wheat is cut late, and the weather hot and soil dry, young clover perishes on thin land. But this is rare, if the seed is sown early, and the land is in good condition. Where a soil is lacking in a sufficient supply of humus, it dries more readily and the young clover is short of moisture. Barley is the best crop for clover to follow, as it comes off in June, when we are likely to have showers. One good shower after harvest, will generally insure the young clover from damage, while a few days of intense heat and drought after wheat, rye or oat harvest will greatly damage the young clover. At such a time farmers are usually short of other pasture, and few can resist the temptation to turn all their stock into the stubble. They see their mistake the following Spring, if not sooner, when the clover has failed to survive the Winter.

TIME OF SOWING.—As to time of sowing clover I do not think there is any sure time, although it may be called a very reliable crop if good seed is sown on good soil any time between February and April. Early seeding favors deeper rooting before dry, hot weather. In fact, I have found that clover will grow at any time on good soil, where the supply of moisture is ample. The presence of plenty of moisture in early Spring makes this the most reliable time. It is with Red clover, as with Crimson, necessary to consider well the conditions of soil that favor germination and growth. I have sown Crimson clover at seven different times in the season, and find it a very sure crop, sown the latter part of June, as the soil moisture is then ample to favor germination and strong rooting. Common Red sown beside it does as well, whether sown in June, July, August or September, but sown later than August neither gets strong enough, even in very favorable seasons, to survive the Winter, and both are almost sure to fail if the season is dry and hot. Success with clover means a sufficiency of moisture.

SOIL MOISTURE NEEDED.—Because of the need of moisture we must put the ground in tilth to retain moisture. Farmers have so long trusted to getting the seed covered by the frost or rains that they have not given it as good a chance as they have their oats, wheat and barley. This trusting to nature to cover the seed has led to the custom of sowing only in the freezing and thawing season. Talking with a friend about my tests of Crimson clover and the prime requisite of success, he said that the same is true of our old friend, Red clover. He asked why we cannot sow Medium Red clover after we lay by corn, and have clover to turn under the next Spring. I told him that we can if we secure the moisture and then cover the clover seed. He has since tried it, and claims that clover thus tried is as sure a crop as wheat or barley. Just how deep clover will bear covering I do not know, but to get a stand in June or July it is as necessary to cover Medium Red as Crimson, and for the same reason. So valuable is clover for feed and improvement of soil, that we can afford to give the seed a better chance than is customary. Why our Medium Red clover does not grow as well in New Jersey, Delaware and other States where Crimson clover does well is, I suspect, partly due to shortage of moisture in the surface soil. We find it harder to get a good stand on soil that is so sandy that the surface dries quickly. On such soil harrowing with a Thomas harrow, and then rolling after seed is sown, secures a stand, where failure is almost certain without it. I think farmers too often expect too much of clover. They want it to grow and make rich land where wheat, barley, oats and even beans will not grow. Such soil is as truly wheat-sick and oat-sick as "clover-sick." If on such a soil wheat is secured, it follows fertilizing and thorough cultivation. To secure a stand of clover we can afford to give as much care to preparation for it as we give for wheat. L. N. BONHAM.

Butler Co., Ohio.

SOUTHERN VEGETABLES.—Of late years the business of raising early fruits and vegetables in the South for shipment to northern points in Winter and Spring has been on the increase, and it is probable that, if careful methods of marketing are used, the business might grow to much larger proportions without danger of overloading the northern markets. It has been found that farmers' associations in the South, when handled by men of common sense and business ability, have been a material help in solving the marketing problem. The main point seems to be to furnish good stuff and make connections with honest, hustling dealers in the distributing markets. Honesty and intelligent work at both ends of the line are necessary. Most of the failures may be traced to poor produce, faulty methods of packing, or lack of care in selecting selling agents in the North.

THE INDIVIDUALITY OF PLANTS.

The season of Spring planting is approaching; seeds and plants for the year's work must soon be obtained. Whence shall they come, and what shall they be? To select varieties possessing the characteristics which we seek, and which are adapted to our own conditions, is important. Something more is important. All plants of a variety are not alike. In vegetables and grains, which reproduce themselves from seed, there is constant intermingling of plant with plant, tending to induce variation in the offspring. With fruit plants, propagated by the bud in some form, it would seem that this tendency should not hold. If every plant of a given variety is in one sense a part of the parent seedling, separated from that parent, why should it not maintain all the characteristics of the parent? Observation shows that it does not do so. Plant substance is not unchangeable; it responds in greater or less degree to varying conditions of environment. The plant subjected to a dry climate must adapt itself to that climate or perish. Propagation from that plant carries with it something of the acquired characteristics. Scions from a tree growing in a soil so heavy and rich as to induce unfruitfulness may transmit something of that characteristic to a tree grown under better conditions. Heredity and variation, or the attempt of the plant to adapt itself to conditions, are thus two factors which may work in opposition. Improved conditions may improve inferior plants. Heredity will tend to prevent that improvement. Unite the two factors by selecting plants from a parent possessing the desired qualities and giving it better conditions and progress should be rapid, since the two forces act in unison instead of in opposition.

On the grounds of the Rhode Island Experiment Station, in the Summer of 1900, five plants of Kansas raspberry were selected as the fruit began to ripen. The plants chosen were the five most desirable ones in the field, so far as the eye could determine. A record of the fruit obtained from these plants was kept. One plant yielded 648 grams of fruit and another yielded 1,130 grams. On the plant which gave the lowest yield the fruit averaged 1.13 grams in weight; on the other plant it averaged 1.33, on a third, yielding 1,117 grams, the average weight was 1.43 grams. If such variations appear between plants chosen as the best it is evident that there must be much greater differences between the best and the poorest plants in the field. This difference may not all be due to the individuality of the plant, but much of it must be. Certain it is that everyone would rather have plants produced from the one which bore the higher yield of larger fruit than from the one which bore the lower yield of smaller fruit.

Reports of strawberry plants kept in 1899 showed equally marked variations. To illustrate, one plant of McKinley produced 239 grams, another 661, more than 2½ times as much. One plant of Glen Mary produced 286 grams, another 756, again more than 2½ times as much. One plant of Crescent produced 121 grams, another 601, nearly five times as much. Recent studies of the wilt disease of cotton, made in the South, show remarkable results in securing plants resistant to the disease by selecting seed from parents which resisted. Similar attempts to secure potato plants resistant to blight, made in Rhode Island, have shown less remarkable but decided results. The lesson from all this is obvious. To secure the best results the offspring of the best individuals should be planted. The poultryman or stock-breeder knows that breed in itself means little; he must know the pedigree and characteristics of the animal within that breed. Should the plant-grower do less?

FRED W. CARD.

ABOUT THE NEW STRAWBERRY CULTURE

Mr. Farmer's plan of "trenching in" his strawberry plants I fear might not answer if the early Summer happened to be very dry. I should not like to postpone setting for two or three weeks, even if my plants had a nice bunch of new roots, and after last year's experience I do not feel sure of these new roots starting out. After setting my piece I put out a number of hundreds in just the manner described by Mr. Farmer, expecting to use them for filling in after the White grub had dined. They were in fairly moist land, and stood up well, but when I examined the roots I was surprised, for there was little or no new growth. This was later in the season than Mr. Farmer would have kept them for setting out, being perhaps July 1 to July 10. I considered them worthless, and left them where they were the entire season. None died, and quite a number of runners were sent out, but, of course, nothing was expected in their crowded condition. I should have thought myself unfortunate indeed if I had been obliged to use such plants. I am quite sure air did not get among the roots, as the soil was pressed hard. I neglected to state that they were set out about May 23, which is a week or 10 days later than we usually finish setting. This may be of some importance, though I considered them at the time excellent plants. J. W. B.

Massachusetts.

DIGGING AND PITTING POTATOES.

The farmer who has several acres of potatoes to dig late in the Fall is often confronted with a scarcity of help. Sometimes an early freeze ruins a portion of the crop. Many potato growers plant late varieties about the first week in June. This allows the small tops to take on new growth after the Fall rains, and the tubers generally are larger, and of a

HERMAPHRODITE WHITE WYANDOTTE. Fig. 49.
See Page 133.

better quality. In this section late planting of late varieties usually insures a much larger yield. With good loamy soil, fairly fertile, and having good machinery to handle the business, potato growing is no more intricate or laborious than corn culture. Although some of our soil is a heavy clay loam, we have grown a good crop of potatoes on our farm each season for several years. Years ago we put in but a small patch each season for family use. But little attention was paid to keeping out all the weeds, and frequently the bugs would get the start of us. In fact, we used to secure three crops from one planting of seed potatoes—more potatoes, weeds and bugs. From several years' actual expericnce we find that the late varieties pay best on our farm, but as we dig late in the season it precludes the possibility of seeding the patch to wheat; and we doubt whether it would pay to sow rye, as the growth during the following Spring would be too small for plowing under for corn. Of course we do not plant potatoes on the same patch two seasons in succession.

When ready to dig last October, we arranged to expedite matters as much as possible. We used four horses abreast on the digger, and another team on the truck to distribute the empty crates to the pickers, and haul the crates of potatoes to the pits. We would not try to do without the bushel crates. We have a good supply added to from time to time, and use them for handling both corn and potatoes. The empty crates are distributed to the pickers from the truck in such a way that each picker finds one almost at his elbow when wanted. Each crate, when full, is left right where it stands; thus the pickers have little lifting to do while picking up. Two men load the truck

HARVESTING AND PITTING POTATOES. Fig. 50.

from each side as the team is driven through, and no full crate is carried more than a few feet before depositing on the truck platform. We put our potatoes in pits, made in the field. Our plan is to sell the crop late in the Fall to customers in our city. However, we pit the potatoes as though they were to be buried all Winter. The picture, Fig. 50, shows one pit filled and ready to cover with straw and earth. A good layer of straw, and about four inches of earth are put on each pit as soon as filled. No chances are taken by leaving the potatoes exposed, even a single night.

In order easily to keep a record of the number of bushels dug, we empty just 50 crates in each pit. We are particular about digging the pits, making a conical pile of the potatoes and properly covering them. Arrangements are made for ventilation in the top, and a flat board prevents water from running in during a storm. The ground about the pits must also allow good surface drainage. Fig. 50 shows just how we manage it. One team and two men, with the low-down platform truck and bushel crates, can store away potatoes as fast as the four-horse digger and 10 men can dig and pick up the potatoes. At such a time we work with a rush, and each man must do his full share so long as the job lasts. We enjoy such work. I drove the four-horse team, and dug the potatoes as fast as the team could walk. A dozen men could not keep up with the digger when everything worked smoothly. We have grown Carman No. 3 and R. N.-Y. No. 2 almost exclusively for several years. For the last three seasons we have sold our potatoes to private customers in Battle Creek, delivering in lots of five bushels or more, right at the customers' doors during a certain week, just before Winter sets in. Customers like to get their potatoes when they are laying in their regular Winter supplies for cold storage in the cellars. We believe in advertising, and, the week before we are ready to deliver we insert a small advertisement in one or two of the leading daily papers. We give variety and quality of the potatoes, guaranteed free from scab, and state the price and time of delivery at customers' doors. No single order is filled for less than five bushels. We could have disposed of twice our last season's crop here in the city at a good price. Orders for nearly 400 bushels were telephoned in the first two days.

Michigan. J. H. BROWN.

R. N.-Y.—The only excuse we have for printing an article on digging potatoes at this time is to show farmers how these pits are made. Now, while many potatoes are rotting or sprouting in warm cellars it is well to know how others manage. The best time to print an ice-house argument is in July.

PROF. I. P. ROBERTS AND THE SILO.

His Private Opinion Publicly Expressed.

Prof. Roberts is quoted as saying that if he did not have a silo he would not build one. I wish to know whether this is true, and if it is, what is the reason for the statements? What he would do without a silo?

Fair Haven, N. Y. F. S. N.

The recent statement by Prof. Roberts at a New York dairy meeting that having no silos one would raise silage corn, cut and wet it as fed, is what I want explained. Why does he recommend it? What facts has he in support of it? Our own practice is two cartlo ads cut corn stover, one cartload silage corn. Wet dry fodder with 15 to 18 gallons of water, then add silage and let stand about six hours or more. We do this on account of having only one silo, and many cows. The above quantity is for one day. I object to the time and cost of wetting.

Burton City, O. A. H.

At the recent meeting of the New York State Dairymen's Association, held at Watertown, I did say that if I were going into the dairy business personally I would not build a silo. The chairman of the association cut off the discussion almost immediately, and I was not allowed to explain this statement. It seems to have created quite an interest. As to the variety of corn to be used that was not correctly reported. Yes, I believe in the silo most thoroughly, but what I had in mind, but did not have an opportunity to express, was something like the following: I would run a dairy so that the products of it would not come into the fierce competition which now prevails in the sale of ordinary dairy goods. I suppose that with but few exceptions the milk of the State of New York does not average one cent per pound to the producer and to start an individual dairy in competition with milk at this price would, in my opinion, not be as wise, or as pleasant or as profitable as to produce dairy goods that, either in the form of milk, cream, butter or cheese, would not come into competition to any great extent with the great mass of dairy products put upon the market. I might say also that I have my particular private likings for a certain kind of cow, but if I should express my private opinion publicly I presume all the bulls of Bashan would be after me. If I were to go into the dairy business I would try to reach out for better quality, greater skill in marketing, and thus aim to escape the fierce competition. To do this I would cater to the wants and even the prejudices of those persons who have plenty of money and are willing to part with it if their special notions can be gratified. I would make the dairy stable as nice as are those of the Walker-Gordon Laboratory Company. I would have cows that give rich milk, or I would separate a part of the milk and fortify the other part so that the milk would contain anywhere from six to 10 per cent of butter fats. Those who are able to pay for fortified or rich milk do not care to buy three-per-cent milk. At least this is my experience. I would have the herd examined frequently, and I would display prominently a bill of health of the herd signed by some well-known veterinarian. I would have physicians visit my dairy. In brief, I would not feed silage because milk might be produced which would not reach the highest standard. I would aim to keep the air in the stable as pure and as free from taints of every kind as possible. I would do all these things because it would be more pleasant and I believe more profitable, to produce the highest possible class of goods, and seek the customers who have the disposition and money to pay a high price for them. If I were so situated that I could not reach this higher market and had to go on in competition with the million, then I would conduct a dairy on quite a different plan. I. P. ROBERTS.

Farmers' Club.

Van Deman's Fruit Notes.

ALL SORTS OF QUESTIONS ANSWERED.

Stayman Apple; German Millet.

H. S., Lynchburg, Va.—1. Would you advise planting 500 Stayman apples instead of Winesap? Winesap does well here, but has so many small apples not fit for market; if the Stayman is larger I think it would take its place. 2. How many times can German millet be cut in one season, sown on good bottom land, if sown about June?

ANS.—1. Yes, I would not fear to plant Stayman instead of Winesap anywhere that the latter is a good variety, because there seems to have been sufficient experience with the two, side by side, in various places, to prove that the Stayman has all the good points of Winesap, and is larger in size of fruit, although some think the color is not quite so deep a red, and the tree is much better in style of growth. 2. Millet will make only one crop from the same seeding. It is strictly an annual plant.

Grafting English Walnuts.

H. B. S., Ohio.—Which of the native nut trees that are hardy in Ohio would make a suitable stock for grafting the English walnut? Is there a way of keeping nuts more than one year, so that they will taste fresh? Has the cold-storage plan been tried?

ANS.—None of them, unless it might be Black walnut or butternut. The Persian (English) walnut is quite tender in Ohio, and should a graft be made to grow it would probably soon die. The planting of nuts of some of the more hardy varieties of this species might prove somewhat successful. A few bearing trees are to be found in the Eastern States where these nuts might be obtained in the proper season. Yes, the cold-storage plan has been tried and found to work very well. The only objection is the cost of holding them so long. The eggs of the Chestnut weevil will not develop into worms under such conditions, and nuts of any kind will not become rancid if kept cold.

Fruits for Massachusetts.

C. H. P., Stockbridge, Mass.—I would like a select list of the best varieties of fruits for this section, for home use, to cover the season. Apples, six Summer, six Fall, 12 Winter; cherries, three sour, three sweet; plums, eight varieties; pears, six Summer and Fall, three Winter; grapes, two black, two white, two red; currants, two red, early and late, one white, one black; gooseberries, three varieties; peaches, two or three varieties; raspberries, three red, succession, three black, succession; blackberries, three succession; strawberries, three to six.

ANS.—The following will probably be a good list of apples for family use in Massachusetts: Summer, Early Harvest, Williams, Primate, Benoni, Fanny, Golden Sweet; Fall, Jefferis, Lowell, Fall Wine, Ramsdell, Ortley and Fall Pippin; Winter, Grimes, Jonathan, Sutton, Swaar, Esopus, Huntsman, R. I. Greening, Roxbury, Hubbardston, Tolman, Romanstem and Newtown Spitzenberg. Cherries: Sour, Richmond, Montmorency and English Morello; sweet, Choisey, Tartarian and Windsor. Peaches: Early Rivers, Elberta and Reeves. Plums: Clyman, Bradshaw, Imperial Gage, Golden Drop, Abundance, Burbank, Wickson and Hale. Pears: Tyson, Madeleine, Howell, Belle Lucrative, Bartlett, Sheldon, Lawrence, Easter and Nelis. Grapes: Black, Campbell, Concord; white, Winchell, Niagara; red, Delaware, Brighton. Currants: Fay, Wilder, White Imperial, Black Naples. Gooseberries: Houghton, Downing, Raspberries: Red, Miller, Loudon and Columbian; black, Conrath, Kansas and Cumberland. Blackberries: Early Harvest, Eldorado and Minnewaska. Strawberries: Tennessee, Carrie, Warfield, Clyde, Glen Mary and Gandy. The above lists are not declared to be perfect in every respect, but the varieties named are among the very good ones for both quality and reliable bearing, although not the heaviest bearers in all cases.

Lime Spray for Peach Trees.

F. B., Covington, Ind.—Will you give the formula for lime spray for retarding the bloom on peach trees; also, when to apply it for best results?

ANS.—Five to 10 pounds of good fresh lime to a barrel of water will make a mixture of sufficient strength to whiten the branches. About March is the time to do the spraying, as the whitewash is likely to be washed off by rains, and the later it can be done to prevent the starting of the buds the better.

Peach Questions.

G. Y. H., Romulus, N. Y.—Will peaches grow on persimmon stock with good success? Are the quality and color of the Arctic peach good? Do you know anything about the Markham peach?

ANS.—No, there is not the slightest possibility of peach buds or grafts growing on persimmon stocks. The Arctic peach is a variety I never saw, and do not know of the existence of it. Nor do I know anything of a variety called Markham. It would be well to look very carefully into any statements that may be made by anyone who may be offering to sell varieties of the peach under these names.

Trellised Fruit Trees.

A. L. J., Idaho.—Can you tell me whether, in Idaho, apples and pears can be grown on each side of a path, to form a hedge, trellised to grow horizontally? High winds and late frosts make fruit growing very difficult on the plains. Is it likely to be more successful if the branches are trained horizontally?

ANS.—I do not know where the writer lives in Idaho, but as I have been about all over that State within the last month and in many orchards of the apple, pear, peach, plum, etc., I have failed to see where they could not be grown with as much success in the ordinary way as elsewhere in the United States. On the plains of the great Snake River Valley there are many orchards near the middle of it, and I have not seen one that was not successful, except that I have been told that late frosts sometimes injure the blooms. The winds are sometimes strong in the Summer, but not to a destructive extent. An arbor of trees as suggested would be of little value, I believe, and usually needless. But one might be made by careful training if it was desired, by simply tying the young branches to a trellis.

Budded or Grafted Apple Trees.

G. H. A., Dover, Del.—Will you give us the truth about grafted and budded apple trees? The itinerant tree peddler is making his rounds, seeking whom he may devour. In trying to hook the writer he made the statement that he would rather pay $1 per tree for budded trees than take grafted trees as a gift. We contended that there was no material difference, and if both were well grown would as soon plant one as the other. Who is right, and why?

ANS.—So far as I have ever tried, or seen others try both budded and grafted apple trees I know of no material difference in favor of either. There are too many millions of root-grafted trees in successful bearing to warrant the statement that they are not good. The argument has been advanced that in the central and western States there are very many of the young trees which have been propagated by grafting that are now failing while yet quite young. This is true, and it is from climatic causes. They bear earlier and much more heavily than in the East. Budded trees are doing the same, and show equal signs of early death or failure. I am at this time in western Washington, and have just been in Idaho and Oregon, where these conditions prevail, and know from observation on the ground, and I have often seen the same elsewhere.

FOR SALE—200 lbs. of Giant Argenteuil Asparagus Seed. This variety of asparagus is the earliest, largest and most prolific asparagus grown on the American continent. Price, $1 per lb. Address WM. C. GERATY, Youngs Island, S. C.

ASPARAGUS ROOTS—1 and 2 year. Millions of them. Five best kinds. Vineland Bush Sweet Potato. A true Jersey Yellow Sweet Potato without vine. All other Vegetable Plants in season. I. & J. L. LEONARD, Iona, N. J.

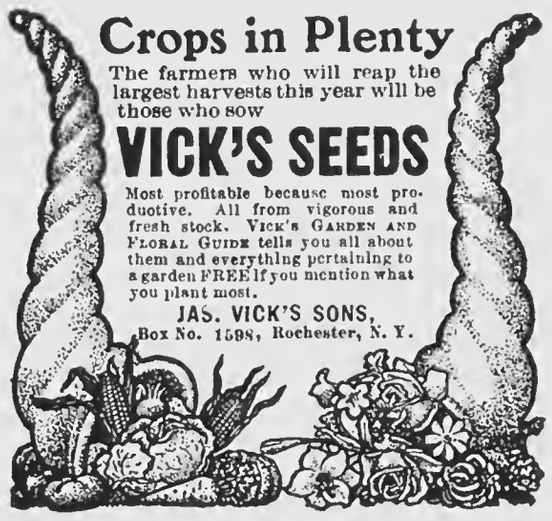
The farmers who will reap the largest harvests this year will be those who sow
VICK'S SEEDS
Most profitable because most productive. All from vigorous and fresh stock. VICK'S GARDEN AND FLORAL GUIDE tells you all about them and everything pertaining to a garden FREE if you mention what you plant most.
JAS. VICK'S SONS,
Box No. 1598, Rochester, N. Y.



EVERYTHING IN SEEDS
Our carefully tested seeds are of unexcelled quality and purity. Most complete seed establishment in the West. Headquarters for Alfalfa, Kaffir Corn, Cane Seed, Millet, and all other Field and Grass Seeds. Introducers and growers of the Kansas Standard Tomato, the Earliest and Best variety known. Our new Free Catalog for 1901 is ready. Write for one.
Kansas Seed House F. BARTELDES & CO. Lawrence, Kas.

FREE
DREER'S Garden Calendar for 1901
The largest and most complete SEED, PLANT and BULB Catalogue ever offered for FREE DISTRIBUTION. It contains 200 pages, which are fully illustrated, true to nature, and is bound in beautiful embossed lithographed covers. We will send a copy free to all who mention this paper, and request those who are Market Gardeners to state the same.
HENRY A. DREER, 714 Chestnut Street, Philadelphia.

BURPEE'S SEED-SENSE FOR 1901
is mailed FREE to all.
A Bright Business Catalogue of ninety pages that tells plain truth about BEST SEEDS that Grow. Write a postal card to-day, or send ten cents (stamps or silver) for BURPEE'S QUARTER-CENTURY FARM ANNUAL,—a New Book of 220 pages fully worth a dollar. W. ATLEE BURPEE & CO., PHILADELPHIA, PA.

NEW OATS FOR 1901 **THE GOLDEN FLEECE**
Originated in Genesee Co., New York. Yielded the past season *108 BUSHELS PER ACRE*, while the yield of others was but 35 to 50 bushels. Spikes or breast contain 3 full kernels, while other oats give but 2. Strong, vigorous straw; does not lodge; *42 to 44 LBS. TO BUSHEL.* Owing to its remarkable stooling qualities *1½ bushels will seed an acre. DESCRIPTIVE CATALOGUE ON APPLICATION.* Prices, by mail, postage paid, lb., 35c.; 3 lbs., $1.00. By freight or express, peck, 70c.; legal bushel (32 lbs.,) $2.00. Sack of 3 legal bushels for $5.00 Address,
JOHNSON & STOKES, SEEDSMEN, PHILADELPHIA, PA.

Crops in Plum and Cherry Orchard

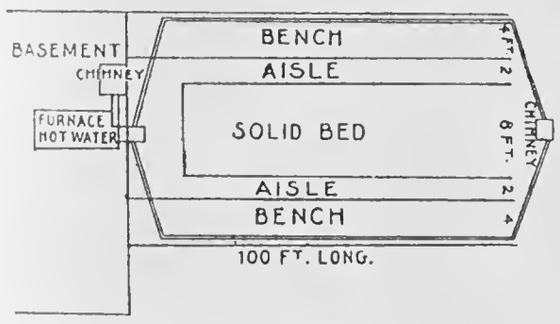
J. W. H., Payne's Depot, Ky.—I have a young plum and cherry orchard set in 1898, where I have cultivated strawberries between trees for two years. The trees have not borne any fruit yet, and are now in a sod of berry vines and grass. What is the best cultivation for a crop of plums and cherries, the crop between rows of trees being a secondary consideration? I have intended, unless advised otherwise, to plow the vines and grass under this Spring and cultivate in corn or potatoes. The trees were not cultivated last year after berry harvest (June), but made enough growth without it, and being in strong soil would make good growth this year, but whether they will make a crop next year without any cultivation I don't know. How shall I manage it for best results in fruit?

ANS.—The plan that I would follow would be to plow shallow early next Spring, and thoroughly cultivate the land all Summer. If the ground is rich enough to produce a good crop of potatoes without injuring the trees it might be as well to plant it as not to do so, but the cropping of orchards of any kind when the trees have attained bearing age is questionable. It would be little loss to omit the potatoes, and might be a decided advantage to the prospective crop of plums and cherries.

Greenhouse Heating.

M. T. W., Sandy Hill, N. Y.—I have a greenhouse 20x100 feet, even span, now heated by hot water; this is not satisfactory, and I want more heat. Will vitrified tile, laid as indicated by double line in Fig. 52, prove satisfactory? I wish to retain the present hot water system and save the heat that escapes now through chimney by carrying smoke through tile under the benches to the opposite end of greenhouse. Is it practicable? How high and of what diameter should the smokestack be? Would tile on one side only of larger caliber (eight-inch) be better than two lines of six-inch as shown in Fig. 52? Practical information is much desired. Should they be laid on the ground or board, or supported above ground, to allow circulation of air around them?

ANS.—It is quite practicable to conduct the smoke and heated gases of combustion through tile to the farther end of greenhouse and thus secure more heating surface. One eight or even 10-inch tile laid on cold side of house would be much more effective than two six-inch tiles, which would soon choke up and cause irregular draft. The stack



TILE FLUES IN GREENHOUSE. FIG. 52.

should be at least 12 feet high to insure a good draft in a 100-foot house, and should have an inside area somewhat greater than the tile. The tile is best laid on an inclined plank supported by brick or stone piers. There should be a rise of at least three feet to the 100, from furnace to junction at chimney.

Cover Crops in Cold Countries.

F. H. A., Oakland, Me.—I have seen in your paper and others a good deal said about cover crops. Away up north here in Maine the ground is usually covered with snow from six to eight months of the year; will your so-called cover crops be of any benefit to us? If so, how are we going to get them? We usually get our harvesting done by the middle of October, and the ground freezes up by the middle of November.

ANS.—If we could be *sure* of snow for the length of time mentioned, there would be less reason for a cover crop than exists in fact. Not infrequently, however, the Winter snow cover is delayed until after January 1, when the ground may be frozen to a depth of two feet. The period of alternate freezing and thawing previous to the snowfall, and again in April, should also be provided for. Our own practice at the Experiment Station is to sow Winter rye, from about August 15 to September 1, and thus secure a heavy mat of leaves before the ground freezes. This again starts vigorously in the Spring, aids in drying out the soil, and when turned under about the middle of May, materially improves the soil texture. The best orchardists in Maine are coming more and more to recognize the benefits of spraying, tillage and cover crops.

Maine Exp. Station. W. M. MUNSON.

Black Beetles on Strawberry Plant.

Reader (No Address).—A small black flea beetle comes on my strawberry plants during the latter part of July. It punctures holes through the leaves, entirely destroying the plants, or weakening them so much that they make only a feeble growth. Is this what is called the Strawberry crown-borer? If so, what is the best remedy?

ANS.—Probably the beetles were not the adults of the grub known as the Strawberry crown-borer, for these beetles usually emerge and feed in August and later; they are unable to fly. But the beetles of one of the Strawberry root-worms are black and work on the foliage in July, often doing much damage; as their grubs feed on the fibrous roots of the plant, the combined work of the beetles and grubs would often result in killing the plants. This Strawberry root-worm is a difficult insect to control, on account of the underground habits of the grubs. Badly-infested fields should be plowed up soon after the crop is gathered. Old unused strawberry beds should not be left as breeding grounds for the pest. New beds should not be set with plants grown in infested beds. If the beetles are killed in July or August it will prevent their laying eggs for a crop of grubs to work the next season. It is said that thorough work with a Paris-green or other poisonous spray, beginning as soon as the fruit is picked, and making applications every week or 10 days as long as any beetles are to be seen, will greatly reduce the crop of beetles, and thus do much to control the pest for the next season.

M. V. SLINGERLAND.

Treatment for Potato Scab; Crimson Clover.

H. N. T., Providence, R. I.—What is the formalin, and what the sulphur treatment for potatoes? How much Crimson clover seed to the acre?

ANS.—Formalin is a liquid. Mix at the rate of half a pint in 15 gallons of water. Rinse the dirt off the potatoes, and then soak them in this mixture for an hour and a half. Then dry and cut. The object of this is to destroy the germs of the scab—which is a disease. The "sulphur treatment" consists in dusting dry flowers of sulphur over the pieces as the seed potatoes are cut. We cut into peach baskets, and scatter a handful of the sulphur over the cut pieces, shaking it well down. The sulphur not only kills many of the scab germs, but seems to preserve the seed, especially in cold, damp seasons when there is danger of rotting. We use 15 pounds of Crimson clover seed per acre.

CHEMICALS FOR FRUIT.—We are often asked whether there is any better mixture of chemicals than ground bone and potash for fruit trees. Where the soil is cultivated thoroughly three parts fine bone and one part muriate or sulphate of potash will answer. This is the simplest mixture, but not always cheapest and best. With old trees, especially where they stand in sod, one part nitrate of soda, one part bone, two parts dissolved rock and one part of muriate or sulphate will give better results. The nitrate is at once soluble, and will soak down below the grass. So will the potash and the phosphoric acid in the rock.

PEAR BLIGHT.—The reference in THE R. N.-Y. on page 73 to Pear blight as discussed at the Rochester meeting of Western N. Y. Horticultural Society should have been as follows: Prof. Johnson stated that the various diseases of the pear and other fruit trees were being studied in Maryland by Prof. C. O. Townsend, State Pathologist, and that an experiment had been made on his place with cotton and a two-per-cent solution of formalin upon a certain blighted pear tree, with, apparently, good results. While the experiments were not complete, he thought the results were promising, and that more conclusive information would soon follow Prof. Townsend's work.

For the land's sake, use Bowker's Fertilizers. They enrich the earth.—*Adv.*

A New Vegetable

Austra-lian **"CRIMSON WINTER"** Rhu-barb.

The GREAT VALUE OF RHUBARB has always been its earliness. **CRIMSON WINTER** is fully six months earlier than any other Rhubarb.

EVERY FRUIT GROWER SHOULD READ R. M. KELLOGG'S NEW BOOK, ENTITLED

GREAT CROPS OF SMALL FRUIT

AND HOW TO GROW THEM. The author has grown the largest crops of fancy fruit ever produced on an acre. In his experimental grounds are **single plants which yield over FOUR QUARTS** each of fine large berries. His customers have done as well. This has been accomplished by SCIENTIFICALLY BREEDING up plants to a high fruiting vigor so they throw their energies to the development of fruit instead of useless runners. **The profit comes from a big crop of big berries** that sells at sight to regular customers. This book tells you all about how it is done. THE CHEAPEST PLANT is the one that will give you the best fruit and most of it. You can't afford to play **second fiddle** on the market by using scrub plants. The only stock of scientifically-grown thoroughbred plants in the country for Spring planting. Send your address at once, and get a copy of this book, and a revised edition for three years FREE. Address

R. M. KELLOGG, Three Rivers, Mich.

SOLUBLE FERTILIZER SCIENCE.

How to Estimate Values.

Reader, Tioga Co., Pa.—A good many people are scanning the fertilizer catalogues with a considerable degree of interest, and those of us who used freely of them during the late drought, to no perceptible benefit, are alive to the word *interest*. Possibly, and very probably, we were not as intelligent buyers as it is possible for THE R. N.-Y. to make us. Hence, some questions. Years ago the formula was something like this: Nitrogen, two to three per cent; phosphoric acid, four to five per cent; potash, four to five per cent. At present the word "ammonia" has replaced the word nitrogen. When nitrogen is worth say, 15 cents per pound, what valuation shall we put on ammonia? Then we have the words "reverted" and "insoluble" as additions. When phosphoric acid is worth five cents per pound, what valuation shall we place on insoluble and reverted? The same answer is requested for potash. I have in my possession two formulas, one priced at $36 per ton and the other at $47.50; $11.50 per ton difference in selling price, and yet I could not find but about $6 difference in constituents. Can you give a good reason for this? A very much exploited $40 fertilizer of another company contained only $22.50 of value—said to be "as good or better than Mapes." I took the Mapes, and still am asking questions, as what I know would not fill a very large pamphlet.

ANS.—In its natural state nitrogen is a gas. It does not combine well with most other substances. Thus it makes the powerful or "kicking" part of most explosives, as it gets away from a combination as quickly as possible. In fertilizers it must be combined with other substances in order to be useful, and "ammonia" is a combination of nitrogen with another gas called hydrogen. The hydrogen hangs on to the nitrogen and holds it in place and form. It takes three parts of hydrogen to hold one part of nitrogen, and this proportion is always found in ammonia. Nitrogen weighs 14 times as much as hydrogen. Therefore, in one pound of ammonia there will be fourteen-seventeenths, 82.35 per cent, or 13.17 ounces of nitrogen. You should never buy fertilizer on the basis of its ammonia, but figure out the actual nitrogen. When nitrogen is worth 15 cents a pound, or .938 cent an ounce, a pound of ammonia containing 13.17 ounces of nitrogen is worth 12.35 cents, or fourteen-seventeenths of 15. There are three forms of phosphoric acid. The insoluble form is combined with lime in the proportion of three parts of lime to one of phosphoric acid. When sulphuric acid is added to the finely-ground insoluble phosphate it is "broken up"—that is, two parts of the lime are taken away by the acid, leaving only one part of lime to each part of phosphoric acid. In this form the phosphoric acid is soluble in water. When this soluble acid is put in the ground or near lime, it takes up another part of lime, making two for each part of phosphoric acid. This is called the "reverted" form. It is not soluble in water, but will dissolve in weak vinegar, which represents about the strength of the acids secreted by the roots of growing plants. In estimating the value of a fertilizer "soluble" and "reverted" are considered equal in value, and are called "available." In Pennsylvania, the chemists consider the "insoluble" phosphate worth two cents a pound. The rule in New England, New Jersey and New York is to figure only on the available phosphoric acid, and not consider the insoluble part.

The various forms of potash are all soluble in water. They differ in value somewhat, the basis of this difference being the fact that they do or do not contain a substance known as chlorine. This chlorine is a part of common salt, and when there is a certain amount of it present the chemist concludes that the potash comes in the form of muriate or kainit, both of which contain more or less salt and are not considered so good for crops like potatoes, beets or strawberries. The potash in these forms is considered worth half a cent less per pound than that in the sulphate or in wood ashes. Of course we must understand that it is not a mere statement of analysis that gives true value to a fertilizer. The different kinds or forms of nitrogen differ greatly in value. One man might use a large quantity of tankage or ground fish, and get a high per cent of nitrogen, but his fertilizer would not be worth nearly as much as another with the same per cent of nitrogen obtained by a mixture of nitrate of soda, bone, tankage, cotton-seed meal and sulphate of ammonia. In the case mentioned, of course we cannot say definitely without knowing how much of the nitrogen was from nitrates. Chemists are now giving these analyses, so that this point is made quite clear.

What Field for Alfalfa.

B., Cobleskill, N. Y.—We have two pieces of land plowed, each containing about five acres, and upon one we would like to sow Alfalfa; one piece is rather low and half surrounded by a brook, though not wet, and is of a mixed soil—a spot of black loam, a sandy streak, another of yellow clay, and so on. The other field is an ordinary dark soil, not very heavy nor yet light; upland, and facing the north. Which would be the better place for Alfalfa?

ANS.—If the hill field is in good condition we should prefer it for Alfalfa. This plant does not like "wet feet," and the field lying near the brook would be likely to prove too wet from overflow, or because the water is near the surface.

Planting Locusts for Posts.

R. S., Long Island.—Next Spring I wish to plant an acre of locust for posts. Will you advise me which is better to plant, the Yellow or Black locust? I have some White locust which the borers trouble badly. Would Yellow or Black locust be exempt from borers?

ANS.—The Black, Yellow and White locusts are merely varieties or forms of the same species, Robinia pseudacacia. The black and yellow forms are considered most resistant and are usually found in the driest places. If seeds or suckers can be had from these dark and dense-wooded types they would naturally be preferred for planting. All varieties of the common locust are attacked by borers, and a multitude of insect enemies. The Honey locust, Gleditschia triacanthos, is not troubled by insects to so great an extent as the Robinia, but is much inferior in lasting qualities as fence material.

Some Varieties of Gooseberries.

N. T., Carrollton, Ill.—What do you think about the following gooseberries, Keepsake, Industry, Red Jacket and Pearl? My soil is a deep rich loam with a clay subsoil. I have now Downing and Houghton, but I would like to have something larger. What do you think of Red Cross currant? Is it better than Cherry?

ANS.—Keepsake is one of the most promising European varieties for extensive trials in this country. It has only been offered here within the last few years, but has given evidence of suitability to our climate. The bush is vigorous and prolific, and the berries very large, and of tolerable quality. We have not heard of any commercial trials of the Keepsake. Industry bears fine red fruits of good quality, but as a rule is a feeble grower, except in a few favorable localities. Most of the bushes planted within the past 10 years are either dead or but little larger than when set out. Red Jacket or Josselyn is vigorous and prolific, fruit of fair size and quality, but the habit is too sprawling for an ideal gooseberry. Pearl is generally vigorous and wonderfully prolific. The berries are larger than Downing, and of good cooking quality. We would rather plant it for profit than any of the other varieties mentioned. We have seen no evidence to prove that Red Cross is a better market currant than Cherry. It is lighter in color, milder in flavor, and somewhat later in ripening, but otherwise the difference is not marked.

WHEN you write advertisers mention THE R. N.-Y. and you will get a quick reply and "a square deal." See our guarantee 8th page.

FUMIGATION WILL NOT COME BETWEEN YOU AND US, but we stand between you and danger when you buy **ROGERS TREES,** for we fumigate every tree you buy of us. It costs only 15c. to 50c. per 1,000 trees. You may run no risk without it, but it's surer when it's done. We belong to no nursery combine, we make our own prices, we grow our own trees and you will find it safe in every way to place your order to-day with THE ROGERS NURSERIES, **The Tree Breeders,** Dansville, N. Y.

HOPE FARM NOTES.

WIND POWER.—After 18 months of work, I am very well satisfied with our windmill and pump. Our wind records are not complete, but I do not think there have been a dozen days in all that time without wind enough for at least a few hours of pumping. Our tank has never been empty except when we cleaned it out, and there has been a constant supply of cold water at the barn and hot and cold water at the house. A reader wishes to know why we did not put up a power mill while we were about it, and thus do our own grinding, sawing, and other work. I thought of it at the time, but finally gave it up. I had the well drilled at a point away from the buildings where, if need be, it will be convenient for irrigating a large field. I hope some day to be able to own a power that can be moved about from place to place to do work on any part of the farm. For example, I would like to take the table saw right over to the woods and cut the stove wood there, or even shred the fodder right in the field. I would rather take the power to the work than to bring the work up to the power, and some day I hope to be able to do it. For such work as pumping, the small windmill is O. K. in our country.

WOMEN AND HORSES.—When I handed the following letter over to the Madame she said after reading it: "She is all right!" The Madame's opinion goes—*inside* the house at least—and so the letter goes also:

"I, too, wish to say a word to Hope Farm man. I think your estimate of the horse 'that officiates as a woman's horse' altogether too small; the interest on $15! Just think of it—90 cents! Now, if I were to estimate in dollars and cents the pleasure derived in one year from petting, harnessing and driving our horses, I know it would be greater than any of the items you mention; and I can hustle over an acre of dishes after dinner pretty lively if in antielpation of a horse to drive in the afternoon, and many times have left the dishwater to get cold and went to the door to say 'Hello' to the horscs as they came from the barn. You will say, Do you get repaid for all those mlles of travel? Certainly, when they put their noses in my face and say in their horse language by looks and actions, 'I like you!' Now, just give your women folks a chance to drive your horse that $250 wouldn't buy, and I'll bet a pie that they would do those dishes quicker or give you a chance to wash them while they go pleasure driving. But before they start be sure they know the difference between the breast collar and breeching In case of accident. All honor to the old horse. Feed him on molasses as long as he lives, and thc tears of the whole family on his grave when he dies, but a woman likes to drive a good horse as well as you. My husband never refuses pie, but doesn't kick if on a fine morning when the horscs are at leisure I go driving instead of mixing lard and flour for his dinner. There would be less chronic grunters among our women if they spent some of their leisure time in this way instead of on the sofa reading trashy novels. I do not yearn for a bicycle or automobile; a horse worth $150 hitched to a good buggy ls good enough for me, and when Hope Farm man estimates woman's pleasure in this line at such a small sum he runs against a snag."

FARMER'S WIFE FROM 'WAY BACK.

Now, I meant no disrespect to old Major when I rated him at $15. I was trying to get at the true or selling value of our stock, the value that pays bills. The old fellow wouldn't bring an offer of $5, but the Madame wouldn't let him go where he would be abused for $500. Frank, the horse I value at $250, is a big farm horse—stronger than a yoke of cattle, but not much good on the road. Our women folks often drive him, but he is better in front of a plow or a load of hay. I bought Nellie Bly hoping to have a horse that the Madame could drive, but the mare proved a llttle too frisky and timid at sight of a bicycle. No one should drive a horse until he knows how to harness and unharness. Grandmother and the Graft are the only Hope Farm drivers who have never done it—the Graft understands the *theory* of a harness. I like to have our women folks hitch up and drive, and Major, Franko and Nellie are always at their service, with Frank and Dan part of the time. I think that some women would be better off if they *walked* more, but riding is much better than "reading trashy novels." That is about the worst business a farmer's wife or daughter can be up to, when the world is full of strong uplifting books which would help and inspire them to nobler and higher living. Yes, yes, I ran against a big snag when I estimated the yearly value of a woman's horse at 90 cents. The fun our folks have out of old Major couldn't be bought for the legal interest on $1,500. This, however, does not pay taxes or interest.

PORK AND EGGS.—Both are in sharp demand in our neighborhood. Butchers will pay 8½ cents per pound for dressed pork, and eggs sell eight for a quarter. There are very few pigs for sale in our part of the country. I am more and more satisfied that there is good profit in pork. We do not sell now, because it pays us better to keep our pork for home use, but if I had 50 good pigs now they could all be sold to advantage before May. I do not mean to say that it will pay us to feed pigs in little pens on purchased grain. We never can compete with the West by bringing them grain here to feed, but we can do it by feeding the pigs through the Summer on rape, sorghum and cabbage, with a small amount of grain, and finishing them off on corn grown on what are now waste or loafer fields at the back of the farm. I have studied this thing hard for several years, and I am now satisfied that it is practical. I have started a good purebred herd of hogs, and we are building a hog-house so as to go at it right. As for eggs, in spite of all the talk about overproduction, people complain that fresh eggs are scarce. Hope Farm is not the best place for poultry, yet I think we could run a flock of 500 with some profit.

HOME NOTES.—The Madame had folded her napkin and proceeded to run her eye around the dinner table as a good housekeeper should. Surely it was a row of well fed and contented faces that came in view. The great platter of meat which Aunt Jennie had placed on the table was now but a pile of bones. The potato dish was empty, the Lima beans had vanished, and only a few crumbs remained on the bread plate, while the plum pudding was all out of plumb. Surely the wreck of that dinner was a glorious monument to the cook. "Well, now," said the Madame, "do you suppose that the new King of England enjoyed his dinner half as much as we have ours?"

Outside the snow was whirling and dancing with the fierce wind. It was a bitter day for man or beast to be abroad. It didn't take me long to make up my mind that I would rather occupy the chair at Hope Farm than sit on King Edward's throne. There may be those who envy his royal highness the job he has just fallen heir to. I am very much obliged to you, but I don't want even a corner of it. There is more happiness even in the mortgage on Hope Farm than in the sorrows and crimes that cluster around the Cape of Good Hope. . . . . We have had 10 days of good sleighing, with cold sharp weather. On a very cold windy morning I again carried the thermometer down hill. This time there was no difference. It was just as cold on the hills as in the valley. This is just what one might expect; on still nights the cold air settles in the valley while when the wind blows hard it is all mixed up—if anything, the hills are colder. . . . . The children have made much of the coasting, and the big folks have had a hand at it, too. There is a little hill on the road in front of the house. . . . . Our friend who writes about the "woman's horse" talks about "trashy novels." I would call such books "mental pies" with mighty poor crust. I don't want to hurt the feelings of the pie eaters and pie bakers, who have a perfect right to pile on the pie if they want to. I prefer the pure fruit and also the natural and true books. Those who must work for a living, and I have little use for anyone else, have no time to take from a busy life to read "trash." You may be surprised to hear an old farmer say so, but I believe that one may well read a selection of good poetry every day. I have read Whittier again and again in this way. Will this enable a man to raise more corn or know a good hog when he sees one? Perhaps not—though we call our fine sow a poem in pork—but it will raise the mind and soul—are they not worth more than corn? . . . . I have read the stories of those who claimed that tin cans and glass concentrated the rays of the sun and set things on fire. We have had such a case at Hope Farm. The children have three goldfish which swim about in a small glass globe partly filled with water. This globe stood in a sunny window when Grandmother saw smoke arising near it. Investigation showed that the sun's rays had been concentrated through that globe upon a small tape measure which lay on the window sill, and had actually set it on fire. It was easy to prove this by holding the hand where the light fell. I notice that when the globe is filled with water the heat is not nearly so strong. It is a most wonderful thing to the children that a jar containing *water* should be able to set things on fire. H. W. C.

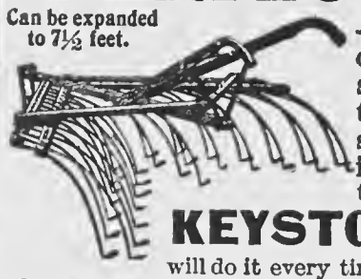
PERFECT CULTIVATION

Can be expanded to 7½ feet.



—the kind that means perfect crops, presumes the use of some implement which will thoroughly break up the top soil crust, thoroughly uprooting every weed, and admitting the light, air, warmth and moisture.

KEYSTONE Adjustable Weeder & Shallow Cultivator will do it every time, for all crops and on all soils.

Can be narrowed to 30 inches.

Can be expanded to cover a sweep of 7½ feet, or narrowed down to 30 inches to be used between the rows. They are not like other weeders—**they are better.** Works where the straight frame weeder is incapacitated. No cumbersome shafts. Runs steady. Strong, springy, pliable teeth. Blunt points for tender, sensitive plants. Flat teeth with diamond points for heavy clay soils, if desired. **Booklet on Weeders mailed free.**

We also make 10 styles **Corn Planters,** 12 styles **Cultivators,** 20 styles **Corn Shellers**—hand and power, **Harrows, Field Rollers, Feed Cutters, etc.** Write for new **Catalogue C.**

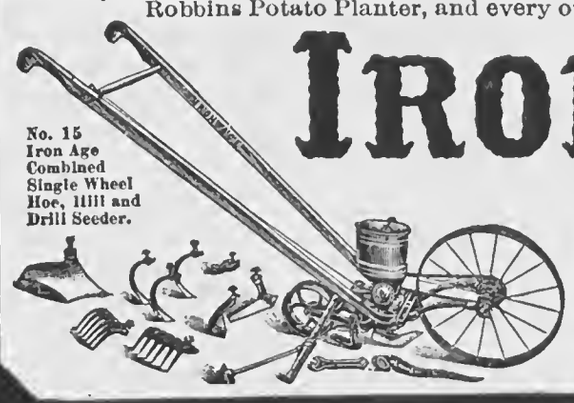
Coax a Crop the Right Way

Iron Age Pivot Wheel Cultivator.

Thousands who have used the **Iron Age** implements will tell you that every one is an investment that never fails to pay. Since our works were established in 1836, every year has shown progress. We have steadily improved our Seed Drills, Wheel Hoes, Riding Cultivators, Horse Hoes, Cultivators, Improved Robbins Potato Planter, and every other one of the

IRON AGE Farm and Garden Implements



No. 15 Iron Age Combined Single Wheel Hoe, Hill and Drill Seeder.

A new implement this year, and a wonder, too, is the new **No. 15 Iron Age Combined Single Wheel Hoe, Hill and Drill Seeder** which combines the best seed drill and single wheel hoe ever produced. Each is complete in itself; they combine with perfect unity and can be changed instantly from one to the other. This excellent tool fills every need in handling seed and soil. It places the seed in hills or drills, plows, rakes, opens furrows, covers, hills, hoes and cultivates. All the **Iron Age** labor savers are fully described in the new **Iron Age Book,** which every successful farmer should keep within reach. **It's free.** WRITE TO-DAY.

BATEMAN MFG. CO., Box 102 Grenloch, N. J.

Ruralisms

NOTES FROM THE RURAL GROUNDS.

Variety Test of Potatoes in 1900.

The following new varieties of potatoes were planted April 8 in a plot of loamy soil, in rather poor condition. The only fertilization was an application of two pounds of Mapes potato manure to each rod of drill, scratched in with a rake before planting. Three applications of dry Fungiroid were made during the growing season to ward off leaf blight; apparently with fair success. The season was locally a bad one, the average yield in the neighborhood not exceeding half an average crop. A fair cultivation was given, and no weeds were allowed to develop. Under such conditions only a light yield could be expected, but it is noticeable that the two standard varieties, Carman No. 2 and Rural Blush, planted for comparison, stood the severe test better than most of the new kinds. The "hills" consisted each of half a potato planted 20 inches apart in rows 40 inches apart.

CARMAN No. 3.—Hope Farm. Dug September 12; eight hills, 46 tubers; weight, nine pounds.

MIDDLE WEST.—Bovee. Dug September 12; three hills, six tubers; weight, one pound. White, smooth; quality good.

RURAL BLUSH.—Hope Farm. Dug September 12; six hills, 34 tubers; weight, 7¾ pounds. One of the best in quality.

EXCELSIOR JUNIOR, LATE.—Woolley. Dug September 12; two hills, 10 tubers, all small; rather dark red. Vines weak. blighted severely.

SURPRISE.—T. C. Heath, Tidal, Pa. Dug September 20; six hills, 24 tubers; weight, 5½ pounds. White, russeted, round and smooth; fine quality.

MUNN'S EARLIEST.—Name of sender lost. Dug August 10; five hills, 31 tubers; weight five pounds. Large, smooth, round, white; early and fine quality.

LATE BEAUTY.—Heath. Dug August 12; four hills, 24 tubers; weight, 4½ pounds. Smooth, white, shallow eyes, somewhat russeted; quality excellent.

IMPROVED NEW QUEEN.—Jerrard Co. Dug September 9; six hills; 38 tubers, 29 marketable; weight, four pounds. White, russeted, oblong; quality excellent.

KING OF MICHIGAN.—Flansburgh & Peirson, Leslie, Mich. Dug September 9; three hills, 20 tubers; weight, three pounds. Sturdy grower; sound, russet; good quality.

STEVENS.—Jerrard Co. Dug September 9; six hills, 59 tubers, 41 marketable; weight, six pounds. Strong grower and productive; ripens medium early; good quality.

THE Boss.—Bovee. Dug September 12; three hills, nine tubers; weight, two pounds; inclined to be prongy; strongly russeted. Vigorous grower, medium early; quality fair.

HEATH'S EXTRA EARLY MARKET.—Heath. Dug July 29; four hills, 22 tubers, 14 marketable; weight two pounds. Smooth and good quality; needs more fertility in soil.

NEW QUEEN.—G. W. P. Jerrard Co., Caribou, Me. Dug September 9; eight hills, 40 tubers, 28 marketable, weight 8¾ pounds. White, russeted; quality good; fine grower.

FOURTH OF JULY.—James Hoyt, New Canaan, Conn. Dug August 10; five hills, 38 tubers, 27 marketable; weight, six pounds. Large, round, white and early; excellent quality.

WHITON'S WHITE.—W. W. Whiton, Wakeman, O. Dug September 12; 10 hills, 66 tubers, 42 marketable; weight, 12 pounds. Round, white, slightly netted; highest quality. Growth vigorous; potatoes grow close together in hill.

EXCELSIOR JUNIOR, EARLY.—James Woolley, Dover, Ill. Dug August 9; four hills, 26 tubers, 16 marketable; weight, three pounds. Long, pinkish color; good quality; vines weak, tendency to scab.

MILLET'S SEEDLING.—J.W. Millet, Bismarck, N. D. Dug September 18; six hills, 42 tubers, 31 marketable; weight, nine pounds. Early, smooth, white; quality very good; vines strong and upright.

BOVEE'S BEST.—Marion Bovee, Northville, Mich. Dug September 12; three hills, 13 tubers, nine marketable; weight, two pounds. Smooth, white; shallow eyes. Vines rather weak; quality very good.

RURAL JUNIOR.—Woolley. Dug September 18; two hills, eight tubers, all small; weight, one pound. Red, smooth, vines blighted; quality very high. The Rural Junior was a sixth-crop seedling; the other two Woolley varieties were fifth-crop seedlings.

THE BABY PRIMROSE.—Under this name a very pretty, small-flowering primrose, Primula Forbesii, was extensively advertised two or three years ago by several mail-order nurseries. It has not met with sales at all commensurate with its value as a window plant. The pretty rosy-lilac flowers are most continuously produced during the Winter and Spring, and if kept in a moderately shaded position a good plant will bloom continuously for nine months or more. The foliage is good, and the graceful sprays of bloom are very useful for cut flowers. The Baby primrose may easily be grown from seeds, which should be planted during Winter in a pot or seed pan. The seedlings soon begin to bloom if potted off in small pots. Old plants produce a multitude of suckers, which may generally be detached with roots enough to keep them growing right along when replanted. Fig. 48, first page, is from a life-size photograph of an average young plant from the Rural Grounds.

AN EXTRAORDINARY HYBRID.—A reader of THE R. N.-Y. sends an account of an extraordinary plant he conceives to be a hybrid between the raspberry and the potato:

Three years ago I discovered the potato vines growing on a berry bush or root. I thought at first it was a potato growing among the wild bushes in the pasture. It is several rods from the potato field; I thought it strange, as potatoes in fields were little young plants, and these had blossomed. Looking closer I saw what it was. It blossomed and produeed potato balls (no berry taste) all Summer till very late Autumn. The next Spring I planted the seed of the plants; this is as unlike the berry as possible. These potato seeds sown about April 1 come up as soon as tomatoes, mostly a day or so sooner. They grow fast, and do not mind frost that will kill tomato plants. In July they were large, flourishing plants, smelling rank, like the real potato and blossoming and bearing potato balls. Late in the Fall I looked for potatoes; the roots are long and white, but no potatoes yet. One would pass these vines growing without a thought but they were potatoes, but on looking closer the stalk grows more viny, the leaves narrower, the blossom more slender, a beautiful purple with orange middle. The balls are red and disagreeable in taste, just like the real potato. I have saved and planted seed for two years with the same result. This potato is too wild; wants mixing again, I think, with the real potato. It might give a potato hardy as a cabbage or as a parsnip. I do not understand hybridizing, but if this is anything remarkable I am going to have some one who understands the art try to see what ean be done. S. C.

This description admirably fits the Horse nettle, Solanum Carolinense, one of the worst native weeds in the South and West. It sends up its prickly stems with the greatest persistence from the thick, hardy, root-stocks, and is quite as difficult to eradicate as the Canada thistle. The bright, orange red, tomato-like berries persist during the greater part of the Winter. We have advised our correspondent to destroy every trace of this obstinate pest before it gets a dangerous foothold on his farm. The idea of producing a hardy potato by crossing with a hardy berry does not seem so far out of the way when one considers the condition under which this plant was found, and manner in which it combines some of the characteristics of both plants. The Horse nettle is a close relative of the potato, both belonging to the same family, but the raspberry is a member of the Rose family, and has no affinity with the Solanums, though the prickers on this particular species give a slight resemblance.

WHEN you write advertisers mention THE R. N.-Y. and you will get a quick reply and "a square deal." See our guarantee 8th page.

THE SAMSON Wind Mill

has made the most phenomenal record ever known to a machine of this kind. It bears the unqualified endorsement of every man who has seen or used it. This is due to its many superior qualities. The

Live Stock and Dairy

THE ORDINARY BOVINE GENTLEMAN

As He Is.—With a large majority of farmers "purebred" is an animal seen under a blanket at the fair, or read about in an agricultural paper. As one travels through the country he finds poor stock, poor care and poor surroundings, while not one farmer in 50 has a purebred herd or flock of any kind, and some men will not yet give up the old idea of using the cattle to warm the air in the barnyard. We are sometimes told that it is just as easy to have a herd of purebred cattle, or flock of hens, or sheep, or drove of hogs, and thereby double our income; be that as it may, purebred stock will always be the exception and not the rule, and what right has a farmer with purebreds if he does not half take care of the so-called scrubs now on hand? Breeders of purebred cattle claim to consider the bull "half the herd;" the ordinary farmer looks on him as a "means to an end;" that of having fresh milkers at some season of the year. Bull calves are raised without much thought of past, present or future. They are poorly fed and cared for, and at the age of one year are pronounced "good ones" by the owner, even though not large enough for service until 18 months or two years old. A little pen picture of an actual experience will quite forcibly illustrate the question in hand. Father and I started one day in the latter part of March to purchase a good yearling bull for service the coming Summer. We made many inquiries, and looked upon animals of varying size, shades and condition; we were finally told of a young farmer (not an old man, mind you) about five miles north, who had a good yearling bull that he was very anxious to sell. So away we drove, eager to obtain the coveted "good one." We found the young man at home, made known our errand, and were told that what he called a good yearling was for sale. The barn had burned the previous Summer, so we went to a large shed some distance from the house, where the cattle and young stock were kept for the Winter. As the door was pushed open I shall never forget the sight that met our eyes. First inside the door stood the so-called bull, but the name was a misfit. I was never more taken down in my life than at the sight of that little weazen-faced, long-haired, scrubby, manure-covered runt. He was not too large for a stout man to carry. His rear end was elevated on a mound of manure, while his front feet were at low-water mark. There was no floor in the shed, and 12 or 14 cattle and young stock were fastened in stanchions, standing in the soft filth and mud, with their sides plastered, for no straw was in evidence anywhere and the stable (?) had not been cleaned in weeks. That sight is indelibly inscribed on memory's page. We climbed into our sleigh too full for utterance, for the young man said he would take $15 for the bull. We have often spoken of our adventure hunting bulls in the wilds of Oswego County. This is an extreme picture, but it can be duplicated in miniature without much canvassing. I was in a young farmer's basement stable but a few days ago, where it was too dark even to see the cows with the door closed, and the manure had not been thrown out in at least three days; the cattle were eating wheat straw, yearlings no larger than the October calves in our basement, while their general appearance was that of stunted little dwarfs.

As He Might Be.—The average farmer with a small herd cannot expect to handle his stock as the breeder of purebred cattle might do; yet it will pay him to give them good serviceable care. The method that I shall outline applies to heifer as well as bull calves until six months old. If you do not pay any attention to the rules governing selection as laid down by the fancy breeder of pedigree, you can at least choose a good straight bull calf from one of your very best cows. And now let me introduce a little note in regard to teaching him to drink. Do not let him suck the cow. Following a law of nature, the little calf reaches upward with his head and nose, and if he obtains his first drink of milk in that way, you have a double task marked out to get his head down into a pail. I am not theorizing, but speak from actual tests. I take a calf away from the cow almost immediately, when possible; leave him until he is hungry, and can stand up all right; place him in a corner where he can't back up, and despite the holy horror of "such brutal treatment" as some have written, I straddle his back, with an attendant if possible to hold the pail of freshly drawn milk, with one hand on the calf's head and the fingers of the other hand at the end of his nose, gently force his nose into the milk, letting him have his head when he struggles. Some smart calves will take the milk at once, while with others it is necessary to put a finger into their mouth and let them suck once or twice to get started. I have never failed to make a calf drink almost immediately. Do not overfeed him; better leave him a little hungry.

When one week old take time to put caustic potash on his horns. It will only bother you a few minutes, and will be a satisfaction while he stays with you. Tie him short, hold his head firm, shear the hair from the embryo horn, and moisten by wetting the finger. Wrap a stick of caustic in paper when it comes in contact with the fingers, rub it on the little horn bulb until it becomes red, and the job is done. How simple, and yet so many neglect it! When your calf is about three weeks old begin to put a little dry bran and meal, mixed half and half by weight, into his mouth by hand immediately after he drinks, and it takes but a few days for him to learn to eat it from the measure held in your hand, and from that to a box tacked up on the side of his pen. Don't give him too much. Feed him regularly, raise him through the Winter if you can. If you raise him in Summer, and wish to make a nice one keep him in the barn all Summer, loose in a pen; feed him regularly and well. Give him skim-milk if you have it. We have had bull calves raised in this way that at eight months old were called splendid yearlings by all who saw them. But all this is lots of fussing. Yes, yes, and that is where the profit is made on stock, my friend. Such a bull will be ready for service from the beginning of his second year, and nine times out of 10 will be better than a two or three-year-old. We have always let the bull run with the herd; have never kept him confined in stanchions, but tied with rope when in the barn. A two-year-old bull running with the herd, usually has altogether too much spirit for the good of the fences or the safety of the attendants, and especially so if fed grain. Not so with the yearling. Don't forget his little mess of meal, and he will come into the barn with the cows, and to his place, like a hungry boy to his seat at the dinner table. When the "bully boy" is 18 months old, sell or kill him and raise another. H. S. Wright.

Onondaga Co., N. Y.

R. N.-Y.—But why be satisfied with "average?" We are satisfied that it pays to pay more money for a bull calf of good breeding, raise him about as Mr. Wright describes, and keep him at least three years. Good dairy bull calves, a little off in color, but with good pedigrees, may now be bought at fair figures. Are they not worth more than those who are simply "out of a good cow?"

Shredded Silage.—R. M. Welles, of Pennsylvania, agent for the Blizzard cutters or shredders, sends us a sample of silage which is fine and sweet. This silage came from Wayne Co., N. Y., where W. M. Lawrence used a Blizzard in filling silos for neighbors. Just now there is some question about silage which is shredded or torn rather than cut. Mr. Lawrence writes:

Some are complaining here because the silage is cold, and does not heat up and keep warm like that cut with other machines; but I know my cows eat it better, and there is no corn passing through them unmasticated (undigested) as there was before. What do you think is the reason for our silage being so cold? Is it because it is finer and more compact?

To this Mr. Welles replies:

Yes, that is the reason. I know that Blizzard silage was often finer, and settled quicker and packed better than prepared by other machines, so that more could be put into any given space in a day. This very close packing seals up the cut material from the air like canned fruit, does not pass through the vinous or souring fermentation and keeps sweeter and better.

When you write advertisers mention The R. N.-Y. and you will get a quick reply and "a square deal." See our guarantee 8th page.

"Stick to the bridge that carries you safe over." For more than sixty-two years Dr. D. Jayne's Expectorant has done that for thousands of sufferers from Lung and Throat troubles.—*Adv.*

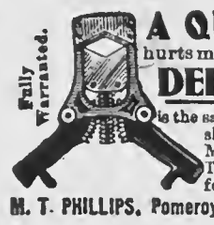
THE CHAIN-HANGING Cattle Stanchion

The most practical and humane Fastener ever invented. Gives perfect freedom of the head. Illustrated Circular and Price free on application. Manufactured by O. H. ROBERTSON, Forestville, Conn.

NO SPAVINS

The worst possible spavin can be cured in 45 minutes. Curbs, splints and ringbones just as quick. Not painful and never has failed. Detailed information about this new method sent free to horse owners. Write today. Ask for pamphlet No. 34. FLEMING BROS., Union Stock Yards, Chicago, Ill.



Fully Warranted.

A QUICK, SHARP CUT hurts much less than a bruise, crush or tear DEHORNING Done with the KEYSTONE KNIFE is the safest. Quick, sharp cut. Cuts from four sides at once. Cannot crush bruise or tear. Most humane method of dehorning known. Took highest award World's Fair. Write for free circulars before buying. M. T. PHILLIPS, Pomeroy, Pa., (Successor to A. C. BROSIUS).

Be Kind to Stock by humanely dishorning them only with the quick, smooth cutting Convex Dishorner. I also make the Bucker Stock Holder, one of the best aids to dishorning, and two other styles of Dishorners, one for calves. Every approved appliance for this work. Send for FREE book. GEORGE WEBSTER, Box 64, Christiana, Pa. Western trade supplied from Chicago.

YOUR HORSE—— 50c and $1.00 a Bottle.

if suffering from an enlargement can be quickly put on his feet. No need to blister or fire. The enlargement will be quickly absorbed by

Sloan's Liniment.

Nothing like it to cure a sore tendon, or to kill a spavin, curb or splint. This remedy is known to more drivers and horsemen than any other liniment, because it does the work by its *penetrating* qualities.

Prepared by DR. EARL S. SLOAN, Boston, Mass., U. S. A.

Sold by Druggists and Dealers generally.

SALE OF ANIMALS.

What Amounts to a Warranty?

Animals are personal property and subject to all the laws governing such property. The sale of an animal must be completed by delivery to make it valid against the rights of third parties. The rule of "Caveat emptor"—let the buyer beware—applies to the sales of animals, where there is no fraud, concealment or warranty. It is a maxim employed in the law to signify that when a buyer has required no warranty, he takes the risk of quality and condition upon himself, and has no remedy if he chooses to rely upon the bare representations of the seller. To this rule there are many exceptions which are of particular interest to the farmer or stock-breeder.

If a man sells a horse generally he warrants no more than that it is a horse; the buyer puts no question, and perhaps gets the animal the cheaper. But if he asks for a carriage horse, or a horse to carry a female or a timid and infirm rider, he who knows the quality of the animal and sells, undertakes on every principle of honesty that it is fit for the purpose indicated. The selling upon a demand for a horse with particular qualities, is an affirmation that he possesses these qualities. Where a horse is bought for a particular purpose known to the seller, a representation that he is "all right," relied on by the purchaser, is a warranty not only of soundness, but of fitness for the use intended. But one selling a horse as safe and kind and a good family horse was held not to be liable to the purchaser's wife for injuries received in driving where there was evidence that he supposed the horse was to be used exclusively by the husband in his business, and none to show that he expected the wife to rely upon his representations to the husband. On the other hand, it has been held that where producers and dealers in horses for breeding purposes sell one to a person who, to their knowledge, wishes him for such purposes, is an implied warranty that the horse is reasonably fit for such purposes; and that he is not prevented through illness, weakness or other infirmities from being able to exercise breeding qualities.

Where horses are described in a bill of sale as "sound and kind," this amounts to an express warranty, especially where the purchaser has the peculiar means of knowing the facts which the seller possessed. A representation made during the sale of mules that they were "all right" is a warranty of soundness. So, where the representation was that a horse was sound, straight and all right, just such a horse as the buyer wanted, this was held to be a warranty; and likewise where representations as to the age and soundness of a horse were made privately by an administrator to one who subsequently bought the horse from him at auction. If the seller says at the time of sale: "I never warrant, but he is sound as far as I know," this is a qualified warranty, and the purchaser may maintain an action, if he can show that the horse was unsound to the seller's knowledge. So an affirmation that the horse was not lame, accompanied by the owner's declaration that he would not be afraid to warrant him, was held to be a warranty. Where mares were described in a catalogue as "in foal to," "stinted to" or "served by" certain horses, these expressions were held to amount to a warranty. A public statement by a seller of horses at auction that all these that were not kind and safe to drive single would be specified at the time of sale, is a warranty as to a horse sold without any specification, the buyer relying on the statement. The buyer of horses under a written bill of sale simply reciting the transfer with warranty of title, may recover damages for false oral representations of the seller as to their trotting qualities and pedigree. A warranty that a horse partly blind was "all right, except he would sometimes shy" was held to be substantially a warranty that he was "sound." The seller's statement that a horse was "all right' was held a warranty that his eyes were sound, and a representation that a horse was 14 years old was held to be a warranty that he was no older.

On the other hand, the statement in a bill of sale that a horse is "considered sound" does not amount to a warranty, Nor is a statement in a circular that a young stallion will "make his mark as a foal-getter;" it is merely an expression of belief as to what may be expected of him in the future. A statement in a handbill advertising the sale of stock that certain animals are "in good health and condition" is not a warranty that they are in such condition at the time of sale three weeks later.

When a horse was to be sold at auction without a warranty, and the seller on the day before the auction said to the purchaser, who was looking at the animal's legs, "You have nothing to look for; I assure you he is perfectly sound in every respect," and the purchaser replied, "If you say so, I am perfectly satisfied," and on the faith of his representation bought the horse, it was held that there was no warranty.

Courts have always considered that a man who buys a horse warranted sound, must be taken as buying for immediate use, and has a right to expect one capable of that use, and of being immediately put to any fair work the owner chooses. The rule as to unsoundness is that, if at the time of the sale the horse has any disease which either actually does diminish the natural usefulness of the animal, so as to make him less capable of work of any description, or which, in its ordinary progress, will diminish the natural usefulness of the animal, or has from disease or accident, undergone any alteration of structure, calculated to diminish the natural usefulness of the horse, such a horse is unsound. But in the absence of any guarantee or warranty of soundness the rule of Caveat emptor applies, and the purchaser has no remedy, neither can he return the animal and withhold payment of check or note. F.

HOW MANY EGGS IN A COW?

Can you inform me how much money can be got out of a bob calf or a Bologna cow by slaughtering and feeding to hens for egg production, adding value of hide to egg product? Cows weighing 750 pounds to 1,000 pounds live. E. G.

Westtown, N. Y.

Equal to Equal Weight of Corn.

I am in the market each year from November 1 to April 1 for horses or cows at $2 each. We dress them the same as beeves, feeding the offal to the hogs. If the weather is cold, the quarters keep until fed out; if it grows warm and the meat is likely to spoil, we feed more freely and the last is often turned over to the shotes. In cutting for the hens we use a steam mill, cutting the smaller bones in with the meat. If we are short of stock we break up the larger and harder bones with an ax and grind all together. When the weather is stormy we cut meat ahead, and if it freezes hard, break off a piece and let the hens keep busy picking at it, it keeps them happy as well as busy. We think this meat and bone is worth as much per pound as dry corn, besides giving a necessary element in egg production and health and thrift that cannot be got from grain alone. J. D. BUTTON.

Suppose that E. G. has 326 hens, where fresh Winter eggs are worth 40 cents per dozen; that his flock is properly housed, in good condition, but not laying. Also that his meat can be kept five months. If given two ounces each, or 40 pounds per week, 160 pounds per month, in five months 800 pounds (the average weight of a Bologna cow) will have been consumed by the 320 fowls. The above conditions are similar to those of a flock of 80 birds, experimented with this last January. At the end of the month they had laid 20 dozen eggs; 320 fowls at the same rate would yield 80 dozen. At 40 cents per dozen, $32. Need we go further in figures? The flock of 80 are steadily increasing in egg production, and even now, February 15, yielding from 20 to 25 dozen per week. The flock is being fed, first, two quarts mixed grain thrown in the litter; at noon, the house scraps, with beef and bone well ground up and mixed in; at night about four quarts warm cracked corn. During the coldest weather (temperature ranging between 20 and 38 degrees below zero) a light wood fire is built at night in their roosting room. Though, under the circumstances, exact estimates are impossible to furnish, those given should conclusively answer the question inferred, as to whether it pays to buy meat for hens and take proper care of them during the Winter, even at eggs down to 20 cents per dozen. W.

OLEO ROGUES.—F. J. H. Kracke, Assistant Commissioner of Agriculture for the district including Greater New York, sends the following list of oleo rascals convicted during the 10 days ending February 13: Louis Snyder, Astoria, $300 or 60 days in jail; Thos. Murphy, Jersey City, $200 or 60 days in jail; Matthew Wahl, Jersey City, $200 *and* 30 days in jail; Henry Bellman, Jersey City, $200 *and* 30 days in jail; C. C. Kuhlman, Jersey City, $400 or 90 days in jail; Chas. E. Morris, Jersey City, $200 or 60 days in jail. The first named is a grocer, and the following five wagon men.

Shropshires at Auction.

On account of serious illness in my family, I am obliged to retire from the farm. In connection with a sale of all farm stock and implements, I shall sell at auction, on Wednesday, Feb. 27, 1901, at 2 o'clock, my entire flock of pure bred Shropshires, consisting of about fifty ewes of different ages in lamb by "Chief Hill" one of the best imported rams in this country, a fine lot of ram and ewe lambs, and a few yearling rams.

These sheep are all in the very best breeding condition, and will be sold without reserve of any kind, to the highest bidder. All are registered. This flock is recognized as being equal to any in the State, and a rare opportunity is offered to secure bargains in Shropshires. Intending purchasers will be entertained at the Hotel Richmond. Free conveyance to the farm Credit of one year on approved interest bearing notes.

A. W. LAWRENCE, Auctioneer.

You won't be under any obligation whatever to buy it.
Test the National by the side of any other separator made. If you don't say the National is the best machine we'll take it back cheerfully. Write now.
National Dairy Machine Co.
Newark, N. J.

The Improved United States Separator
Demonstrates its Superiority in Canada
AS IT DOES EVERYWHERE ELSE

The following is taken from the report of Mr. L. P. Lacoursiere, Canadian Government Butter and Cheese Inspector, who followed the work of the United States and DeLaval Separators at a recent test at the Creamery of St. Annes de la Parade to determine which make the Officers of the Creamery would buy. The report covers two days' work of each machine and shows that the DeLaval skimmilk tests were .10, .11, .07, and .08, while the tests of the U. S. skimmilk were only .03, .04, .03, .07.

His summary is as follows:

	DeLaval Separator.	U. S. Separator.
Milk received	5605 lbs.	3952 lbs.
Average temperature	87½°	89°
Average speed	5825	8025
Total loss of fat	4.02	1.84
Loss per 100 lbs. of fat	1.55 lb.	.87 lb.
Total loss in cash	$1.15	$0.42

L. P. LACOURSIERE,
(Government Butter and Cheese Inspector.)

Sworn to before me Nov. 21, 1900.
T. E. LANONETTE, J. P. ex of C. C. Ste. Anne.

NOTICE.—The DeLaval lost **$1.15** in separating 5605 lbs. of milk, or **.205** on 1000 lbs., while the U. S. lost **42** cents in separating 3952 lbs. of milk, or only **.106** on 1000 lbs.; which shows that the DeLaval lost in actual cash practically twice as much as the U. S.

In other words, a Creamery separating 10,000 lbs. milk daily *would save in a year in butter fat alone by using the U. S. Separator* $361.35 *that would be lost by using the DeLaval Separator.*

The President and Directors, after carefully considering the Judges' report, *decided to purchase a No. 0 Improved U. S. Separator.*

This is only one instance among many where the

IMPROVED U. S. SEPARATOR HAS PROVED ITSELF TO BE A CLEANER SKIMMER THAN THE DELAVAL.

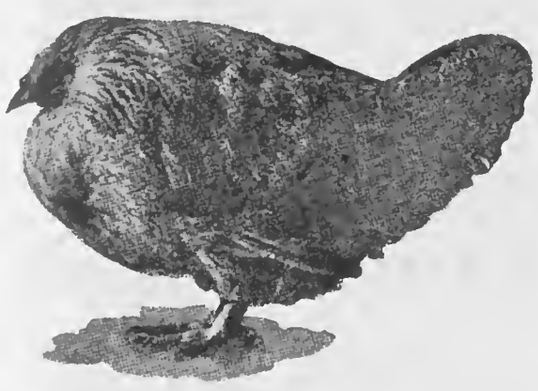
For further information and catalogues write the

VERMONT FARM MACHINE CO., BELLOWS FALLS, VT.

199.

CONSUMPTION IN POULTRY.

The Oregon Experiment Station (Corvallis) has issued in Bulletin No. 64 a very interesting account of several poultry diseases. Avian tuberculosis is a contagious disease almost exactly like consumption in man or animals. The germs of this disease, while growing in the body of the animal appear to be almost identical with those in mammals, except that they are larger and more vigorous. It has not been demonstrated that these germs will live and thrive in humans or animals. It was not found possible to inoculate guinea pigs with the fresh tubercles, although it cannot be said definitely that tuberculous hens are not dangerous as food. Several cases



A CONSUMPTIVE HEN. FIG. 53.

of this disease were studied at the Station, Fig 53 showing the appearance of the hen in the last stages of the disease. This hen was a grade Plymouth Rock. In ordinary health she would have weighed about four pounds, but disease had so reduced her that she weighed but 22 ounces. When examined it was found that the disease was largely in the digestive tract and liver, which were largely covered with tubercles. The lungs were not seriously attacked. The following statement concerning symptoms of the disease is taken from the bulletin:

The first noticeable symptom of this disease is, generally, lameness; the bird becomes more or less mopy, and gradually loses flesh until at the time of death it is a mere framework with feathers. The appetite is good throughout its sickness, at times it even becomes ravenous for food, and although it eats heartily this does not seem to appease the hunger. Toward the latter stages of the disease there is nearly always a persistent diarrhea, and the evacuations are accompanied by a discharge of a white or yellowish viscid matter. In all the specimens received, this matter was carefully examined, and in each case the tubercle bacilli were found in countless numbers. When the tubercle on the intestine reaches a certain period of its growth, there is a breaking down of the intestinal wall, and the germs are passed out with the feces, thus accounting for the rapid transmission of the germs from fowl to fowl, for in nine cases out of ten, the chickens' food is contaminated with their excrement.

To illustrate the danger of spreading this disease, the writer was called to visit a farm where it was found that 50 chickens had died of tuberculosis. In order to call

LEG OF CONSUMPTIVE HEN. FIG. 54.

the chickens together for our inspection, the owner scattered a handful of wheat on the ground of a run, where six choice blooded fowls had died some time previous; some of the wheat fell on the fresh excrement, and upon picking up several kernels with forceps, the under side of each was found to be soiled, but a chicken would not hestitate picking it up and swallowing. So if there were one sick bird passing germs, it would be only a matter of time that all would become infected. This offered an excellent opportunity to point out the danger of feeding in this manner.

In some cases the leg of the fowl is also attacked. Fig. 54 shows a case where the leg has been inoculated with the tubercle germ by picking it with an infected beak, or from some other external injury. The growth on the joints of the leg contains the germs in considerable numbers, and a hen in this condition should, of course, be removed from the flock at once. The bulletin states that, while there appears to be no record where consumption can be traced from fowl to man with fatal results, such a thing is always possible. The flesh of a fowl afflicted with Avian tuberculosis cannot be wholesome as an article of food, and should never be eaten. Another disease discussed is the ordinary one of scabies or scaly legs. A picture of a scaly leg is shown at Fig. 55 to indicate the difference between this and tuberculosis. As is now pretty well known, the scaly leg is caused by the presence of a mite which penetrates beneath the scales. This forms an irritation which results in white powdery crusts, which raise the scales on the leg from their position. The mites are found only on the inner surface of the crust, and in order to treat them properly the scales must be first removed. The leg should be soaked for a sufficient time in warm water to which some soap has been added. When they are well softened the loose scales may be removed without causing the leg to bleed. After this has been done the legs are dried and treated with a good coat of ointment

SCALY LEG IN HEN. FIG. 55.

made by mixing one or two drams of balsam of Peru with one ounce of vaseline. Where the crusts are soaked away and this balsam applied, a cure is not difficult. In cases of tuberculosis of the leg, which much resembles the scaly leg, the growth cannot possibly be removed in this way.

FEED FOR BROOD SOWS IN WINTER.

With many things Prof. Plumb has to say on the above topic, in answer to P. E. L., on page 89, of THE R. N.-Y., I fully agree, but with some I most emphatically disagree. He says: "Up to the last month before farrowing feed a ration half shorts and half cornmeal." Nothing could be much worse, except to increase the proportion of cornmeal. At no time after being bred would I feed a brood sow any cornmeal. It is constipating, fattening and heating, and contains very little of the material from which to build the bones of the young pig. Nothing so good as wheat middlings unless it be bran, reground so as to make it very fine. This is cooling, laxative, has plenty of bone material and also muscle and blood formers, and should constitute the entire grain ration. Artichokes and potatoes make a very good sow food, but I do not consider either as good as mangels, which are a very well-balanced ration, and he need not stop at three pounds a day. Nor would I cut them. It is better to feed them whole, as by eating them when so fed the sow will get the needed exercise.

We winter our brood sows in warm quarters, put them in roomy pens, 15 in a pen, 32x48 and nine feet high, and feed all the mangels they will eat, about a half bushel to a 350-pound sow. Give them all the good clover hay they will eat, and from two to three pounds of middlings or reground bran. If one has skim-milk it is a splendid addition, and may supplement a part of the middlings or bran. I would not make the grain food into a slop; just put enough liquid with it to moisten it so as to be eaten readily. If one believes with Prof. Plumb that they should have more exercise than they will get eating clover hay and whole mangels he should get into the pen and stir them around gently, but not more than necessary. We never take any trouble of this kind, and never under any circumstances let them out in the cold. Our sows farrow and raise on an average about eight pigs each and they come strong and active, and ready to help themselves, and P. E. L. may be sure that if he will so winter his brood sows he will never have a cannibal to deal with. Corn is all right to feed in a limited way to a fattening hog, but has no business to be made a part of the ration of a brood sow. Be sure to keep pens dry and well littered and then if sows want to root let them root, it won't hurt them.

J. S. WOODWARD.

RABBITS AND WHITE.—To keep rabbits from gnawing small fruit trees, we tie a strip of white cloth about the tree. The strip is perhaps an inch wide and two feet long. It is tied about two feet above the ground. The ends are left loose to flutter in the wind. It may be, as Ernest Seton-Thompson suggested, in his delightful book, Wild Animals I Have Known, that white is the rabbit's danger signal. At any rate, not a tree has been hurt, for two years, in an orchard of 700 trees, since adopting this plan. M. L. P.

SOME COW COMFORTS.

FOOD AND SHELTER.—The most critical time of the Winter for the cow is right now, and the wise dairyman is careful that all is done for the cow's comfort, health and happiness. It has been a long time since grass was browned, and it will be a long time till it greens again in the Spring. The memory of the past pasture has about faded from the mind of the patient cow, and the hope of that to come has not been born yet. Of course if her owner has been as wise as he should be he has provided an abundance of silage and good green hay and fodder, and is now supplying a balancing amount of good protein. I like my cows to be fed to fullness twice a day; to have water always with them, and not be compelled to build up their constitutions and general vigor too much out of doors. In fact, if I can't be among them in my shirt sleeves and be comfortable I want them in their stables. I have been using a silo for 15 years, and each year am more and more convinced that it is the best and cheapest place for storing cow feed, and in itself and its collateral usefulness is one of the most important of farm economics. I believe, too, that my experience is but the experience of all who have built them well and used them wisely, and why in our eastern country there is not at least one tub silo on each farm is beyond my comprehension.

THE GENERAL-PURPOSE COW.—I find her in much demand. I find also everywhere, some man who has found her, has tied to her, and is ready to stand up and swear by her, and at the fellow who does not believe in her. The wish is father to the thought. They are willing to own a plow and roller, and harrow and planter and reaper, etc., but they want a cow that will give 6,000 pounds of four to five per cent milk, make 300 pounds of butter, drop a calf each year weighing to the butcher 200 pounds, at six weeks old, and do all this on corn fodder, cob meal, straw, ice water and wind, and when she "gets up in years" fatten up to about 1,400 pounds for the aforementioned butcher. No wonder they sniff at me when I boldly assert the Jersey is queen of the dairy, and wears a chip on her shoulder.

SOILING.—Now, if you have never practiced soiling do try it next Summer, and now in the Winter of the cow's discontent is an excellent time to make plans and preparations. Don't depend on pasture. If you have it well and good. If you don't then you have the other. Plant plenty. If you find it getting old cut and cure, and plant something else. Keep something there to take up the plant food. First plant peas and oats, then corn, then sugar corn, then cow peas, then Soy beans, and more corn, and millet and rape and peas, but corn is king in his season. Every place that would otherwise be bare over Winter sow Crimson clover; and if it should fail any place scratch in rye; then there is always a place for the manure so it runneth not to waste in the Winter.

W. F. M'SPARRAN.

Sorghum in Orange County, N. Y.

On June 18 I sowed seven bushels, costing $1 per bushel, of Amber sorghum seed on 2½ acres of fresh-plowed ground; harrowed the seed in with a spring-tooth harrow. It came up quickly and grew fast until the dry weather checked it. I cut it with a six-foot-cut mowing machine the middle of September. It lay on the ground five weeks curing. It got one more storm on it than I intended, which discolored it somewhat. I raked it with a horse rake, pitched it on a wagon like hay with forks, and unloaded it with a horse fork and carrier. It yielded eight two-horse loads, which was about two-thirds of a crop, on account of the drought, as it grew from 10 inches to six or seven feet high according to fertility and moisture of ground. As I lacked seed a small corner was planted to corn fodder, which gave me a comparison, and until I drew the corn I was in its favor, but when I drew it, and since, I have declared in favor of the sorghum. It is the easiest and cheapest cut and handled, takes up smaller space, and fodders longer; is a good milk-producer, cows eating it up clean and with avidity. It is my intention to sow a greater quantity next season, and to sow earlier, as much of it did not reach proper maturity the last season with me. E. V. R. GARDNER.

Corncob Charcoal for Pigs.

How can I make good charcoal from corncobs to feed to hogs? Some advise digging a small pit, and then cover when the cobs are well charred. I wish to hear from some one who has experience in this matter. E. S. K.

Reddick, Ill.

ANS.—Prof. W. A. Henry, in Feeds and Feeding, a book which all stockmen should own, says: "The following directions for reducing cobs to charcoal are given by Theodore Louis: Dig a hole in the ground five feet deep, one foot in diameter at the bottom and five feet at the top, for the charcoal pit. Take the corncobs, which have been saved in a dry place, and, starting a fire in the bottom of this pit, keep adding cobs so that the flame is gradually drawn to the top of the pit, which will be thus filled with the cobs. Then take a sheet-iron cover, similar to a pot lid in form, and over five feet in diameter, so as amply to cover the hole and close up the burning mass, sealing the edges of this lid in turn with earth. At the end of 12 hours you may uncover and take out a fine sample of corncob charcoal. Charcoal so produced may be fed directly, or, better still, compounded as directed by Mr. Louis in the following manner: Take six bushels of this cob charcoal, or three bushels of common charcoal; eight pounds of salt; two quarts of air-slaked lime; one bushel of wood ashes. Break the charcoal well down, with shovel or other implement, and thoroughly mix. Then take 1¼ pound of copperas and dissolve in hot water, and with an ordinary watering pot sprinkle over the whole mass, and then again mix thoroughly. Put this mixture into the self-feeding boxes, and place them where hogs of all ages can eat of their contents at pleasure."

A Great Holstein Cow.

Another remarkable butter record has been made by a Holstein-Friesian cow. The cow, Beryl Wayne 32496, owned by H. D. Roe, Augusta, N. J., has completed an official seven-day test during which she gave 608.05 pounds of milk containing 22.298 pounds of butter fat, equivalent to 27.872 pounds of butter, 80 per cent fat. In the records of seven-day official test, as made by Holstein-Friesian breeders, by means of the Babcock test, this performance places Beryl Wayne as second only to her stable mate. Lilith Pauline DeKol 43434, whose phenomenal record of 28.236 pounds of butter, 80 per cent fat, made such a stir in the Holstein world a few weeks ago. Beryl Wayne was bred in Augusta, N. J., and was born March 8, 1892, her sire was Aaggie Prince of Wayne 8781 and her dam Beryl 3d's Empress 10536. The cow was milked every six hours. The largest yield in one day was 91.75 pounds of milk, which gave 3.37 pounds of fat. The test was made by H. C. McLallen and the retest, ordered by the Superintendent of Advanced Registry, H. F. A., by J. A. Foord of the Cornell Agricultural Experiment Station.

HAY FOR HOGS.—I have had no experience in feeding silage to hogs. Alfalfa and clover will never take the place of grain for fattening hogs, but makes an excellent feed in the Winter, when swine cannot get grass. I consider it an excellent feed for stock hogs; when chopped up and mixed with meal it makes a growthy and healthy feed. T. B. B.

Grafton, O.

"HOLLOW HORN."—Hunter Nicholson, in the Jersey Bulletin, says that this so-called "disease" is usually some form of indigestion. Here is his remedy: Powdered nux vomica, one dram; Barbadoes aloes, four drams; belladonna, one dram; powdered ginger, one ounce; sulphate magnesium, one pound. Give all at one dose, shaken up in two quarts of lukewarm water, as a drench by the mouth. After the medicine has acted, begin feeding the cow generously, avoiding constipating foods, such as cotton-seed meal or large quantities of corn or cornmeal. As a rule, the so-called "hollow horn" has been brought about by a hollow belly.

NOT HEREDITARY

In the main, consumption is not hereditary; it is infectious.

Low vital force is hereditary; which gives consumption its chance. An infection starts it.

Between the two, the crop is a big one: about one-sixth of the human race.

We suppose it needn't be more than 5 per cent, if people would take fair care and Scott's emulsion of cod-liver oil.

We'll send you a little to try, if you like.
SCOTT & BOWNE, 409 Pearl street, New York.

A Great Book About a Great Machine.

The new Cyphers Incubator Catalogue is without exception the handsomest and most complete book ever issued in the interest of the poultry industry. It contains 224 pages (8x11 inches) with more than 200 new illustrations representing the highest art of the engraver; the cover is a symphony of delicate gray tints with just a dash of red, and the text is devoted to sensible, practical poultry talk which every poultry raiser ought to read. It is an extremely beautiful book and as useful and practical as it's handsome.

The Cyphers Incubator during the four years that it has been on the market, has gained a popularity and achieved a success which is nothing less than phenomenal. And yet, its success is not hard to explain. The American poultry-raisers recognized in the Cyphers the first incubator really built on a scientific plan—a plan which follows nature's method in the diffusion of heat and the retention of the moisture of the egg, and they have found by experience that it is the only incubator which has successfully solved "the moisture question," and "ventilation question,"—being absolutely self-regulating in regard to heat, moisture and ventilation. Without question these two great features: self-supplied moisture and self-ventilation, were the original discoveries of Mr. Cyphers, and were brought to a practical working success by him.

The Cyphers Company puts out with every machine they sell one of the strongest guarantees we have ever seen on any machine of any kind. And the beauty of it is every poultryman in America can rest assured that it means *exactly what it says.*

We know that every one of our readers will be interested in this magnificent catalogue. Send 10 cents to pay postage, and ask for Book 101 Address Cyphers Incubator Company, Wayland, N. Y., Boston, Mass., New York City, or Chicago, Illinois.

AILING ANIMALS.

ANSWERS BY DR. F. L. KILBORNE.

Fistulous Withers on a Horse.

I have a mare that became very sore in the withers last Fall, as I supposed from being out in a storm and taking cold which settled in the withers. I doctored her, and let her be idle, hoping she would get over it, but she has not got any better, and a few days ago one side broke and it discharges a thick matter. Is it a case of fistula? Would I better try to heal the sore? What treatment would you advise? She is very sore yet on the withers, and I am afraid of losing the use of her.

Jasper, N. Y. R. W. W.

The mare has a fistula of the withers, which can be satisfactorily treated only by a competent veterinary surgeon. I would advise taking the mare to a veterinarian at once, before the fistula becomes deeper seated and more chronic.

Rheumatism or Founder in Pigs.

I have 10 pigs averaging 20 pounds each; they are in good thriving condition but do not seem to use their feet as they should. They seem to have a touch of rheumatism when they first get up, walk a few feet on their front knees, and show pains. They are fed principally on shorts, scalded; a liberal amount of bedding is given to them. Is there anything you would advise me to do or give to them? J. A.

Waterdown, Ont.

Give each pig two teaspoonfuls castor oil and repeat every third day until bowels move freely. Feed flaxseed or oil meal gruel, boiled potatoes, or other succulent food sufficient to keep the bowels open. Do not overfeed. Give a heaping teaspoonful of the following powders to every two pigs twice daily: Nitrate of potash, bicarbonate of soda and sulphate of magnesia, of each eight ounces, mix. See that the pigs are kept warm and comfortable.

Horse Blistered with Coal Oil.

About a week ago I came into possession of an 18-months-old black gelding that is very thin and weak from "roughing it." Before I got him a mixture of lard and coal oil had been applied to his back for lice; now the hair is falling out in bunches, leaving the skin naked but not raw. What shall I do for him? I am giving him a warm box stall, some corn fodder, clover, one quart of oats and one-third pint of oil meal, three times a day, but no medicine. He eats fairly well. W. V. R.

Deshler, O.

The hair would undoubtedly come in again all right without treatment. It requires a severe blistering to destroy the hair bulbs if the skin is not injured by the horse biting or rubbing himself. Some practitioners always anoint a blistered surface with lard, vaseline or other ointment, while others advise no application. If the skin is very dry, with a tendency to crack, the application of one part pine tar melted up with four or five parts of vaseline will prove beneficial. When the blistered surface has healed the following lotion may be applied to stimulate the growth of hair: Castor oil and alcohol, of each four ounces, tincture of cantharides one-half ounce; apply once or twice a week.

THE HEN AND HER EGGS.

Is it necessary to have a cock for hens, kept for the eggs only? That is, will a hen lay as many eggs without a cock as with one? How many eggs will a hen average per month when kept in good condition? How many months in one year will a hen lay? I am speaking of Leghorns. C. H.

Brooklyn, N. Y.

Male birds should never be kept with hens that are kept for eggs only. Not only will they lay fully as well without them, but their eggs will keep in good condition a greater length of time, besides saving the feed of the useless males. In laying, all depends on the hen and the month; Spring months being the natural time for hens to lay, they will under ordinary circumstances lay many more eggs than at other times. Some hens will lay an egg every day for a long time, while others in the same flock will probably not lay enough to pay for their keep. Here comes the advantage of the trap-nest system. The question is, can the laying qualities of the stock be increased enough to pay for the extra time required to attend to the nest and keep the records, which would be quite an item in large flocks? Good stock, well cared for, should average 150 to 175 eggs each per year. In some instances they may go 200 or better, but such records for large flocks are few, and 100 would come nearer the mark for the average fowl as ordinarily kept. Many hens will lay every month in the year; even when moulting they give us a few eggs, while others will take a long rest during the Fall and Winter months. Usually there are three or four months during the Fall and early Winter when you will get but few eggs from hens over one year old. The best way to get a supply of eggs all the year is to have March and April-hatched pullets to take the old hens' place in the Fall. If well housed and cared for they will keep up a fair supply of eggs until the next Fall, when they should be replaced with early pullets again.

J. E. S.

A TRUE "CROWING HEN."

With the possibility of throwing some light upon the subject of crowing hens discussed in THE R. N.-Y., page 795, last year's volume, I desire to submit a photograph of a White Wyandotte (Fig. 49) and the accompanying explanation. The subject of the picture was hatched in the Spring of 1899. In the Fall of the same year she was selected as one of 20 pullets for a pen. She was never seen upon a nest and so far as known never laid an egg. The male birds in the pen, two in number, were never seen to mate with it. During the Winter the feathers of the tail began to take on the appearance shown in the picture; they developed to a much greater length, and became more curved and sickle-like than is usual with females of this breed. The feathering of the neck and rump became full and heavy, presenting the general shape and outline of the hackle of the male. Upon close examination the feathers of these two regions were seen to be much longer and finer than those of the female, but not as much so as the hackle of the male. In detail of form and structure they were intermediate between the two. During the Winter the comb became well developed, likewise the wattles. They were smaller than those of the mature male, and considerably larger than those of the females. With the growth of the feathers of the neck, rump and tail, together with the enlargement of the comb, wattles, and spurs, the bird presented a distinctly masculine appearance. It moulted earlier in the Fall than the other fowls in the flock, the new feathers growing quickly.

In September it was sent to a taxidermist to be prepared as a specimen for the museum of the veterinary department of the college. The photograph from which Fig. 49 was made was taken after the bird had been mounted. A dissection of the genital organs revealed the presence of a diminutive uterus and oviduct. At the usual site of the ovaries or testicles were found an aggregation of nodular structures varying in size from a No. 4 shot to that of a cranberry bean. The largest of these were elliptical or bean-shaped, the smallest spherical. Section showed them to be quite firm and uniform in structure throughout. Owing to the bleaching action of the material used by the taxidermist for the preservation of the tissue the color of these glandular structures could not be determined. When the mounted specimen was placed before a group of students with the question as to what it was, some answered "A White Wyandotte cock"; others said, "A Wyandotte hen." Finaly one gave a correct answer by venturing the statement that it was "an hermaphrodite." JAS. B. PAIGE.

Mass. Agl. College.

WELL DRILLING Machines

Over 70 sizes and styles, for drilling either deep or shallow wells in any kind of soil or rock. Mounted on wheels or on sills. With engines or horse powers. Strong, simple and durable. Any mechanic can operate them easily. Send for catalog.

SATURDAY, FEBRUARY 23, 1901.

THE Agricultural Appropriation bill, as reported to the Senate, calls for $24,500 to be used in conducting an investigation into the character of food preservatives and coloring matters. This would seem a wise expenditure appropriately placed, for food adulteration of any class, or the use of deleterious so-called preservatives, reacts directly upon agriculture, and is therefore of moment to the farmer. As a matter for comparison, however, what shall we say of a $9,000,000 appropriation for the rich shipbuilders, and half that for the farming interests which form the foundation of National prosperity?

*

IT is a terrible thing to have a fire break out on the farm. One may go to sleep at night thankful for the comforts and blessings of home, and be roused before morning only to see that home eaten up by flames. One of our readers has just met with this sad misfortune. "It is a terrible thing," he writes, "to be without a home, but neighbors and friends have been so kind that it has made us realize that it would be much worse to be without friends." It is truly an awful thing to lose the home, but the depths of desolation are reached when standing by the grave of the home one must realize that he is without a friend! Such things occur every day in the great cities, but seldom or never in the country.

*

THE picture on the second page shows how the average Senator looked when the honest-butter people were done with him. He is plastered from head to foot with two-cent postage stamps—every one of which represents a personal letter urging him to vote for the Grout bill. He is a living illustration of the power of the postage stamp—of the combined force of pen and tongue. *The pen that writes the letter and the tongue that licks the stamp!* The only way to get those stamps off is to vote for honest butter. There is room for a few stamps yet. Let every friend of the cow invest two cents more in a postage stamp, and stick it to his Senator with all the force of his mind and pen. Right now is the time! "The brand of the postage stamp" is more useful than ornamental.

*

A SUBSCRIBER to THE R. N.-Y. wrote the Senators from his State as to the Grout bill, and from one got a very cheering letter. The other Senator, while having nothing to say against the bill, spoke of the many important matters before the Senate and doubted, considering the opposition, whether the bill would get to a vote. In reply our subscriber wrote the following suggestive letter:

Dear Sir: Yours of the 3d is at hand, and I have read it with anything but comfort. I know what an obstructive, dilatory body the United States Senate is. I know that oleo sold as butter pays a profit of 100 per cent or more, and that there is a lot of money back of the business. It is deeply humiliating to think that the United States Senate can be "held up" in the interests of fraud. Can't you get a law through allowing them to pass counterfeit money instead of counterfeit butter for a year or two, while the Senate gets time to think it over? If the present Senate is unable to wrestle with so palpable a fraud, and the Grout bill goes over, there is likely to be some praying done, and Senators as well as Members of the House may find that there is a God in Israel.

* * * * *

That is what we call "sticking a postage stamp." There are some smug and amiable people who can't understand how Senators and Representatives could vote against the army canteen. "All logic and facts are against it," they say. If they could read the letters these Congressmen receive they would quickly see how their so-called "logic and facts" are melted out of the minds of Senators by the red-hot sentiment that comes from the common people. It has been just the same with this Grout bill. A lot of wise human owls have talked about the "logic" of oleo, but mighty little of this logic lodges in the Senator's mind after a few hot ones right off the bat of the men who are not afraid to speak out.

*

As we go about the country we meet a good many farmers who think our social and economic conditions are all wrong. Few of them have a clear idea of what particular things are out of joint, but in a general way they believe that the strong and powerful are taking money and the common rights which belong to humanity away from the poor and feeble. In spite of the constant talk about "prosperity" it is a fact that the common people have a deep-rooted conviction that the income and benefits from American capital and labor are not fairly divided. It does not seem to have occurred to many of these critics and complainers that before they lay down rules of conduct for others they should themselves show in their daily lives examples of the strictest rectitude. Has any man the moral right to denounce fraud and selfishness in others unless he has taken something out of his own life and given it to humanity? We doubt it!

*

THERE is a bill before the Pennsylvania Legislature which aims to establish a division of horticulture and pomology in the State Department of Agriculture. The Commissioner and his secretary are to be appointed by the Governor to serve under the Secretary of Agriculture. The following amendment is to be offered:

Provided, however, that the Governor shall appoint one of three persons who shall have been recommended for the said office of Commissioner of Horticulture and Pomology, by the Pennsylvania State Horticultural Association at its next regular meeting.

This amendment certainly ought to prevail. What is the sense in making a Department of Horticulture unless the only organized society can have a hand and voice in selecting the commissioner? Another bill is designed to enforce the laws against diseases and insects that injure trees and plants. This bill would take power away from the local authorities and put it all into the hands of the Secretary of Agriculture. We are informed that there is serious opposition to this change.

*

WE print this week an interview with B. F. Van Valkenburgh, ex-Assistant Commissioner of Agriculture for this district. The substance of his complaint is that oleo offenders are tried in civil courts, where there is practically no publicity, as the offender can quietly settle the case through a lawyer. Mr. Van Valkenburgh says that if these oleo rascals were prosecuted in the criminal courts and sent to jail now and then they would soon get out of the business. The Attorney-General is responsible for sending these cases to the civil courts; both Mr. Wieting and Mr. Kracke do all they can to catch offenders and obtain evidence against them. From the statement made on page 130, it is evident that the criminal courts are now getting their share. That is as it should be. These oleo rogues are the meanest sort of criminals. There is no sense in being civil to them—giving them a chance to hush things up and keep their rascality away from the public. We understand that the Attorney-General defends his course on the ground that the civil cases bring in larger fines—more income to the State! Is the State of New York prosecuting the oleo rogues for the purpose of earning money, or because it really desires effectively to stop the sale of this fraudulent stuff?

*

ON the next page is printed a call addressed to fruit growers. They are urged to meet at Syracuse, N. Y., on February 27 and 28, for the purpose of organizing a fruit growers' association. The reasons given in the call showing the need of such an organization are sound and dignified, and will, we think, appeal to all sensible fruit growers. THE R. N.-Y. hopes that the new society will start right. It should not antagonize any other similar association, but should be organized on broad, liberal lines by strong, business-like men. Advantage should be taken of the mistakes which have been made in organizing other societies in New York State. Let us make it entirely independent of State officials or State appropriations. Too many so-called farmers' organizations are fostered and pampered by the State until they have little independence left, and do not fairly represent the working farmers. One great trouble with some of these societies is the fact that the officers are selected by a "nominating committee." We hope that the new society will never have any such committee, but that the chief officers will be nominated and voted for in the open meetings. True, this will take more time, but it will be time well spent. We hope that there will be an outpouring of fruit growers at Syracuse, and that they will not come prepared to turn over the management into the hands of a few men, but that they will demand and obtain a society that will give fair expression to their wishes and wants. After doing that let them go home and do their own part of the work.

*

IT is made clear by Mr. Bonham's article (page 122) that clover requires good soil or fair manuring in order to give a good account of itself. It is not the crop for restoring poor or neglected soil when one has little manure and no money with which to buy fertilizer. Is there any plant that will do this? Yes, the southern cow pea will make a fair growth in poor soil, and when the vines are plowed in the character of that soil will be greatly improved. One may take a soil so poor that clover will not grow on it, and sow cow peas with the certainty of producing a fair crop. Plow the peavines in and use a fair dressing of lime, and a catch of clover is as sure as it would with a fair coat of stable manure. During the past year experiments with cow peas were made at many of the experiment stations, and the results shown in manurial value are astonishing. We used to think that the cow pea required the entire Summer for its growth, but now we know that it is of great value when grown between early potatoes or oats and Fall-sown grain or grass.

*

HERE is a smooth game which some of the canning factories are trying to work. This note is from an old friend:

Since writing you in regard to canning factory contracts, I have learned that our factory people are refusing to let anyone grow sweet corn for their coming season unless they will also grow some peas, at the same time keeping the price the same as last year, making the growers take the whole risk.

Now see what a scheme that is! The factory people know that the Green pea-louse is more than likely to ruin the pea crop. They know about this, for they discuss it at their annual convention. The price of canned peas is sure to go higher. The farmers who have heard about this destructive insect are inclined to give up growing peas for a season at least, but the canner purposes to make them grow the crop, assume all the risk, but have no share of any probable profit! Sweet corn is a crop which many farmers like to grow. The canners know this, and they are sharp enough to try to put a "rider" on the corn crop by compelling the corn growers to plant peas. The canner takes no risk whatever under this deal, for he will get the price of the seed peas out of the corn. The thing is unequal and unjust—a fair sample of the one-sided contracts which farmers are expected to sign to their own detriment.

BREVITIES.

RURALETTES.

The square-toed hen well kept in tow
By food and shelter day by day,
The squarcness of her heart will show
By piping up her round de lay.

* * *

Of speakers who climb up into the cloud
At institutes, alas, we have no dearth;
Get up and notify them—right out loud
That most of those who listen are on earth.

* * *

What shall we do when the sulky crew
Of doubts go painting the whole soul blue?
Some take powders and some take pills;
Give me a walk on the lonely hills
Into the heart of the mystery
Of God and Nature; there, comes to me
A stronger hope and a clearer sight
And a truer faith in eternal right.
No house-bound prison with doubt for me
But the silent hills where the soul is free.

MORE soluble science on page 126.

NOT all the men with handles to their names are cranks.

WHAT do *you* say about rabbits and white color—see page 131.

MR. S. J. SCALE is of the opinion that there will not be an overproduction of fruits in the future.

To the many who are writing about the profits in growing witch hazel for distilling we wish to say—there is nothing in it.

ALFALFA; get good seed, give the soil the best possible preparation, sow 20 pounds per acre and cover with a drag or clod crusher.

IT's bad enough to take seeds of a common grass, label them "Billion Dollar" and sell at a high price, but it's like adding injury to insult to mix weed seeds with it.

How many eggs will a cow lay? That's a question some of our wise men will try to answer this week. The cow is a dead one cut and ground up into bone and meat for poultry food.

"THE people are the strongest and most intelligent I ever saw. Such handsome, rounded, cheery, rosy-looking women and girls I never saw before, except one now and then." That is what Mr. Van Deman writes about the "Palouse Country" in the State of Washington.

Events of the Week.

DOMESTIC.—A gigantic steel combination has been formed, including the Carnegie-Morgan-Rockefeller Interests, which allies companies having a capital of $1,000,000,000, and practically destroys competition in this country. . . . . The report of the joint commission on the Alaska boundary gives the United States about nine-tenths of the disputed territory. . . . . A fire at Evansville, Ind., February 5, caused a loss of $175,000. . . . . February 7 a limited express on the Erie Railroad was ditched near Greenville, Pa.; six persons were killed outright and 15 others badly injured. . . . . Delaware has passed a law fixing the death penalty or life imprisonment for kidnapping. . . . . A fire at Scranton, Pa., February 7, caused a loss of $400,000. . . . . Part of the Oriental powder mills, at Newhall, Me., was demolished by an explosion February 7; two men killed. . . . . By the bursting of a steam pipe on the new steamship Ventura, bound from Philadelphia to San Francisco, five men lost their lives. . . . . A cork factory at Pittsburg, Pa., was burned February 9, the fire spreading to an adjoining factory and machine shop; loss $750,000.

CONGRESS.—February 6, the Senate passed the War Revenue Reduction bill. An amendment substituting an income tax for the War Revenue bill was rejected. . . . . The House Committee on Banking and Currency, February 5, tabled the bill repealing the 10 per cent tax on State bank issues and the bill requiring National bank depositors to pay interest to the Government on public deposits. . . . . The Senate, February 7, passed the Pension Appropriation bill, carrying $144,000,000, after a few minutes' consideration. The House finally passed the Post Office Appropriation bill. The amendment to reduce the rate of railway mail pay was ruled out on a point of order; the amendment to continue the pneumatic tube service in New York, Boston and Philadelphia was abandoned with the purpose of making the fight in the Senate, and the motion to strike out the appropriations for special mail facilities was defeated. . . . . The Agricultural Appropriation bill reported to the Senate carries a total of $4,503,920, of which $158,820 was added by the committee. Among the amendments recommended is one to reorganize the eight divisions of the department into four bureaus. The divisions of pomology, agrostology, botany, vegetable pathology and experimental gardens and grounds are consolidated as the bureau of plant industry, and the divisions of forestry, chemistry and soils are made bureaus. Another amendment authorizes an investigation of articles imported from foreign countries which the Secretary of the Treasury has reason to believe are dangerous to health and provides for their exclusion if so found. An appropriation of $24,500 is inserted for conducting an investigation into the character of the proposed food preservatives and coloring matters to determine their relation to digestion and to health and to establish the principles which should guide their use. The establishment of a weather bureau station in Bermuda is authorized in order to complete the chain of stations in the West Indies.

PHILIPPINES.—A Spanish merchant in Manila and an American contractor have been arrested on a charge of dealing with the insurgents and paying assessments to the insurgent cause. The American, D. M. Carman, has a monopoly of carrying goods going through the Custom House ashore from the ships; he is a rich man, and possessed the confidence of Gen. Otis. . . . . The President plans to organize the Philippine municipalities, place the offices in the hands of intelligent natives and permit limited suffrage.

GENERAL FOREIGN NEWS.—Queen Wilhelmina of Holland was married to Duke Henry of Meckienburg-Schwerin February 7. . . . . The Rev. W. S. Ament, an American missionary, has been arrested with others in China, by the French and Russian troops, on the charge of extorting money from the Chinese. He denounces his arrest as an outrage, and asks Minister Conger to release him with troops. . . . . At Baku, Transcaucasian Russia, fire broke out in the oil wells and reservoirs February 6. The fire soon became uncontrollable; 500 persons are believed to have perished, and the loss is almost beyond computation.

FARM AND GARDEN.—Prof. S. A. Beach, of Geneva, N. Y., presented a paper to a meeting of the Royal Horticultural Society of England on January 15. His subject was "Recent Developments in the Treatment of Diseases and Insects Injurious to Orchard Crops." It was a resumé of the progress in the United States of the methods of fighting insects and diseases and was most instructive.

Twenty-five young men are attending the short courses in agriculture, horticulture, and the mechanic arts which are now being given at the Oklahoma College at Stillwater. They are studying the work of the experiment station very closely and are finding much that will be helpful to them when they return to their farms.

A deputation from the Ontario (Canada) Fruit Growers' Association visited the Canadian Minister of Agriculture February 1, to urge a careful system of inspection and fumigation to prevent the spread of San José scale. The Minister requested the Association to appoint a committee of three to coöperate with the government in securing precautionary measures. It is probable that the Provincial Legislature will take action in this line during its present session.

The annual report of the Canadian Minister of Agriculture shows an enormous growth in farm products in the past few years, while the exports to the United States are continually decreasing. Last year Canada exported wheat to the value of $11,995,488, while in 1896 the amount was only $5,771,521. The value of flour exported more than doubled in the same period, with even a greater increase in other grains. The greatest improvement was in cheese and butter. In 1896 the cheese exports amounted to $13,956,571, while last year it reached the sum of $19,856,324. In the same period the export of butter advanced from $1,052,089 to $5,122,156. Pork, bacon and hams advanced from $4.446,884 to $12,802,034, and eggs also about doubled. The report shows that Great Britain took no less than $4,947,000 worth of eggs. The United States bought only $5,044. The same is noticeable in cheese, as the United States only bought $4,836, which is $5,000 less than four years ago.

Edmund G. Harrison, special agent and road expert of the public roads division of the Agricultural Department, died in Washington on February 6, aged 72 years. He was an occasional contributor to THE R. N.-Y.

The American Saddle Horse Breeders' Association will meet at Louisville, Ky., April 5; secretary, I. B. Nall, Louisville, Ky.

Five students from Argentine Republic have recently entered the University of Missouri for special work in animal husbandry. Two of these are sent by the government for the purpose of becoming acquainted with American methods of instruction in agriculture.

Anticipating the repeal of the State Wolf Bounty law, a number of stockmen in the Bad River section of South Dakota have contributed a handsome sum from their own pockets, and will keep up the warfare. The State has expended $30,000 for wolf scalps, and the present Legislature is not expected to make a further appropriation.

The Eastern New York Horticultural Society.

THE FRUIT DISPLAY.—The fifth annual meeting of the Eastern New York Horticultural Society was held at the American Institute, 19-21 West 44th St., New York City, February 13-14. The attendance was very good, especially on the second day, and many questions were discussed in a profitable manner. The number of women in attendance was noticeably above the average at horticultural meetings. Geo. T. Powell, of Ghent, was elected for the new president, other officers being re-elected. The exhibit of apples was quite extensive, and may fairly be said to be superb in quality. Most of the specimens were models in color and finish. Ellwanger & Barry, Rochester, had a large and fine display of Winter pears as well as of apples. The standard apples shown by W. N. Teator, Upper Red Hook, were beauties in every way, though individual varieties were surpassed in other collections. The feature of greatest interest, however, was an exhibit of 14 plates of hybrids and seedlings of the famed Newtown Pippin, grown at Croton Point, N. Y. Crosses of the Pippin and Northern Spy, Greening and Russet, with the good characteristics of both parents plainly marked were shown, as well as new types. All seemed to be good keepers, and as far as tested the quality was excellent. We shall have more to say about these exceedingly promising novelties in a subsequent issue. Twelve plates of Lady apple seedlings were shown by another exhibitor, and were very beautiful, being larger and of brilliant coloring, ranging from bright yellow to a glowing garnet red. A new pear, said to be a hybrid between Bartlett and Winter Nelis, from Massachusetts, was in remarkably good condition for the season. It is very large and fair, of a good yellow when ripened, and of most satisfactory quality. There were many fine decorative plants from Siebrecht & Son, New Rochelle, and some little-known orchids from other growers. A very good display of roses and carnations in many new varieties lent attractiveness to the hall.

DISCUSSIONS AND OPINIONS.—The San José scale question excited much interest and discussion, and was disposed of by an indorsement of thorough inspection and the necessity of thorough fumigation with hydrocyanic gas of all nursery stock. Some points from the committee reports and question-box discussions are as follows: Apples in general proved satisfactory to growers who held their fruit. Early sellers got low prices. Peaches were plentiful and often small from overbearing. Those who thinned got fair prices. Strawberries were a satisfactory crop and brought good prices. Currants brought little profit. The crop was enormous. The yields of raspberries and blackberries were in most instances satisfactory, and the prices of good berries quite fair. Plums were much injured by winterkilling and curculio. Prices were good. Several of the Japans showed weakness. There is an increasing demand for Brussels sprouts. The secret of asparagus culture is heavy and constant manuring and thorough tillage. The Palmetto is the best and most resistant variety. No better tomato than the Trophy, introduced in 1868, has yet been developed, though some of the newer varieties have special points of excellence. Pears have been enormously injured in the last 25 years, and the dwarf Lima beans are a useful acquisition owing to ease of culture.

PETROLEUM FOR SCALE.—Some progress is being made in working out the petroleum cure for scale. Crude petroleum is more effective than either whale-oil soap, one pound to the gallon, or kerosene oil. The soap is good for Summer use. Petroleum in mechanical emulsion, 10 per cent, kills most of the scale; in 25 per cent, kills practically all, and has not proved dangerous. Crude petroleum is dangerous on account of varying quality and density. Leaf drop in peaches was bad last year in poorly-drained lands. The disease called "little peach" is spreading and is very destructive where it gains a foothold. A similar appearance is noted from the effects of overbearing, but the tree often recovers.

Floriculture has made gigantic strides in eastern New York during the last two decades, more than all other branches of horticulture. It has never asked the State for subsidies, but has stood on its own merits. The sale of plants and flowers during the past holiday season exceeded all records, amounting to over $1,000,000.

W. V. F.

To Fruit Growers.

We believe that the time is at hand when all those interested in fruit growing in New York State should consolidate their interests, join heart and hand, and be of mutual benefit, both in teaching how to grow their fruits, and in helping to sell the products. We all know that the average producer was made to believe that the apple crop of 1900 was equal to the crop of 1896. Whether this was through ignorance or intent we do not know, but if an organization, such as is contemplated, had existed last Fall, the members would have been in close communication, through their central head, and, after collecting and tabulating the information and sending it to the members, would have saved the apple growers of New York State alone many thousands of dollars. We also believe that through a State organization we can command attention in procuring shipping accommodations, cars at the proper time, the advertisement of dishonest commission merchants, cold-storage facilities, legislation, and aid in many other ways through their executive and legislative committees. These are a few of the many advantages that a strong organization can accomplish by its coöperation and unselfishness. Not only in these lines can we be of service to each other, but in producing finer and more salable fruit, and we would know better how to pack the same through closer communication of producer and consumer.

Therefore, we wish to call a meeting, to be held in Syracuse, in the assembly room of the Chamber of Commerce, February 27 and 28, at 11 A. M., for the purpose of forming such an organization. We earnestly urge the coöperation of all those interested in growing fruit in securing a good attendance at this meeting. We are promised the presence of J. H. Hale, of Glastonbury, Conn.; H. W. Collingwood, of THE R. N.-Y., and Prof. V. H. Lowe, of the Geneva Experiment Station. Certificates can be procured at nearly every station where coupon tickets are sold, when first-class fare one way is 75 cents, and return on one-third fare, on condition that 100 or more holding certificates attend the meeting. Headquarters at St. Cloud Hotel.

L. T. YEOMANS,
T. B. WILSON, Committee.

Prosecution of Oleo Cases

If violators of the law can escape with only a small fine and no newspaper publicity, much of the disgrace that should be connected with law-breaking is removed. Are dealers who are caught selling oleo for butter let off this way too easily? Ex-Assistant Commissioner of Agriculture Van Valkenburgh says they are. In a recent interview he said:

"During the 12 years previous to October, 1896, not a single oleo case in the Second District (including New York City) was prosecuted or settled in civil courts, except in cases where civil and criminal proceedings were instituted against the same person; and no milk cases, except where the milk was undoubtedly adulterated by the shipper, who was a non-resident of the State. In such instances the dealer was allowed to settle by paying the civil penalty, which he would deduct from the amount due the non-resident shipper. This system of handling the agricultural laws was continued until October, 1896. Since that date, and up to the Fall of 1899, nearly half the cases were settled by civil penalty, without going to court, after which date, as I am informed, the Attorney-General notified the attorneys assigned by him to the prosecution of violations of the agricultural law, that all cases must be prosecuted in civil courts only, except when given directions to the contrary. This is entirely contrary to the former policy, which held that nothing but criminal prosecution would deter violators of the law. To call at an attorney's office and settle by paying $25, $50 or $100 civil penalty, does not have much effect, as the dealer well knows that he can return to his place of business and make the amount of his fine in a week or two by continuing the sale of these goods in violation of the law. In fact, the manufacturers of the goods guarantee the dealers to pay all fines and penalties imposed. No publicity being given to his prosecution, he loses no credit. Other dealers hearing of no prosecutions under the law, naturally conclude that it is not being enforced. It seems to me that these cases are handled now in such a way as to make a record of a large number of prosecutions without having any effect whatever on the quantity of goods sold. In fact, this will lead to the sale of a still greater amount, as there is but little fear of criminal prosecution on the part of dealers who feel disposed to sell oleo as butter. The law might about as well be wiped off the statute books if this is the manner in which prosecutions are to be made. In my judgment, the worst blow ever struck at the agricultural interests of this State was the action of the Legislature in placing the selection of the attorneys in the hands of the Attorney-General, instead of allowing the Commissioner to secure his own counsel, as many of the lawyers selected by the Attorney-General are not experienced in criminal law, and especially not in agricultural law. The Legislature could not do better than to repeal this act and place the selection of counsel in the hands of the Commissioner, who is better acquainted with the requirements of each case."

IN some sections of North Carolina, the tobacco acreage will be decreased as much as one-third, and cotton will take its place. The high price of cotton this season is the cause.

IT is said that phylloxera is damaging vineyards in the neighborhood of Stockton, Cal., and experiments are being made with varieties of grapes which have the name of being resistant to this pest.

THE southern mule market has had a boom for the last three years on account of the increased demand for war purposes. The first of this month a British steamer left New Orleans for South Africa, having on board 1,500 mules.

THE crop in the celery-growing section of Florida is said to be large, and shipments will soon be made to the New York market. This Florida celery is usually superior in quality to that received from California, being more tender and not so strong in flavor. Some of the stalks of the California product are nearly two feet long, but inclined to be tough.

AT the beginning of this year a new market regulation went into effect at New Orleans. It forbids the opening of any private market within nine blocks of the public market section, and also prohibits peddlers from calling out what they have for sale, or in any way trying to attract the attention of people in the residence districts through which they go with their wagons. The idea of this new rule is to prevent the sale of unwholesome food by peddlers, and to increase the income of the city from the rental of the public markets. It has caused considerable hardship to outside marketmen, and some inconvenience to the public, and a strong effort is being made to have the law repealed.

Woman and Home

From Day to Day.

JES' A-FOOLIN'.

She sez to me: "I wisht you would
Jes' quit all time a-teasin' me.
Fr'm morn till night it seems that you
Don't fer a minit let me be.
Go 'way now, feller! Let me 'lone;
I never liked you much no how."
But say, she smiles when she sez that,
She's jes' a-foolin', I'll allow.

I go to see her Sunday night:
She allers sez she doesn't care
If I don't come, but why has she
Them bran'-new ribbins in her hair?
An' why's she got her best dress on?
Jes' tell me that, an' tell me now;
But still she sez she doesn't care,
Still jes' a-foolin', I'll allow.

T'other night I told her straight
I loved her, an' you orter see
That little flirt jes' tip-toe up
An' give th' sweetest kiss to me.
Ah-m-m-m! 'twas sweet, but still she said
She didn't like me much nohow,
An' then she laffed an' squeezed my hand—
Still jes' a-foolin', I'll allow.

—Chicago Post.

*

HONEY is a desirable addition to baked apples, especially at this season, when the fruit is likely to lose somewhat in flavor. Wipe or peel the apples, and remove the core without running the knife clear through. Into this hollow put a bit of butter and a teaspoonful of honey, and bake after the ordinary manner.

*

MISS ANNA BARROWS, of the American Kitchen Magazine, a well-known authority on domestic science, was recently elected a member of the Boston School Board by the greatest number of votes ever polled for any candidate to that office. Miss Barrows was one of the reform candidates selected by the Public Education Association. She is much interested in domestic science as applied to rural homes, and has been received very cordially as a lecturer at farmers' institutes.

*

WHITE petticoats have come in fashion again, and are already crowding the colored silk skirts aside. We realize that in spite of its attractiveness, the silk underskirt, worn long, as it must be under a fashionable dress skirt, becomes an unsanitary dust trap, whereas the easily-washed white cambric is always sweet and wholesome. Easily-washed, however, is hardly a correct descriptive of many of the white petticoats seen, for they have two—sometimes three—flounces, trimmed with diamonds and medallions of insertion, scalloped or vandyked flutings, and all sorts of elaboration. To wear under the thinnest Summer gowns a skirt of white lawn, cut like a dress skirt, and nearly as long, is very useful; it may be flounced, but without edging at the hem, any trimming desired being in the form of insertion. Such a skirt looks better than cambric or muslin under a very thin gown, and is not nearly so heavy in laundering.

*

IT is pleasing to note the prediction that the filagree shirt waist of last Summer will not reappear. There will be thin bodices of lawn and lace, but they will not be worn on the street. The array of white waists will be quite as extensive as before; those of tailor style will be of duck or butcher's linen, made quite plain, the sleeves puffed at the wrist, with a narrow cuff. Corded lawn is another excellent material for white waists. In colors, crushed raspberry and old blue, both light and dark, are likely to be very popular; madras and mercerized cottons being favorite materials. Polka dots and broad stripes are to be favorite patterns, also very complicated plaids of diverse colors. Sailor effects will again be popular, some waists having the regular blouse shape, while others are ordinary shirt-waist shape with a sailor collar, all having the shield in front, and the regular standing choker collar at the throat. The sailor styles are always becoming to slim and youthful figures.

*

OUR pattern department has just received an order for a skirt pattern from

3726 Girl's Costume
6 to 12 Years.

a reader at Lowville (no State), who gives the size wanted, but neither the number of the pattern, nor her own name. Consequently, the order must be held until a letter of inquiry is received, and in the meantime some busy woman in New York or Minnesota or Pennsylvania (for there is a Lowville in each of these States) will wonder why she does not receive her pattern. Perhaps she will see this explanation, and feel relieved thereby.

The Rural Patterns.

Bright plaids are still very popular for girls' dresses. The very pretty little costume illustrated is made from camel's-hair cheviot woven with much red and lines of black, green and yellow; and is trimmed with bands of black velvet ribbon. At the neck is a V-shaped shield of heavy cream lace over plain red, finished by a simple standing collar. The skirt is circular, with a single seam at the center back. The upper portion fits snugly and smoothly, but below the hips it falls in soft, undulating folds. The fullness at the back is laid in an inverted pleat, or can be gathered, if preferred. The waist is made over a fitted lining and, with the skirt, closes at the center back. The V-shaped portions are faced on to the lining and the waist proper is arranged over it. The backs are plain across the shoulders and drawn down in gathers at the waist line. The front is laid in two backward-turning tucks at each shoulder, which provide soft, full folds below, and also is gathered at the waist line. The sleeves are snug, but not over-tight, and are finished with roll-over cuffs. To make this costume for a girl of eight years of age 4¾ yards 21 inches wide, or 2½ yards 44 inches wide, will be required, with one-half yard for V-shaped shield and 10 yards of velvet ribbon to trim as illustrated. The pattern No. 3726 is cut in sizes for girls of 6, 8, 10 and 12 years of age; price 10 cents from this office.

The small boy's Russian coat shown is very stylish, and not difficult to make. The model is melton cloth in Russian blue, with lining of bright red, leather belt and handsome gilt buttons, but all colors are used, hunter's green, dahlia red and brown, with the blue having special vogue. In addition to the cloth, cheviot, velvet and corduroy are all worn. Linings are usually, and preferably, of silk, but lightweight cloth, flannel and mercerized materials can be substituted, and are durable as well as less costly, besides which they look exceedingly well. The back of the coat fits smoothly across the shoulders, but ripples as it approaches the lower edge. The fronts are snug at the upper portion, but allow perfect freedom below the waist. The fitting is accomplished by means of shoulder and under-arm seams only. The left front laps well over the right in Russian style, and the closing is effected with buttons and buttonholes. The pointed hood is an excellent and practical feature, and can be included in the neck seam or finished separately and attached, by means of nooks and eyes, beneath the collar ready to be used when needed, or can be removed when the days are mild. The neck is finished with a simple roll-over collar, which is all-sufficient when the hood is omitted. The sleeves are two-seamed and finished with machine stitching at the wrists. To make this coat for a boy of four years of age four yards of material 21 inches wide, 3⅛

A New Country

"The Valley of the Platte" is the name of a booklet we have published, which describes a new country just opened up by the building of a railroad from Northport, Nebraska, up the valley to Guernsey, Wyoming. There are great opportunities in this district for farmers and merchants. A copy of the booklet, with a fine map of the country, will be sent free on application to P. S. Eustis, General Passenger Agent C. B. & Q. R. R., Chicago, Ill.

BROWN'S BRONCHIAL TROCHES

Neglect of a Cough or Sore Throat may result in an Incurable Throat Trouble or Consumption. For relief use BROWN'S BRONCHIAL TROCHES. Nothing excels this simple remedy. Sold only in boxes.

Easy Harness

All harness, old or new, is made pliable and easy—will look better and wear longer—by the use of

Eureka Harness Oil

The finest preservative for leather ever discovered. Saves many times its cost by improved appearance and in the cost of repairs. Sold everywhere in cans—all sizes.

Rural Recipes.

O woman, if seeker
  Your way to gain
O'er man, the weaker,
  The means are plain;
Would you be able
  Vain man to rule,
The dinner table
  Let be your school.
You need no ballot
  To win your part;
Just tickle his palate—
  You touch his heart.
—Good Housekeeping.

Peach Turnovers.—One pint of dried peaches stewed and sweetened with two tablespoonfuls of brown sugar; flavor with nutmeg to taste. Make a stiff crust, not as short as for other pies. Roll out pieces the size of a saucer. Cover one-half of the crust one-half inch deep with the stewed fruit. Fold over, pinch the edges together and prick with a silver fork. Fry like doughnuts, preferably in cooking oil; powder with sugar and serve with maple syrup.

Hashed Veal.—Slice roast veal very thin, season with salt and pepper and shake a little flour over it. Next chop fine a medium-size onion and put it into a stewpan with a tablespoonful of good table sauce and an equal quantity of mushroom catchup; boil these together for two or three minutes and then add half a pint of rich veal stock; boil until it begins to thicken and then throw in the veal; let the whole boil for five minutes longer and serve with small squares of toasted bread.

Frozen Frizzled Beef.—This is a suggestion for our farm housewives, who often have a large piece of beef frozen solid during cold weather. Procure a round or rump sirloin steak about 1½-inch thick; roll up tightly, tie, wrap in a fresh napkin and let freeze solid. When wanted for use shave off as much as required and put into a frying pan which has a generous supply of butter melted and hot. Toss the meat shavings about till they begin to brown, then add water to make sufficient gravy; season well and thicken with flour.

Dakota Doughnuts.—Beat together well two eggs, three good tablespoonfuls sugar, one-half teaspoonful salt, dash of nutmeg; pour on this two large kitchen spoonfuls smoking hot lard, add one teacupful sweet milk, flour to make a very soft dough, two teaspoonfuls baking powder. Do not cut too thin, and do not have the lard too hot when you first put them in to fry, as they will crust over and not be light. Roll in powdered sugar when cold. These are wholesome, as they do not absorb the grease while frying.

Eggless Waffles.—Mix at night a batter with sour milk if you have it; if not, sweet will answer. To each quart of milk, with flour for batter, add one tablespoonful each of butter and sugar, one-half teaspoonful salt. If sweet milk is used add small quantity yeast or one-quarter compressed yeast cake. In the morning add enough baking soda to correct acidity—you will have to try baking a little to get it right.

Mock Duck.—Four pork tenderloins; slash lengthwise, rub with salt and pepper, fill with dressing made of bread crumbs, one onion, one egg, one-half cupful butter, salt and pepper to taste; tie together and bake in roaster. Serve with hot apple sauce made as follows: Pare and quarter (if large, cut in eighths) as many apples as the family appetite requires. Put a layer of apples in a granite or enameled shallow pan, put bits of butter, goodly supply sugar and dash cinnamon on the apples. Do this in layers till pan is full; add a little water and bake till rich and clear, not just barely done.

Potatoes Allemande.—Dry in the oven to a delicate brown slices of stale bread. Grind or roll these rather fine and measure one cupful. Add to this two cupfuls of cold boiled seasoned potatoes chopped into fine dice. Heat a tablespoonful of good lard and fry potatoes and crumbs a golden brown. Heat one cupful milk to scalding point, stir into this one heaping teaspoonful each of flour and butter, add one-half teaspoonful salt and a pinch of white pepper. Put potatoes into a hot dish and pour over it the sauce. The dish is good without the cream sauce.

Spaghetti with Brown Sauce.—Put a half-pound of spaghetti into slightly-salted boiling water. Boil half an hour, drain and pour into a buttered granite pan. Pour over it the following brown sauce: Heat three tablespoonfuls butter, stir into this two tablespoonfuls flour, stir till smooth. Draw to a cooler place on the stove and add gradually one cupful cold water, stirring constantly. Let it boil up, add one scant teaspoonful salt, one-fourth teaspoonful pepper, one teaspoonful catchup, simmer two or three minutes, pour over spaghetti, set it into the oven and let it bake 10 or 15 minutes.
